GREAT PROGRESS IN THE SCIENCE OF TUNNELING UNDER RIVERS.—Great progress has been made, it appears, in the tunneling of the Thames, in view of the construction of cable railways, the latter to run from the monument near London bridge, under the river, thence to the Elephant and Castle, one and three-fourth miles, with a further extension of one and three-fourth miles on the southward side. There are two of these tunnels, the construction of which differs from the ordinary practice, inasmuch as no brickwork is used, but a cast-iron tube made of six segments, each two and one-half feet wide and one and one-fourth thick, bolted together, forming the casing. The joints are made water-tight by hemp-packing. The casting of the clay, which forms the river-bed, is done by an improved machine that makes an advance cut by arms of five feet radius, this being followed by a steel shield one-fourth inch thick, which is forced forward by hydraulic pressure; a space one and one-fourth inch is left between the steel shield and the cast-iron casing, which is filled with liquid quick-setting cement, forced in through holes in the cast-iron segments, filling every space and making the casing perfectly impervious. The alleged advantages of this system are greater economy in construction, no danger of settling, and a rapidity of work equal to 11 feet per day. Another and important feature characterizing this plan is that when the tunnels, which run side by side under the river, reach the shore, the direction is somewhat changed and they run one over the other, thus avoiding the necessity of purchasing private property.

THE NEW YORK AND NEW JERSEY TUNNEL. Work is to be resumed in the fall on the tunnels under the Hudson river from the foot of Morton street to Sixteenth street in Jersey City. Ground was first broken for this great enterprise in 1874, but it was not until 1879 that active operations were begun. Three years later everything came to a standstill, owing to the death of Trenor W. Park, who was the chief financial backer of the enterprise. A little work was done on the north tunnel last year, but the means at the company's disposal were limited. Now, however, it is said some eminent capitalists have come to the relief of the enterprise, and it will be rapidly pushed to completion. Thus far about \$1,200,000 has been expended. It will require only \$950,000 to complete the north tunnel and \$1,250,000 to complete the south tunnel, exclusive of the cost for the ground for freight and passenger depots in New York. In view of the immense amount of business awaiting the opening of this underground highway between the two cities, it would seem that there ought to be no trouble in that wealthy community in raising all the money needed. Everything is in readiness to recommence operations at a moment's notice.

CONNECTING THE ATLANTIC AND MEDITERRANEAN.—The projected ship canal between Bordeaux, on the Atlantic, and Narbonne, on the Mediterranean, France, seems still to occupy the French mind. It would be a vast undertaking, comprising, as it does, a length of 330 miles, to save a voyage around Spain of 700 miles, at an estimated cost of \$130,000,000. It is stated that the plan also contemplates the construction of a railway track along its margin, so that by the use of locomotive towage a speed of seven miles an hour could be maintained by day, and also by night by the aid of electric lights. Thirty eight locks would be required, and the depth of 27 feet would allow of the passage of heavy iron-clads. It is the opinion of many persons high in political and financial influence that the undertaking will be commenced before long. That such a canal must be eventually constructed is beyond a doubt. With the construction of such a work, Gibraltar will lose much of its military value.

THE IDEA OF tunneling the British channel will not down. It crops out anew every year, and will undoubtedly be carried out some time in the near future. The objection of English statesmen to the enterprise is one of the standing jokes of the age at the expense of Johnny Bull. That representative individual cannot bring his mind to properly consider the fact that the danger of a French invasion via the channel tunnel could be made so slight in a few moments as to be utterly unappreciable. A single dynamite charge properly applied at the British end of the tunnel would instantly render it utterly impassable, while if there was a French army in the tunnel at the time the fate of Pharaoh's hosts in the Red sea would be a catastrophe which, in comparison, would be utterly insignificant.

The survey of the route of the Nicaraguan canal is reported to be completed, so far as fixing the general location of the line is concerned. The result of the present survey is the adoption of substantially the same line as that indicated by the preliminary reconnaissance made in 1885. It has been found, so the report goes, that the actual amount of excavation required will be somewhat less than the estimate based on the earlier examination of the ground. Altogether, the outlook for the future of this important work—which is especially an American enterprise—is most encouraging.

The United States consumes more rails and railroad supplies than all the rest of the world.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

PLYMOUTH CON.—Ledger, Aug. 25: This property is still idle and no telling when the long period of idleness is likely to come to an end. A report is in circulation that an effort will be made to open the mine on the first of next month; but so many reports of this nature have been circulated heretofore, which proved false, that very little dependence can be placed in these rumors. It is the universal belief that whatever fire may have existed in the mine, it has long since died out. One reason for the delay—and no doubt there is some truth in it—is that it would be impossible to work the mine now, if it were opened, owing to the lack of water. This is the season when water for mining purposes begins to wax short. The canal company only began to draw upon the Blue lakes reservoir recently. There has not, however, been such a great demand for water this season, owing to the stoppage of the Plymouth mines, and the supply in consequence seems to be larger than at this time last year. Still it is probable that it would soon be exhausted if the Plymouth Consolidated were to draw upon the canal. The most likely view of the situation is that an effort will be made to open the mine and place it in running order, so that when the fall rains insure an abundant supply of water, the mill will be prepared to recommence the work of pounding the precious metal from its native matrix.

MISCELLANEOUS.—The Amador gold mine continues to develop splendidly. The rich ore-body reported last week holds out remarkably well. Not much headway is being made toward the construction of the mill; but there is no hurry about it, as the mine is far from being in a condition to keep a 60-stamp mill in operation. The Zeile has not commenced sinking yet; but the putting in of the tank at the 800 level is nearly finished. From 15 to 20 stamps of the mill are kept running. The North Star shaft is down 640 feet and drifting at the 600 level will be started next week.

SUTTER CREEK GOLD MINE.—For the week ending Aug. 22, the mill has lost four days on account of slackness of water. At present the mill is running to its full capacity. The developments in the mine the last week are very encouraging. Upraise from tunnel No. 1 broke through to surface opened up a large body of ore which would keep 40 stamps in operation for years to come. The company is now contemplating an addition of one more stamp to their present mill and a permanent making shaft.

SUTTER CREEK.—The Wildman mill, which has been hung up for a couple of weeks on account of sinking, was started again this week. The dumps are all full. They intend to run the mill in the daytime only.

Calaveras.

SPARROW HAWK.—Chronicle, Aug. 25: Some very rich ore is being taken from this mine, located about half a mile south of Rich Gulch. The owner has prospected to the depth of 50 feet, coming upon a well-defined vein of quartz four feet in width in slate formation, with gouge or inches thick on the hanging and about four inches thick on the footwall. The vein shows a tendency to still further increase in width with greater depth.

GREEN MOUNTAIN GRAVEL MINE.—Work here is suspended for want of water. It is well opened up and the gravel is rich. As soon as water for motive-power can be obtained, work will be commenced upon a 30-foot breast. There is an eight-stamp mill upon the mine run by water-power under a pressure of 275 feet. Twenty-five inches are used and run through a 3/4-inch nozzle. Each stamp weighs 650 pounds, dropping a distance of 11 inches, with a speed of 90 drops to the minute. Quarter-inch screens are used, and during a run of 10 hours from 70 to 75 carloads are put through the mill. The extent of the gravel deposit in this mine will make it a first rate mining property for years to come.

Del Norte.

HYDRAULIC MINES.—Record, Aug. 25: The sale of one of our best hydraulic properties is reported, the buyers being San Francisco and St. Louis parties. O. D. Campbell and S. Peck, mining experts, who have been to Morick Hill looking at the mine of R. W. Miller and H. Mulkey, went below on the steamer Thursday. They have bonded the mine for 60 days for the Scott's Bar Mining and Milling Co. The amount of the bond is \$20,000. Wm. T. Grider, James Camp, John Titus, George Meamber, Mary P. Grider, L. F. Coburn and Jacob Marhoffer have located 93 acres in Siskiyou county for a placer mine.

Inyo.

SENDING ORE TO ENGLAND.—Independent, Aug. 25: During the past year Samuel Chalmers has made repeated efforts to sell ore from a mine in Deep Spring district, in the Inyo mountains, east from Alford. The ore carries copper and other metals. None of the reduction works in California or Nevada would offer satisfactory terms to Mr. Chalmers and he has made arrangements to ship his ore to Swansea, Wales. He can ship large quantities of the ore; he is now stopping out ore and sorting at the mine.

Mariposa.

ON THE FREMONT ESTATE.—Gazette, Aug. 25: The owners of the Mariposa estate have put experienced miners at work on the different mines on the Grant to prospect the hidden treasure stored there. The reports made of these operations will determine the future actions of this syndicate in regard to the property.

Nevada.

VARIOUS MINES.—Transcript, Aug. 26: The Badger Hill diggings, owned and run by the Quick brothers, have been idle for about 10 days. Grangers did it. The mine gave employment to several men. Its owners are cleaning the bedrock in their claim. The Bald Mountain extension at Forest City has struck lava in its gravel operations, and as a consequence is not working at much profit. The South Fork (also gravel), located in the same section, is looking well. The Red Ledge Company, whose works are situated midway between Pike City and

Forest City, have built a steam sawmill on their property and commenced last week to turn out lumber, which will be used in their prospective quartz-mill and in other buildings which they intend erecting at the mine. The employees of the Alaska mine were docked 10 per cent on their last pay-day. The agreement under which the men work is, that they are to receive \$3 a day if the mine produces enough to allow of it, after deducting the running expenses of the month. Owing to the purchase of dies and other material last month, Receiver Jackson had to pay off at the rate of 90 cents on the dollar. During the week we were shown several pieces of rock taken from the Junction ledge. The quartz was heavily charged with sulphures, while here and there a speck of the precious metal was to be seen. As we stated last week, the ore from the Junction contains a number of metals, of which gold, silver and copper are thought to be present in quantities sufficient to warrant the rock being worked for all three.

Napa.

OPENING A SILVER MINE.—Callistogian, Aug. 22: The shaft of the Callistoga Consolidated Mining Co. is down about 40 feet. It is being sunk at the side of the vein. At a depth of 50 feet they will crosscut the vein to ascertain its width and value there; if satisfactory, then the shaft will be continued down 50 feet further, and preparations made for opening the mine. Where the quartz has been cut a little in sinking the shaft thus far, the indications are very favorable for finding good ore.

Placer.

RICH SPECIMENS.—Republican, Aug. 25: Some of the finest and most beautiful gold specimens found in the country continue to come from Duncan Hill. The gold is of a peculiar texture like fine lace, and rich is no name for it. The White boys out there are doing well in their claim, and old miners say the hill is just full of gold. There must be plenty of it where there are so many good prospects.

MAYFLOWER.—The tunnel here is being pushed ahead, and Sunday morning was in 5261 feet. At the Live Oak they are running a drift to connect with the Naugatuck tunnel by a raise from the low tunnel. The raise has passed 15 feet of quartz gravel. The ground is very wet from the large quantity of water pouring down. There are good expectations from the present work.

ALONG THE MIDDLE FORK.—Supt. Dodge has run a tunnel, 150 feet in length, across the upper end of Boston Bar, through which he has turned the river. This tunnel is 1800 feet above the cut in Horse-shoe Bar, which was run last winter. He is now stripping and working this 1800 feet of ground with good results. Breese & Wheeler have cleaned out the cave in the breast, and are putting on a large force of men. The Baker Divide is still running its prospect tunnel ahead. Gen. Hamilton has got the boiler in position at the Dardanelles mine. The mill has been running since Monday. The gravel is very rich. Few men are employed at the Red Point mine just now, owing to the lack of water. The company is laying water-pipe in the ditch. Quite a large force of men is at work at the Hogsback.

Plumas.

VARIOUS MINES.—National, Aug. 25: The Edman mine is paying better than ever. It is marvelously rich. The Pittsburg Co. has its tunnel in about 200 feet on the Poplar valley quartz, with good indications for a paying ledge. It is reported that the Bell mine is about to be again opened up by some lower country parties. Orr, Bushman & Co. start their quartz-mill on Black Hawk to-day. The big tunnel on the Consignee mine, at the mouth of Jamison, is progressing very favorably. F. B. Whiting has built a house and made many other improvements at French Ravine, and will commence work on the ledge immediately. Rich developments may be expected in the near future. A shaft is to be sunk on the mine on Chapparel hill.

Sierra.

PORT WINE.—Mountain Messenger, Aug. 25: Considerable prospecting is in progress hereabout, and many tunnels have been started. At Waboo, two miles southeast of Port Wine, 23 men are employed. The main tunnel is in 1700 feet and will soon be in pay gravel. It is expected that 150 men will be working here next year. John H. Frissel, contractor, is making good headway with the tunnel.

ST. LUIS.—Tunnel of the Excelsior Drift G. M. Co. is in 554 feet, and an air shaft is 350 feet from tunnel mouth. Enough T steel rail is on hand for 2000 feet of tunnel, 600 feet 7-inch air-pipe, black-smith shop and boarding-house. A good wagon-road, three-quarters of a mile, extends to the Port Wine and St. Louis road. Gravel is expected 250 feet ahead. Two shifts, two men each, are working. Rich gravel has been taken out of the adjoining Caledonia claim.

BUNKER HILL.—Nick Berets is busy as usual at Bunker Hill, and hopeful as ever of happy results. At Deadwood, under the direction of Mr. S. Miller, Liberator Co. is extending its main tunnel. They had some pay gravel down an incline and water drove them out. Bunker Hill Co. run its main tunnel northeast, thence the branch tunnel, to tap 42 shaft southeast with fair-looking gravel in face of the branch main tunnel. Seven men are working in the mine.

Siskiyou.

RICH STRIKE.—Union, Aug. 25: Considerable excitement prevails on Humburg over the discovery of a rich gold-bearing ledge near the Eliza mill. The find was made by Thornton Thomas, known among the miners as Big Tom. The ledge is ten inches wide and is so thoroughly impregnated with gold that it can hardly be broken off. It is said to be the richest discovery ever made in the country.

VARIOUS ITEMS.—Yreka Journal, Aug. 29: The Hegler boys and Bruce Aldrich have been crushing quartz steadily all summer at their mill on Humburg creek. Water is getting short, however, during the middle of the day, and may oblige them to shut down awhile if the hot weather continues much longer. One of the Lemay boys is now busy hauling quartz from the Siskiyou mine to the Orr & Pyle mill at forks of Humburg, and as soon as it is crushed a lot of quartz on the dump of the old Cornish ledge will be hauled down for crushing. H. L. Herzinger, who has been working successfully a drift-mining claim on Klamath river, nearly under the Anderson ferry, in Siskiyou county, will open another similar claim on Oregon bar, further down the river. He reports the country about the Klamath

and the streams emptying into it being well prospected now. A large number of men are scouring the hills, and some report promising finds. Mr. J. H. Crossman, of the State Mining Bureau, an expert in mining matters, has just returned from a month's trip to the Salmon river section and along Klamath and Scott rivers, in his researches. During his trip he has discovered very rich mining-fields and many natural curiosities of great benefit to the scientific world.

Trinity.

ON STEWART'S FORK.—Journal, Aug. 25: Good quartz has been found on this stream, the ledge being about 10 feet wide and the rock going from \$10 to \$20 or \$30 per ton. Further developments will be made soon.

KNOW-NOTHING CREEK.—The mines here are looking very well. The discoveries made last spring are developing favorably, and more new discoveries are frequently made. The Hansen mine is looking about as usual. The arastra is kept running constantly on good ore with satisfactory results. The company is now running a deep tunnel to tap the vein at a depth of 150 feet, which will give them a large area of stoping ground. They are now in 225 feet and expect to strike the ledge at any time, probably within a distance of 20 or 30 feet. A track is being laid and cars will be used in running out the ore as it is stoped out above. The Know-Nothing mine is developing well. The ledge varies from 6 to 20 inches and consists of good milling ore. The timbers are out for the four-stamp mill and the machinery is on the ground. An ore-chute and bin have been built, holding 150 tons of ore. A flume is in process of construction, three-fourths of a mile in length, for the purpose of bringing water to the mill. The water-supply is enough to run the mill the year round. It is expected that the mill will be running by the first of November. The Hungry Hill mines have closed down for want of water. The others are well satisfied with the season's run, and as soon as the fall rains set in operations will be resumed. The Gilta mine has been leased by Hancock & Junkins. They have sunk or it 20 feet and are well satisfied with the indications for a good property and good pay for their labor. There are now about 50 men in the camp and everything presents a lively appearance.

Tulolumns.

STRIKES CONTINUE.—Independent, Aug. 25: Strikes of more or less value are continually coming to light in some of the mines. Reports of this week state that the two Phillips brothers, working a mine near Quartz mountain, have taken out considerable money lately, and that the rock goes \$25 to the pan. We hope the chute will stay with them.

NEVADA.

Washoe District.

COMSTOCK MINES.—Territorial Enterprise, Aug. 27: The ore-producing sections of all the leading mines are looking well, and such companies as have command of milling facilities are extracting all the ore that their mills can reduce. Others, not being able to mill their ores, are extracting none. They are taking advantage of the vacation to put their mines in thorough repair. Also they are making extensive explorations for the purpose of opening up bodies of ore for further reference. At the Brunswick mill (where steam-power is in use) the usual amount of Confidence ore is being worked. The Alta steam-mill at the mine is running steadily. The concentrates are rich—worth \$500 a ton. The Justice folks are grading a site for a new mill. It will be a short distance below the mine, on the site of the old Woodville mill. There are on the dump, ready for reduction, 2500 tons of ore. The dynamos for the Nevada mill have not yet been received. All is now running well at the California battery and pan mills as regards the transmission of power. Times will remain as at present until the fall rains give a milling stage of water in the Carson river. Below we give such information as we have been able to obtain in regard to the leading Comstock mines.

CON. CAL. & VIRGINIA.—The east crosscut from the south drift on the 1300 level is still being advanced in a mixture of quartz and porphyry showing metal. On the 1300 level are continuing to extract ore from the southeast drift run from the upraise parallel north drift, 58 feet above the track floor. On the 1600 level the stopes around upraises Nos. 1, 3 and 4 are yielding the usual amount of ore. From the south drift from the Ophir line, 36 feet above the track floor of this level, ore is also being extracted.

ALTA.—All is running well and smoothly in both mine and mill. The ore now being worked comes from the 825 level. The station at the 925 level is completed, and a drift from that point out toward the vein is out 60 feet. The concentrators work well. They save from 15 to 16 tons of concentrates a month, which average about \$900 a ton. Good headway is making in the Keystone shaft, now down 216 feet.

HALE & NORCROSS.—All the ore-producing sections of the mine continue to look well. Are shipping about 600 tons a week to the Nevada mill. The most of this comes from the 600 and 700 levels. The average assay is \$42 a ton. The west drift from the 500 station is out 110 feet. Repair work on the main shaft is continued. A good deal of work is being done in the way of exploration.

BELCHER.—The 500 crosscut is now in 181 feet, with no change in the ground to report. Have completed the work of putting in guides in the middle compartment of the shaft and are making excellent progress in repairing the south compartment. The Suro tunnel drift is out 615 feet. The rock is hard but blasts well.

BEST & BELCHER.—El Dorado level: West crosscut No. 1, started from the main northwest drift, has been extended seven feet; total length, 82 feet. The formation is clay and quartz. Are repairing the north drift on the 1300 level.

CROWN POINT.—On the 700 level the south drift from the main crosscut is 71 feet. The ground shows no change worthy of note. The drift from the Suro tunnel level is out 615 feet. The rock is hard but blasts well.

UTAH.—On the 372 level the north drift has been extended 50 feet; total length, 492 feet. The formation is porphyry, showing some water.

CONFIDENCE.—A good deal of repair work is being done in all parts of the mine, yet the usual

shipment of 180 tons of ore per day is being made to the Brunswick mill. The average assay value of the ore is \$26.58.

WEST YELLOW JACKET.—Raising in high-grade quartz. Have not yet connected with the incline, are nearing it and likely to make the connection any day. This connection will give a much-needed circulation of air.

UNION CON.—Work on the 1300 level is suspended. Good progress is making in the joint Mexican drift on the 1465 level. It will reach the Mexican line in a distance of 250 feet.

OPHIR.—On the 1465 level the old east drift is reopened 153 feet. The southwest drift from upraise No. 2, 36 feet above the track floor of this level, is still being retimbered.

OCCIDENTAL.—Upper tunnel; 150 feet below the upper tunnel, in the boiler winze, the south drift has been extended 6 feet; total, 60 feet.

SIERRA NEVADA.—East crosscut No. 3, on the 520 level, is out 214 feet. The face is still in porphyry. There is a small flow of water.

ANDES.—On the 320 level the north drift is still showing some ore. The drift south on the 240 level is in a promising streak of quartz.

IOWA.—All in and about the mine is in good working shape. No change in any part worthy of note since last report.

CHALLENGE CON.—Prospecting on the 1000 level and some repairs throughout the mine are still being carried on.

CON. IMPERIAL.—Repairs to the main north lateral drift on the 1700 level are still going on.

BULLION.—Are drifting south on the 650 level and are crosscutting east on the 500 level.

SEG. BELCHER.—Timbering and repairing is the principal work at present in progress.

SAVAGE.—Owing to lack of milling facilities no ore is being extracted.

Belmont District.

ON THE SPANISH BELT.—Courier, Aug. 25: The Barcelona mine, Spanish Belt, is looking well. The south end of the mine is producing rich ore, some of it assaying as high as \$3000 in gold and silver. We would like to see the Monitor Belmont mill repaired, and the high-grade ores reduced at home. They ought to be just as successfully treated here as at Salt Lake or San Francisco. The low-grade ores will be concentrated at the Belt as soon as the new mill is built. The Barcelona will be an extensive producer of the metals. The lone chloriders are shipping their ore to Sodaville for treatment.

Candelaria District.

MOUNT DIABLO.—Walker Lake Bulletin, Aug. 25: Have stopped the west drift on the sixth level and are sinking on the ore found in this drift, and have about six inches of \$30 ore showing. The north crosscut between the fifth and sixth levels on the east side is in 116 feet and shows ledge matter in the face assaying \$19 to-day. The stope between the fourth and fifth levels, near the one winze, shows about three feet of \$80 ore. The east drift between the fourth and fifth levels is in 214 feet and the face shows some low-grade ore. The stope above the fourth level, near No. 2 winze, is giving some \$80 quartz. We have started a stope on a bunch of 570 quartz between the second and third levels east of the shaft, and the prospect is favorable. The hanging stope between these levels west of the shaft shows two feet of \$100 ore. The ore in the east stope on the second level is of rather low grade, averaging about \$35. The intermediate stopes between the first and second levels are yielding the usual amount of ore. The mill has been running steadily during the week.

ABOUT HAWTHORN.—The Kinkead mill is now crushing ore from the New York. Jim Waddell took a small lot of rock to Pollard's mill, Silver City, last week. Eight bars of bullion, four from the Mount Diablo and four from Garfield, were shipped below last week.

Taylor District.

RAINS AND MINES.—News, Aug. 25: The Monitor Co. is shipping \$1000 a week. Most of this is produced from tailings. The late rains have played the mischief with the roads between here and Eureka, which has made our mails a little late for the past few days. The heated spell is over and we may now look for fall weather.

Tuscarora District.

RICH COPPER ORES.—Cor. Silver State, Aug. 21: A district rich in high grade copper ores is now being opened in the northeastern part of Elko county, up near the Idaho line. Some ore was taken out here and shipped East 10 or 15 years ago, but it did not pay, as the price of copper ore was then very low while freight charges were very high. Under present changed conditions it is thought these mines can be worked with profit, as the deposits appear to be large and the ore carries a high percentage of copper with some gold and silver. For a month past four miners have been at work taking out ore. Shipments will be made from this point to Argo, Colorado, at once—in fact, two "sixes" are now on the road with ore for shipment. It is their intention to ship a carload a week. The new camp is attracting a good deal of attention from Idaho parties. At least a score of locations have been recorded in addition to those made by DeLano & Allen. Scarcely a day passes without some new prospecting party making its appearance in the district. It is 50 miles from Wells, the nearest railroad point. DeLano & Allen are trying to arrange for the erection of a smelter. They have unbounded faith in their properties, and are sure that they can make a success when a smelt r is erected on the ground.

ARIZONA.

MOHAVE REGION.—Miner, Aug. 25: At the sampling works the following lots of ore were run through last week: Jamison & Stinson, one car; C. O. D., two cars; Morrissey & Winston, one car. The lessees of the Hackberry mine shipped a carload of ore this week. The claim recently discovered by Henry Ewing in the Peacock mountains near the Crescent mine is looking well and considerable work will be done on it in the next few weeks. The McCracken mine, under the management of Judge Murphy, is being cleaned out and put in good working shape, and everything bids fair for the resumption of work on this property at an early date. John Morrissey was in town this week, having a 12-ton lot of ore from the Oro Plata worked at the sampler,

Morrissey & Winston have a lease on a portion of this mine, and expect to make frequent shipments hereafter. M. D. Howell of the C. O. D. Mining Co. was in town this week looking after a shipment of two carloads of ore. He will put about 15 more men to work in the mine this month, and hopes to largely increase the output. The Signal Mining and Milling Co. has got to a point in its mining operations where it becomes necessary for the economical working of their mine that they procure hoisting machinery, and it is not definitely known whether the company will go to this expense or not. The latest news from the O. K. Mining Co., which is prospecting for water in the Wallapai Valley, is that the well is down to the depth of 200 feet and still in loose gravel, and that the work is temporarily suspended, awaiting the arrival of more pipe, which is expected every day. The lessees of the Crescent mine have struck in the bottom shaft at a distance of 160 feet, from 8 to 14 inches of silver ore, which will assay from 200 to 1400 ounces. Messrs. Barrett, King, Pierce & Opie have been at work about two months cleaning out the mine and sinking, and can now reap the reward of their labors. Mendes & Rogers have a lot of ore from their gold claim at the sampler. John Campbell and B. Moses are working the Sinclair mine at Mineral Park, and are getting out some very good ore. The American Flag boys had six tons of ore brought down this week, which went, as all ore from that mine does, in the neighborhood of 600 ounces per ton. John K. Mackenzie had a six-ton lot of ore from the new strike in the Cupel worked this week, and it brought him 262½ ounces per ton. There is a good deal of this same class of ore yet in the Cupel. The sampling works this week worked the following lots of ore: C. O. D., two cars; Cupel, six tons; Waterbury, Carey & Gordon, one car; American Flag, six tons; Steve Smith, from the Attata, six tons; H. P. Ewing, a small lot from the Short Starter. A new strike has been made in the Rattan mine in sinking the shaft. The ore in the new strike is of different character from that heretofore struck in this mine, and assays \$50 in gold and \$150 in silver, and the pay streak is about eight inches wide. H. P. Ewing was in from the Peacock mountain with his first lot of ore from his recent strike, which he calls the Short Starter. It went 352 ounces to the ton.

ORE MOVEMENTS AND DEVELOPMENTS.—Prescott Courier, Aug. 27: Shull & Austin's big freight trains arrived recently from Congress mine with 24,000 pounds of shipping ore, left yesterday for the mine with a lot of machinery, including a boiler, which weighed 8000 pounds. Great activity is reported at Jerome. Smelter running, four saloons, two stores and another going up, roads leading to the camp crowded with men and teams. An enormous body of lead ore has been developed in the Lead Chief mine, Black Rock district, below Walnut Grove dam. Plenty of running water and timber in immediate vicinity. Eight tons of ore which Geo. Sines had run through the sampler yesterday went 555 to the ton. The Rapid Transit mine in the Bradshaw district is yielding very rich silver ore, some of which will soon be brought to the Prescott sampler for treatment. The mines belong to the same group as the Oro Bonito, Oro Bella and Mollie Stark. People who have seen the mines are enthusiastic in their praises of same, and it is predicted that it will be the banner mining camp of this section.

BRITISH COLUMBIA.

KOOTENAY.—Donald Truth, Aug. 18: At Porcupine creek enough lumber has been whipsawed for sluice-boxes, etc., and the creek turned from its bed in several places. Two of the companies will begin washing next week, and, no doubt, gold dust will be a common medium of exchange and barter in Donald within a month. Work on the Constance and Atlanta group of mines at Jubilee is progressing in the consolidated shaft as rapidly as three shifts of men can send it down. They are running through pockets of ore that look rich, and the indications are favorable for striking the ledge at no great depth. When they do, it will increase the value of every location on the mountain 100 per cent. The canal to connect the Columbia and Kootenay rivers at Grohman is progressing well. Two-thirds of the work is already completed, and the contractors, Sinclair & Gamble, who are carrying out the work for the company, are about to commence the lock. There is a hunt for tellurium and gold in the Windermere district.

COLORADO.

ABOUT CRESTED BUTTES.—Pilot, Aug. 25: The summer is rapidly passing away and the mines that we had expected to be active in shipping ore are pretty much in the same condition that they were last winter. It is true there is a carload of ore shipped occasionally, but for the number of mines and the amount of mineral there is in this country there should be several carloads shipped every day. The present developments of the Tennessee tunnel in Ruby Hill show the rock to be a black lime, which is a very good indication of mineral. Put is very hopeful of striking a good body of mineral very soon. A contract of over 20 feet has just been completed on the Buffalo lode by George Hale and Gus Schuman. This claim is situated in Poverty gulch. The contractors report the vein looking better when they quit work. The Metzler concentrator shipped a carload of concentrates that were made from Ruby Chief dump this week.

COKE AND COAL.—Col. J. M. Shoonmaker, one of the heaviest operators in the Connellsville region, has purchased 2000 acres of coal land in Colorado, and has erected ovens on it. The coke made is not as good as Connellsville coke, but as it has an advantage of \$15 per ton in freight it is in good demand among the silver smelters. Samuel Mott is prospecting for coal on lands belonging to Peter O. Anderson, on the hog-back northwest of town. There were shipped from Crested Butte during the week ending Aug. 22d, 91 carloads of coke and 222 carloads of coal.

GEORGETOWN MINES.—Courier, Aug. 25: The Mineral Chief is being opened at six places by as many sets of lessees. The openings extend 800 feet along the vein and five of them show mineral. It begins to look as though this discovery is indeed the mineral chief, and will develop the greatest body of ore ever seen in the county. Between 60 and 70 men are employed in the Terrible mine and a dozen levels are being driven ahead. Pending the reorgan-

ization of the company, which has been assuming ahead for a year past, the management is not desirous of leasing ground, hence the diminished number of men employed. The new company will be called the Colorado Silver Mining Company, limited, of London, England. The lessees on the Coin have broken into a four-inch vein of way-up ore. They were working last month on a low-grade ore. The Cowles brothers have struck what appears to be a good vein of silver on Lincoln Mt.; surface material runs 600 ozs per ton. A vein of solid ore more than 12 inches in thickness has just been struck in the Peruvian lode, the other side of Argentine Pass.

DAKOTA.

DEADWOOD DISTRICT.—Pioneer, Aug. 21: Fires were started in the Hartsfeld smelter at three o'clock yesterday afternoon. It was not intended to begin running through ore until eight or nine in the evening. Reports therefrom may be looked for to-day, and it is hoped they will prove as satisfactory as parties interested desire. The ore recently shipped by the Seabury-Calkins averaged \$150 per ton. Work goes on steadily, and more rock of like quality is being extracted every day. Coke for the Hartsfeld smelter did not reach Galena Thursday as was formerly announced, but was received about two o'clock yesterday afternoon. It was talked last night that a party of three or four mining men of large means will arrive to-day, to look over property at Bald mountain and Ruby basin, with a view to purchasing. The Cora has made several shipments of ore to Omaha recently, and proposes sending forward another carload the coming week. Lynn, Sebastian & Delaney are about sending a carload of ore from the Ontario, Galena, to the Omaha Smelter Works. Pay ore has been struck on the Hard-scrabble ground, situated near the Tornado group, Bald mountain. A telephone from Galena to John Baker last evening stated that yesterday's run of the Merritt smelter was decidedly the most satisfactory to date. More ore had been run through, and more bullion turned out than for any one preceding shift. Two hundred and fifty ore sacks were received at the Northwestern office yesterday. They will be used by a Bald mountain company which proposes beginning extensive shipments to Omaha.

ON THE "SPANISH R."—Operations at present are principally on the 170 level, where a large body of carbonate ore is disclosed. In the future, shipments in carload lots will be regularly made to Kansas City at intervals of five or six days. The ore runs average between \$50 and \$60 per ton, and enough is in sight to warrant that the mine will continue to be operated profitably for a long time to come. The Horseshoe Comet has about completed the cut-off tunnel, and will resume ore shipments before the close of the month. Five mining corporations are pushing developments at Carbonate. They are Iron Hill, Seabury-Calkins, Spanish R., Adelphi—under lease—and Hartshorn.

IDAHO.

SEVEN DEVILS.—Recorder, Aug. 21: All the experts who have visited the Seven Devils district agree in the assertion that it is the largest and richest copper camp in the world. A rumor is current that a rich strike of high-grade ore has been made in the Kentucky mine at Shoup, specimens being taken out richer than any heretofore seen. Free gold in solid nuggets as large as peas were found in this body. Placer mining in the various gulches has been more prosperous than anticipated in the spring. What was lacking from the light fall of snow last winter has been made up by the frequent showers during the summer. Most of the placer mines are cleaning up for the season. The Red Warrior gulch difficulty has been settled. J. M. Patterson has been reinstated as superintendent and H. N. Thomas appointed foreman. The building of the mill is progressing. Popham Bros. have recently discovered a ledge in the Boyle mountain region which carries about two inches of very good looking lead ore—carbonates and sulphate. Mr. Popham says they have sunk 100 feet on the vein and taken out three or four sacks of good ore; ore that will assay from 100 to 150 ounces silver and 50 per cent lead. The prospect seems to improve with depth and may turn out to be another good property on that mountain. The discoverers are very conservative in the estimate of the ledge, and justly so, for, as Mr. Popham says, "it never pays to lie about a prospect." The Relief force of 14 men was laid off this morning. Unable to see H. E. Miller on the subject, a reporter learned from good source that the shut-down is to allow of an estimate of the ore taken from the Relief ground by the Minnie Moore. It is said a compromise in a certain prominent mining man's estimate is likely to occur as a result of damages, and to allow of an accurate survey it was thought best to close the Relief until his arrival. This explanation indicates that the work will soon be resumed.

THE ORO FINO.—Statesman, Aug. 28: As work progresses on this mine the confidence in it is being strengthened, by reason of good ore being found in the drifts now being run on it. The mine is being put in the very best condition for the extraction of ore, an immense quantity of which is already in sight, and which will be taken down by the time the new Oro Fino mill is ready to start up. The more development work is done the better the mine looks. The tunnel in the Sinker ledge is being pushed as rapidly as possible and is now in over 400 feet with good ore in the vein.

THE SILVER KING, OF IDAHO.—Since our last report on this mine, carload No. 6, 37,933 pounds, and carload No. 7, 24,084 pounds, have been marketed, realizing \$4406.29 and \$2445.73, respectively. Lot No. 8 is now being delivered at the Ketchum Sampling Works. It will be a 15-ton car, and on the average of former shipments will realize over \$3000, and make the total value of ore marketed in the past two months from this mine upward of \$26,000 for about 110 tons, an average net value per ton of nearly \$250, after payment of railroad freight and treatment charges. The ore as shipped averages over 300 ounces silver per ton. From parties who have visited this mine recently we learn that the showing is something wonderful, the development of a great ore-chute continuing right along, presenting one of the most perfect mining formations and a demonstrated fact as a big mining proposition. Operations are skillfully conducted with meager and faulty facilities, and every move counts, as it must, to mine, prepare and market from so remote a locality

—lacking reduction works there—and pay heavy royalties, yet realize handsome profits to lessees. Reduction works of most any crude, practical nature would enhance the profits greatly to both owners and lessees, and the latter may be justified in some move to acquire a plant for even their temporary use.

NEW DISTRICT.—A new district has been discovered southeast of Silver City about 15 miles, which promises well. The lodes are large, gold bearing, and are in granite formation. Several locations have been made. The district is called Webster, after the discoverer.

NEXT BOOM.—Wood River Times, Aug. 22: The next big mining boom will be near Salmon City, in Lemhi county, as soon as the Manitoba gets within reaching distance.

BUTTERCUP.—The recent developments in the Buttercup have attracted quite generally the attention of mining men and others interested in the mineral resources of this country. Yesterday a sample of ore from the face of the tunnel, on the ground of the recent strike, was assayed, and it went 833 ounces silver per ton and 77 per cent lead.

SHEEP MOUNTAIN.—Cor. Idaho World, Aug. 16: To give an estimate of the number of men in these parts would be guesswork. The mountains are full of men, prospecting, and all think this will make a lively camp. New locations are made almost every day, some of which are very rich. Some of the old locations are being worked with great interest, and are looking well.

NEW MEXICO.

KINGSTON AND VICINITY.—Shaft, Aug. 23: The outlook of the camp is very encouraging, more so probably than at any time in its history. The new strikes on the Templar, Keystone, Enterpriser and Hornet continue to improve; and besides ore has been found in new places in the Eclipse, Sweepstakes and Savage, while the London and Charm ore bodies are widening and improving. Several new companies with capital to open up and develop mines now lying idle, are being formed. The Enterprise keeps on sinking shafts and extracting ore, the deposit growing richer as the work advances. Samples of extremely rich gold ore are being taken from the Hornet mine. The imports of Mexican lead ore are reported as 7000 tons per month. This does not include shipments which reach this country by water or the immense quantity of lead, which the rulings of the treasury department admit free. A carload of ore from the Black Colt mine netted \$9700 at the smelter. The Silver Bell is getting some good ore, not in large quantities as yet, but very rich. The report that ore was found in the Sciota on the Tierra Blanca was a mistake. The Log Cabin looks better and better every day, and developments show that the ore bodies go down and grow richer. Telluride ore has been discovered on the Enterprise. Thus Kingston shows up to be a mining camp. The Black Colt shipped 18 tons of 200-ounce ore last week.

MONTANA.

FROM VARIOUS MINES.—Review, Aug. 26: Work has been suspended by the Montana Mining and Milling Company. It is believed that they have drifted over the vein. The St. Louis mine, located on the Drum Lummum hill, at Marysville, also is reported as improving with depth. The Gold Leaf and Easter on Towles gulch developed with a tunnel and a new lead is expected to be cut this month. The ore is free-milling gold. The Carbonate, three miles from Marysville, is looking better than ever. The tunnel is being driven ahead as fast as possible, and the pay streak is widening. The ore is galena. A gold-mill is to be erected in the Yoga district, upper Judith country, for working the ores of the Golden Chariot and other gold ledges in that vicinity. A good many such ledges exist in the district and great success is predicted for the mill. Work will be commenced next week on the Allison lode at Marysville. There is a tunnel on this property over 200 feet long, but work will be done in the shaft. The ore vein is three feet wide free-milling gold. Several of the Russell group of mines on Red Mountain will commence operations as soon as the Montana Smelting Company can take care of the output. Then Rimini will be one of the busiest mining camps in Montana. The Drum Lummum mine is now engaged in putting in the largest hoist in Montana, it not in the country. It is located 600 feet under the ground, and is capable of hoisting to a depth of 5000 feet. A large excavation has been made at the 600-foot station for the hoisting plant, which will be walled and arched with solid masonry. It will be placed in position as fast as workmen can be procured to do it. Within the past few days ore of good quality has been struck in the lower tunnel of the Belle mine about 190 feet from the surface. This is a contact vein, between slate and syenite or quartzite, and every indication points toward its becoming a good property. At the Pearl mine the shaft is down some 60 feet below the tunnel level, some of the ore taken out in sinking showing considerable ruby silver. Sinking is now going on at the rate of 2½ feet a day, and the same favorable outlook continues.

ABOUT BUTTE.—Inter-Mountain, Aug. 27: The crosscut at the bottom of the shaft on the Harris & Lloyd is showing up a fine body of ore. The depth is about 320 feet, at which point they were some 30 or 40 feet behind the footwall. The crosscut, after cutting the footwall, went immediately into ore, and at last accounts they had four feet of high-grade copper ore, and about 10 feet of good concentrating ore. Since the above was placed in type it is learned that another strike was made this morning. The ore body next to the footwall was 17 feet thick, five feet being high-grade. Then they cut through a nine-foot dyke of country rock and this morning struck another body of high-grade copper-silver ore, which is supposed to lie on the hanging-wall. At noon they have penetrated it five feet. The purchase of the Kelly & Kohrs interest in the Gambetta, mentioned last week as decided upon by the Boston & Montana Co., was concluded at Deer Lodge through Clark & Larabee's bank. The amount paid was \$20,000 cash. The Combination Co.'s mines at Black Pine are looking well, and in two faces in particular they have a fine showing of ore. Their net profit for last month was about \$7000, and they count upon at least \$5000 per month profit for an indefinite period. The Orphan Girl, Orphan Boy and two or three other properties composing that

group are to be thoroughly explored by the gentlemen who have them under bond. The proposition is to put down a shaft on the Orphan Boy to the depth of 800 feet, and the belief is that an immense mine will be opened. They commenced drifting on the Narrow Gauge some two weeks ago from the lowest point reached by the shaft, 170 feet. They had a narrow seam of ore at the shaft and this has widened to several inches of 800 ounce ore, inclosed on either side by about two feet of ore of a good grade.

MIDDLE FORK.—Livingston Enterprise, Aug. 27: Many items are going the rounds of the press in regard to the Middle Fork or upper Judith country. That whole section of the country, in fact the whole Belt and Little Belt ranges of the mountains, are full of mineral, but that district in particular contains many fine bodies of ore, and one of the largest mining camps in the Territory will some day be located in that section. In speaking of recent work there, an exchange says: The Middle Fork country is yielding some very rich gold ore. In the ground formerly owned by J. D. Weatherax, the tunnel has been driven to a considerable depth, and by making an uprise and sinking a winze a breast of 20 feet of free carbonate ores has been developed that runs from \$4.50 to \$18 a ton. The arastra which has been running on this ore was closed by Mr. Colling, he considering an arastra process entirely too slow for so fine a mine. He made arrangements for a more full development of the mine, assuring the other owners that he would find a way of reducing the rock, once the mine is developed.

OREGON.

CRACKER CREEK AND VICINITY.—Happenings, Aug. 22: The general outlook of the mines of Baker county improves as developments progress. This not only applies to the great Cracker Creek district, but to the districts adjacent, viz.: Cabell Cove, Onion Creek and Greenhorn Mountain, as well. New discoveries are continually being made. The recent sale of a group of mines at Greenhorn to Denver capitalists for the sum of \$100,000 has given quite an impetus to mining in that section. The favorable showing of the La Bellevue mine at Onion creek, owned by J. B. Cabell, gives evidence of the mineral wealth of that section. The placing of a crusher and concentrator on the property within the next 30 days will put this mine in the front rank of ore-producers of the county. At Cracker Creek district everything is a bustle of excitement, occasioned by the extensive work being done on the big mines there and their fine showing. At the Eureka and Excelsior mines 75 or 80 men are employed in and about the mines. At the Columbia a large force is at work. The same at the North Pole, Golconda and others. In fact, work is progressing steadily all along the line from the mouth of Cracker creek for a distance of ten miles. It is probable that one or more mills will be erected at Cracker creek this season. The Oregon Gold Mining Co. contemplates putting a 40-stamp plant costing in the neighborhood of \$100,000. The company has already ordered the mill from the East, and its arrival here may be expected within the next few weeks. The owners of the Columbia also contemplate placing a mill, but whether it will be done this fall or not is not yet known. It is safe to say that by another year three or four mills will be in operation on the mines of Cracker creek.

NEW MINING DISTRICT.—Situated one and one-half miles east of Haines, the first station north of this city, on the O. R. & N. railroad, has been discovered a new mining district that gives promise of great richness in gold and silver. Yesterday afternoon I. B. Miller and J. W. Hall brought a wagon-load of ore to this city from their locations, the Crown Point and Silver Bow. They have made arrangements with the managers of the old quartz-mill to crush the ore. This is the second wagon-load brought by them to this city within the past week, the yield of the first lot being very satisfactory.

UTAH.

ABOUT PARK CITY.—Salt Lake Tribune, Aug. 27: Work on the Ontario three-mile drain tunnel is being pushed vigorously, a large force of hands, soon to be increased, being now employed on the enterprise. The bore is 7 feet 6 inches high in the clear; 5 feet at the top of the sill and 7 at the bottom, and the work is being done in a most thorough manner. It is in over 60 feet, in hard rock, and an average of one foot per shift is driven; but as soon as the power drills are in operation, probably by Oct. 1, much faster progress can be made. Work will soon be resumed on the Whitehead group and in the Deer Valley tunnel. Both of these properties are near the line of the big drain tunnel, and a bright future is before them. Hughes & Bogan are working the first west extension of the Wasatch, and are attaining favorable results. They have encountered ore, a sort of iron speckled with galena. A report comes from a source which ought to be trustworthy to the effect that an amicable settlement of the Grant-Shaughnessy litigation over the Glencoe property is being made. Seventy-five men are employed at the Crescent, and about 150 tons of ore come down over the tramway daily. The big incline shaft which is down 250 feet is nearly free from water by the pumps, and it is thought that sinking will be resumed in a few days. Sundberg & Johnson have been awarded the contract to run a 40-foot drift to the ledge from the 100-foot level in the Himalaya, under Scott Hill. They have cleared up the wreck of last winter's snow-slide and commenced work with a vim. The west drift in the Massachusetts, from the 600-foot station, is already in about 60 feet, and upward of five feet a day are made.

THE LUCKY BILL.—Since the 1st of June 24,000 shares of this company's stock have been sold at 25 cents a share, leaving 16,000 shares yet in the treasury. The stockholders' certificates will not be issued until all of the working stock is disposed of. This speaks well of the estimate of worth placed on the property, particularly because nearly all of the stock has been sold to persons living in town. Burton & Firmstone have taken a contract to run the tunnel 500 feet farther to the northeast, along the course of the ledge. When finished, this will make the length of the tunnel under Flagstaff hill 1150 feet, and it is expected that with such a depth the ore-body will show up big. The Lucky Bill is a good property destined to become one of the new ore-producers of the camp before long. A rich strike is reported in the McCune mine.

ORE CRUSHER

Sectional View of Pulverizer.

PNEUMATIC PULVERIZER.

The principle of pulverization consists in the employment of two

POWERFUL OPPOSING CURRENTS

Of dry super-heated steam, so arranged that they continuously charge themselves with crushed or granulated material, and by the great force and velocity of the steam currents the minerals are dashed against each other with such power of concussion as to cause the hardest ores to be pulverized to any degree of fineness desired. The high temperature of the super-heated steam currents employed, through which every minute particle of ore must pass, causes them to become very hot and dry, which produces a beneficial effect upon Sulphurets and ores containing rusty Gold. The light weight and simplicity of construction of the Pulverizer, the extremely small and inexpensive wearing parts, are the WONDER and SURPRISE of all who witness its operation. The Company is prepared to furnish complete plants for pulverizing

10 TO 200 TONS PER DAY,

Including a Sectional Steam Boiler supplying all the power required.

The BUYERS' GUIDE is
issued March and Sept.,
each year. It is an ency-
clopedia of useful infor-
mation for all who pur-
chase the luxuries or the
necessities of life. We
can clothe you and furnish you with
all the necessary and unnecessary
appliances to ride, walk, dance, sleep,
eat, fish, hunt, work, go to church,
or stay at home, and in various sizes,
styles and quantities. Just figure out
what is required to do all these things
COMFORTABLY, and you can make a fair
estimate of the value of the BUYERS'
GUIDE, which will be sent upon
receipt of 10 cents to pay postage,
MONTGOMERY WARD & CO.,
111-114 Michigan Avenue, Chicago, Ill.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and
high heads are utilized, and are guaranteed to give more power with less water than
any other wheel made. Being placed on horizontal shaft, the power is transmitted
direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in
capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the
ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost,
by applying to the manufacturers.

Birth and Death of a California Stream.

EDITORS PRESS:—Four years ago, near the summit of the Sierra, was a mountain valley. Beneath its pines in the early spring lay the cloak of snow that, slowly melting, trickled tributary to a central stream. This silver thread among the green now rushed roaring over the fall, now hurried among the pebbles, now idled in the glassy pool, now sulked in eddies, but still pushed on and on to the diatant and thirsty plain. Like the youth who leaves his home and loving parents, his relatives and friends, all for the glittering and grasping world, so this stream left the singing pines, the faithful spruce, the friendly alder, and abandoned the fragrant cedar and the bay for the gold and gain of toil.

It speeds to the plain, some to the permanent grasses of the pasture, some to springs and wells in the grain lands, and some to the field of the husbandman. Let us follow this offshoot in the furrow through a dark green grove of oranges. First it seeps into the ground, then mounts the tree and glistens in the foliage and fruit. How round and bright the orange grows. Soon our stream is boxed, and rattles off in train after train to the noisy marts of men. Now comes a transmutation, and our stream held so sweetly in the rounded orange is turned to gold and travels back again in goods or double-eagles to the worker in the fields.

Some years pass by and we look again into the mountain valley. The lumberman has been there first. The cold steel of his ax has laid low the trees—not a patriarch was spared. Next came the herder. He finds the dead tree-tops tangled in the brush and his sheep impeded. To clear a way he sets his fires. The breeze that so little while ago was whispering sweetly with the forest leaves, inconstant, now fans the flame that burns their ruins. Not only this, but it hurls the young saplings and the sheltering shrubs, aye, even the seeds of the forest are consumed. Thus, with the power of reproduction gone, the forest family tree is cut off root and branch.

What a cruel change of prospect is there now. The valley erst so green and shady, with its trees and flowers and banks of snow, is now bleak and dark. We now look sadly on the splintered stumps of our old tree friends, blackened with the fire-flame. The skeletons of the bushes are stretching out their charred remains as though calling still to heaven for help, and nothing meets the eye but desolation. There is no snow now, and our noisy brawler, the brook, has quite disappeared. The silver line is there, but instead of green it is lined with mourning black; instead of water it is now broader of sand, gravel and rock.

A little way down was a bee-ranch. The stands and house were saved, but the flowers of the chaparral and of the trees are gone. The bees, without food, are dead, and the place is deserted. Down in the plain some of the fields are covered with sand and gravel. The county tax is higher because bridges washed away must be rebuilt; railroad travel was interrupted and the irrigating ditches are dry. The stream that ran clear to fertilize for the farmer and to rejoice the rambling angler is no more. During the snows and rains, however, there is a turbulent torrent and a most truculent traveler who will stay in no given course, and whose baggage of sand and stones is dumped in the fields and orchards. From the mountain it descends to destroy, and floods without fertilizing.

So the world's history is being repeated in California. The mountains are being burned and bared, their water-holding power is being destroyed with the forests, and the plains and valleys just springing into fertility are threatened by the torrent on the one hand, and by the demon of drouth on the other.

The forest of the mountain gives fruit to the plain. The forest is the friend of the farmer, but the farmer will not put out his hand to help this friend now sore pressed on every side.

The lesson has been learned in other lands by bitter experience. It seems that this is the only way that we can learn the lesson in America.

Santa Monica.

Mining Share Market.

It remains "stale, flat and" to some of the insiders not "unprofitable," and this because they possess the art of extracting "blood from a turnip." Then somebody seems to be quietly gathering in certain stocks, but for what purpose only those in the secret can tell, and this adds occasionally a little more life to the market. The "chippers-in," too, with their noise and affectation of business, do a little in the same direction, and so the industry is kept on its legs, with a show of something being done all the while. Quotations for this week remain as before, shares having undergone the customary slight variations without any general advancement. The present would seem to be a good time to buy this class of "securities," it being perhaps equally as good a time to sell.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports: Ontario, Aug. 22, 16,905 ounces; Daly, 23, 10,589 ounces.

Mines and Mining in the Okanagan County.

EDITORS PRESS:—The Salmon River district and city are situated in Okanagan county, Washington Territory, being distant from Spokane Falls 160 miles. The first mineral discoveries in this vicinity were made in May, 1886, on the Salmon river, a tributary of the Okanagan. In September of that year additional discoveries were made at two points four miles farther south, these being now known as Salmon City and Ruby City.

The ores in the Salmon district consist mostly of galena and gray copper, with also some of the chloride and sulphuret varieties. They are mostly high grade, and with the exception of the chloride can be readily concentrated. The concentrates run from \$200 to \$2000 per ton. The principal claims here are the La Euna, Columbia, Homestake, Tough Nut, Hidden Treasure, Pointer, Lone Star, Lady of the Lake, Eureka, Washington, Ida May and Wellington. The principal claims at Ruby are the Colville, Black Hills, Blue Bird, Peacock, Gray Wing, War Eagle, Idaho, Poorman, Fairview, Cleopatra, First Thought, Delta, Bay Horse, Monitor, Arlington, Pomeroy, Hula, Arizona, Bockeye, Ruby, California, May and Spokane.

These being sulphuret ores, easily concentrated and rich in silver, effectually solves the transportation problem, as the concentrates are rich enough to bear carriage to even the most distant points. These will shortly rank among the most important mining camps in the Northwest.

The Okanagan is a beautiful region abounding in grazing lands, lakes and forests, and a more picturesque mining district or a more agreeable climate it would be hard to find.

This is a pleasant climate, not extremely warm in summer nor cold in winter. Though pretty well north and the altitude between 3000 and 4000 feet, the winter temperature is modified by the "Chinook," the warm wind which during that season often comes in from the ocean.

The Oregon Navigation Company has put a steamboat on the Upper Columbia running above Priests' rapids. It made its first trip only a few days since. As this brings water transportation within 20 miles of this place, it will greatly reduce the price of freights, heretofore rather high.

T. YOUNGER.
Salmon, Okanagan Co., Washington Ter., July 21, 1888.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in Dewey & Co.'s Patent Office Library, 220 Market St., S. F.

FOR WEEK ENDING AUG. 21, 1888.

- 388,252.—HYDRAULIC DREDGING APPARATUS—A. B. Bowers, S. F.
388,253.—DREDGING MACHINE—A. B. Bowers, S. F.
388,337.—DREDGING APPARATUS—A. B. Bowers, S. F.
388,177.—AUTOMATIC GAS-LIGHTING AND EXTINGUISHING DEVICE—R. F. Bridwell, S. F.
388,180.—CAR-HEATER—Carter & Pickett, Canyonville, Ogn.
388,371.—STATION INDICATOR—T. W. Munroe, S. F.
388,231.—CAR-COUPLING—J. P. Turney, Ailing-ton, Ogn.
15,800.—TRADE-MARK—D. McC. Gedge, S. F.
NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

AUTOMATIC GAS LIGHTING AND EXTINGUISHING DEVICE.—Richard F. Bridwell, S. F., assignor by direct and mesne assignments of two-thirds to Henry H. Allen and Mary Pendergast of same place. No. 388,177. Dated Aug. 21, 1888. This device consists of a clock-work mechanism, which causes the revolution of two cams. One of these operates a lever, which, through proper connections, turns a valve and admits gas to the burner. At the same time it operates another lever, which, through suitable mechanism, draws an electric sparking lever back to position, so that when the cam relieves the main lever, the sparking lever is thrown by its spring past the burner, and its electric contact thereby emitting a spark and lighting the gas. The other cam in its turn operates the first lever to turn the valve back, and thus cut off the flow of gas to the burner. Provision is also made for running the lamps on the moonlight schedule by rendering the mechanism inoperative at any given period.

A NUMBER of capitalists have taken the initiatory steps for incorporating a company for the purpose of utilizing the water-power of the Truckee river for operating stamp-mills and mining machinery on the Comstock, the power to be transmitted from dynamos operated by that stream to the lode on copper wire.

MINING SHAREHOLDERS' DIRECTORY.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, term of subscription, and give it their own patronage, and as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

The inhabitants of San Ramon valley, Contra Costa county, are considerably elated over a gas well which was struck a few days ago within 100 yards of the schoolhouse in the town of San Ramon, and near the center of the valley. The Stone boys were boring a well to supply the school with water, when at a depth of 35 feet they struck a strong flow of natural gas, and upon a torch being applied to the hole at the surface of the ground the gas caught fire and burned at a furious rate for a few minutes, the flames mounting up several feet and then following down into the hole until the moisture extinguished the flames.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge, by sending us assisting agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

G. W. INGALLS—Arizona Territory.
A. F. JEWETT—Tulare Co.
C. E. WILLIAMS—Yuba and Sutter Co.'s.
JOHN L. DOYLE—Oregon, Montana and Idaho.
W. W. THOMAS—Sonoma, Napa and Yolo Co.'s.
F. B. LOAN—Nevada State.
S. J. LITTLEFIELD—Santa Barbara, Los Angeles and San Diego Co.'s.

Don't Fail to Write.

Should the paper be received by any subscriber who does not wish it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

Easy Binder.

Dewey's patent elastic binder, for periodicals, music and other printed sheets, is the handiest, best and cheapest of all economical and practical file holders. Newspapers are quickly placed in it and held neatly, as in a cloth-bound book. It is durable and so simple a child can use it. Price, size of Mining and Scientific Press, Rural Press, Watchman, Fraternal Record, Masonic Record, Harper's Weekly, and Scientific American, 70 cents; postage, 10 cents. Send for subscribers of this paper, 50 cents. Send for illustrated circular. Agents wanted.

IRON—No. 1, \$22.00.
LEAD—\$4.32 1/2.
TIN—\$21.00.

The following is the latest by mail from the "New York Metal Exchange Market Report":

COPPER—Steady, spot closing at \$16.70 @ 16.80. Transferable Notices (Lakes) issued at \$16.50 @ 16.60.

Please Remit.

Too large a number of our subscribers are in arrears on this paper. Now that we have been a little overkind to such, there is the stronger reason that they should make an extra effort to remit the amount due us for subscription without further delay. We have been very earnest and sincere in presenting a paper to each and every one of our subscribers well worth the price asked for it when paid in advance, and in justice to ourselves we must now insist upon all subscribers in arrears paying up. While to each individual the amount is small, collectively it is large to us, and we are obliged to urge settlement.

Sampling Works for Sale.

The works are situated on A. & P. R. R., Calico Mining District, Daggett, Cal., and contain a first-class Engine and Boiler with Ore Crusher and other machinery, Platform Scales, Mill Scales, Assaying Outfit, etc., all nearly new. Also upon the premises an office building and a comfortable dwelling house (portable). The above can be had at a bargain. Apply to GILLESPIE & CHILDS, 123 California street, San Francisco.

J. A. JOHNSON, 307 Montgomery street (the Nevada Bank building) is the general agent of the Stiles quartz machinery, and offers easy terms for introduction.

BOUND VOLUMES.—Back files of this paper bound in substantial cloth binding with leather back, containing six months' numbers in each, indexed, can be had at this office at \$4 per volume.

Books on Working Ores.

By GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1880.

This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, \$3, coin, postage free. Sold by DEWEY & Co., Publishers, 252 Market St., San Francisco, Cal.

By C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, \$3. Sold by DEWEY & Co., S. F.

DEWEY & CO.'S

Scientific Press

Patent Agency.

ESTABLISHED 1863.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us offer to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St. S. F.

THE RAND DRILL COMPANY,
23 Park Place, New York.

We are now so situated with our new works as to offer to the miners of the Pacific Coast SMALL AIR-COMPRESSING PLANTS at such prices that almost any small mine can afford to put in power drills if they have none in use.

By our NEW AND PATENTED SYSTEMS (by which the duty or performance of drills is not reduced with use) it is no longer necessary PLANTS IN THIS COUNTRY, and has patterns for all sizes up to 40-inch diameter of cylinder.

In respect to capacity IN SPEED OF DRILLING, perhaps it is in order to say that in EVERY AUTHENTICATIVE CONTEST for speed yet initiated, the RAND DRILLS have, without exception, BEEN VICTORIOUS. This fact, coupled with another important one, that the drills use much LESS AIR and cause LESS REPAIRS, has won for them nearly all of the Eastern mining trade, which has kept their works always busy.

Since the reasons which formerly restrained us from the California market no longer exist, we are now in the field for the business.

SPECIAL ATTENTION is called to the latest designed sectional Compressor just built for the Batopilas mine in Mexico, and to the Compound Engine Compressor built for the Anaconda mine in Montana.

\$1,000 CHALLENGE ACCEPTED, PRICE, FIVE HUNDRED AND FIFTY DOLLARS (\$550.00).

**THE
"TRIUMPH" ORE CONCENTRATOR.**

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

Comparing our plates with those of other manufacturers, after repeated tests, we can safely guarantee much better plates for the same money. Our plates are used by all the prominent mining men on the Pacific Coast. SEND FOR CIRCULAR.

THE DOUBLE "ECONOMIC" STAMP MILL.

We have here the Stamp Mill in a cheap and simple form. The high drop of the old stamp is more than compensated for by the great weight (1200 lbs. each) of our stamps, and the rapidity (300 strokes each per minute) with which they run. There are 4 shoes in each stamp, so that there are 4800 strokes of the shoes on the dies per minute. Less power is required than in any other mill to do the same amount of work.

The Mortar has screens at both ends, giving ample discharge. There are no cams or tappets to wear or be adjusted. The stamps adjust themselves as the shoes wear.

AN AUTOMATIC ORE FEEDER Rock Breaker.

Goes with each Mill. We also have a suitable

Several Mills are now in the mines doing excellent work. The "Economic" is not only a mill for small mines, but we believe it is destined to supersede the old stamp in mills of the largest capacity.

TATUM & BOWEN,
34 and 36 FREMONT STREET, SAN FRANCISCO, CAL.
Manufacturers of Mining and Sawmill Machinery, Engines, Boilers, Etc.

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; is in successful operation and we guarantee its work as represented.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

"Westward the Star of Empire Takes its Way,"

That is to say, it did so until having reached this Pacific Shore; it has here been arrested. Forty years ago, guided by that auspicious "Star," there was pouring into this California such an immigration as had not before occurred in the history of our planet, whether reference be had to the magnitude of the movement or the consequences that grew out of it. And yet, how different the character of the people now arriving in this State and how different the motives that have prompted them to come here. The men who so poured into California these four decades ago, came as mere adventurers—came not to stay but simply for the purpose of securing a portion of her then only known form of wealth and hastening away.

Not intending to abide in California, these Argonauts were indifferent of her good name, and careless of her interests, as why should they not have been, considering the low estimation in which the country was held of all mankind. What to them could be the future of a land so embosomed with mountains, so scarred with deserts, and largely covered with arid plains?—a land occupied by wild Indians, ease-loving Spaniards, and half-breed whites. There could be but little here to attract or to satisfy the American, accustomed to different scenes and a different civilization, their hearts being all the while in their old homes. Not at all strange then that the pioneers on these shores should have betaken themselves to the business that brought them here, pursuing it with an eagerness and an energy that permitted little else to interfere with its successful prosecution.

That there were among these early adventurers many rough men may be conceded, for theirs was a rough life and rough calling. Nevertheless, they did their work well and in many things even planned well for those who were to come after them. They founded liberal institutions, adopted a broad public policy and preserved the soil of California to freedom, besides constructing many improvements of a highly useful and costly kind.

Not only so, but the "star of empire" having panned in its westward movement, they turned the tide of "empire" backward. Restless and enterprising, these brave and hardy men directing their footsteps toward the East, went forth and peopled the wild regions lying off that

way, and thus California became a founder of colonies even in her youth. She can point to her colonies if not to her colonial possessions planted far beyond her own borders. And so has the settlement of the great interior been hastened by an emigration from the west.

According thus much of praise to these pioneers, let us see what of superior merit can be claimed for this latter-day immigration, the members of which come not here to plunder California and then leave with their gettings, but to make here their homes and enrich her by

An Improved Mining Hoist.

We give on this page an engraving of a standard type of hoisting engines designed and manufactured in this city by Hinckley, Spiers & Hayes of the Fulton Iron Works. The hoist has double cylinders, double reels, and operates with single-tooth gears, and is adapted for deep mining. These engines are 12x16. A special feature is their simplicity of construction and their strength. The working parts are on top so that they are easy to get at in case repairs

Work at the Mining Bureau.

As remarked by us last week, the State Mining Bureau is just now the scene of much activity and hard work. As the institution expands the labor of the superintendent and his assistants necessarily grows space. But the present is with the Bureau an especially busy season. Secretary Durden, what with his duties of cashier and curator of the museum and mineralogical collection, has his hands full, doing, as he always has done, the work of two

men. Not only so, but there has lately been superimposed on these the further duty of classifying and putting in place on the new gallery prepared for their reception the mineral specimens, curiosities, etc., that have accumulated to a perplexing extent.

Prof. Snyder, the assistant mineralogist, is also kept busy examining the ores, fossils and other products of the mineral kingdom submitted to him for determination. In associating with him for this purpose one so capable and experienced, Mr. Ireland has shown unmistakable good judgment. It is said that his assistant in referring a mineral has never, during many years of practice, been found in error.

Then, too, the resident trustees, one and all, are giving to the interests and affairs of the Bureau much personal attention.

The regular meetings are fully attended, and no day passes but some of these officials are present counseling or otherwise aiding those having more immediate charge of the institution.

But it is on Superintendent Ireland himself that the burden of the labor as well as the responsibility falls. His duties, always manifold and onerous, are just now greatly increased by the large amount of preliminary work involved in the preparation of his annual report, a document likely to be much more voluminous than any of its predecessors. For some weeks past the manuscript notes collected by his numerous assistants in the field have been coming in at a rate that would have appalled a less resolute and industrious worker. Of this manuscript there will be a thousand pages or more, all of which will require to be examined and revised before being sent to the public printer. On this pleasant work Mr. Ireland is now engaged.

That he will succeed in putting these data so industriously collected and generally reliable in proper shape, producing finally a report alike creditable to himself and useful to the public, we verily believe.

IMPROVED MINING HOIST MANUFACTURED BY THE FULTON IRON WORKS.

contributions of their wealth and labor. That they contrast favorably with the Argonauts, at least in this particular, cannot be denied. That they will in most other respects make equally good citizens is highly probable. The most of these new-comers are people of means, are well educated and largely American by birth, possessing also other qualifications calculated to render them a valuable acquisition to the population of the State. Appreciating their many virtues and the much that has been accomplished by the pioneers, we welcome these later arrivals as a desirable addition to those who came before.

An Eastern mining company has just completed a new 10 stamp mill at Old Oreana, on the Humboldt river. The company's mines are located in Trinity district, about eight miles from the river. The ore carries gold and silver and is free from base metals.

A WIDE RANGE.—At Fort Benton, Montana, the records of the signal service show a range of 170 degrees in one year. Two years ago last summer, it was 110 degrees, and the following winter 60 degrees below,

may be necessary. One of these hoists is now in use at the Ilex mine, in Calaveras county, and another at the New London mine, Amador county. This hoisting plant is provided with indicators, etc.

MINING ACCIDENTS.—On the 30th ult. John Henager while drilling in the Palouse country lost an eye by a piece of steel from the drill flying off and striking it. August 23d John Oberton had his arm broken and badly cut and his right hand mashed to a pulp by a rock falling on it in the Union mine at Copperopolis, California. On the 27th ult. James McKinnon and John Murphy were caved on in the Alta mine, near Gold Hill, Nevada, and sustained very severe injuries.

THE experiments made by the Union Electric Co. at Lykens coal mine, Pennsylvania, have proved a success beyond all doubt. The loaded and empty coal-cars in the mines are now propelled by electric motor instead of the old-time mule or steam locomotive.

A KILN of 300,000 brick has been fired at Tuscarora, Nevada.

The Russell Process.

Its Practical Application and Economic Results.

(Continued from our last.)

2. *Reasons for Adding all the Hyposulphite to the Extra Instead of the Ordinary Solution.*—The first reason is that, in treating raw ores, the extra solution is nearly always used first. As it is not preceded by any wash-water, but is used on dry ore, no loss of chemicals occurs at this part of the leaching.

Secondly, in treating "simple alkaline" roasted ore, the extraction of a large part of the silver must be done by hyposulphite of soda or lime in the presence of cuprous hyposulphite. But when bluestone is added to a hyposulphite solution, it absorbs twice its weight of hyposulphite of soda or lime into the cuprous hyposulphite. So, if only that amount of hyposulphite were present, it would all be absorbed in this way, and the extra solution would fail in this, the most important of its two uses, on simple alkaline ore. The work of the extra, in the use of it here recommended, is more quickly done and at less expense of bluestone, in proportion (within certain limits) to the strength of the solution in hyposulphite.

Thirdly, when the metals are precipitated from the extra solution, it becomes converted into ordinary hyposulphite solution, so that the addition of hyposulphite to the extra is, in all cases, eventually the same as adding it to the ordinary.

Fourthly, as the extra solution, at the time of making it, must have twice as much hyposulphite as the bluestone added to it, it is found much more economical to add to this small volume of extra solution sufficient hyposulphite to raise it to the proper strength (say 1.75 per cent) than to maintain the whole volume of stock solution at that strength.

3. *Strength and Preparation of the Extra Solutions Raw, Acid Roasted and for Alkaline Arsenical Roasted Ores.*—The strength of the extra solutions used on the above ores varies from 0.7 to 1.1 per cent in bluestone, and from 1.5 to 2.3 per cent in hyposulphite. This percentage of hyposulphite is the percentage existing in the stock solution at the time of making the extra, plus that added with the bluestone.

The reason why the extra solution for roasted ores can be made up on the charge of ore is that it is prevented from sinking into the charge during its preparation by the solution already in the charge, which stands level with the surface of the ore—the outlet of the leaching-tank being stopped while the extra solution is being prepared. But, in the treatment of raw ores, the extra solution is generally used on dry ore, which would absorb the extra solution during the preparation of it, and thus prevent the obtaining of a homogeneous solution.

4. *Strength and Preparation of the Extra Solution for Simple Alkaline Roasted Ore.*—No rule can be laid down for the preparation of these extra solutions, as the volume required may vary from four to six times the amount required to saturate, and the strength from 0.1 to 0.33 per cent in bluestone. Besides, for some ores of this class, all or a portion of the bluestone may be used, as at Lake Valley, in the first wash-water.

5. *Amount of Chemicals Required, and Efficiency of the Extra Solution in the Extraction of Silver.*—Table XVIII gives the amount of chemicals required for strong, medium and weak extra solutions, the amount of hyposulphite given in the table varying not only as the amount of bluestone used, but also as the strength of the stock solution. The table is for Cusi roasted ore, which has an acid reaction, weighs about 70 lbs. per cubic foot, requires 11 to 12 cubic feet to saturate it, and is treated in charges of about 9 tons. Of course an ore, requiring only 7 to 10 cubic feet to saturate it, would require less chemicals for the various strengths of stock solution.

A noticeable fact is the difference in amount of bluestone and hyposulphite required in the treatment of simple alkaline roasted ore, as compared with acid-roasted ore. In Table XIV, the six acid roasted ores require an average of 6.1 lbs. bluestone and 4.9 lbs. hyposulphite, while the four simple alkaline ores (Sierra Grande, San Miguel, Veta Grande and Daly) require only 4.5 lbs. of bluestone and 2.9 lbs. of hyposulphite.

The average maximum extracting-power in silver per ton of ore of a single medium or strong extra solution in Table XVIII, containing 6½ to 8 lbs. of bluestone per ton of ore, is 12.2 oz. per ton. This was determined in 21 experiments at Cusi on San Antonio and San Bartolo ore. For these tests charges were selected, having tailings of 20 to 40 ozs. per ton after the ordinary solution had done its utmost work and had failed to lower the value of the tailings further. The extra solution was then used on these charges—sometimes the strong and sometimes the medium of those described in Table XVIII. Of course, on charges yielding tailings of 30 to 40 ozs. per ton by the ordinary solution several extra solutions had to be used to reduce these tailings to 6 or 8 ozs. per ton. The results showed that the use of 6½ to 8 lbs. bluestone per ton increased the average mill-extraction by 12.2 ozs. per ton of ore, which is equivalent to 1.68 trounce ounces of silver for each avoirdupois pound of bluestone. At the Ontario, the additional extraction caused by the use of two charges of extra solution of 9½ lbs. each was an extraction of 39.1 per cent of 88-ounce ore, more than could be

extracted by the ordinary solution in either the mill or the assay-office. This is an additional extraction of 34.4 ounces per ton or 17.2 ounces for each extra solution with 9½ pounds bluestone, or an extraction of 1.81 ounces of silver per pound of bluestone. Both the Cusi and Ontario were acid-roasted ores.

TABLE XVIII.

TABLE OF CHEMICALS REQUIRED FOR EXTRA SOLUTIONS OF VARIOUS STRENGTHS FOR CUSI ROASTED ORE; WEIGHTS OF CHEMICALS PER TON AND PER CHARGE OF NINETEENS.

Strength of Extra Solution (per cent)	Bluestone per charge (lbs.)	Hypoculphite per charge (lbs.)	For a Stock Solution Containing 10 of One Per Cent Hypo. 3.0	33.0	45.0	30	30	30	30

Only for a roasted ore which requires 12 cubic feet to saturate.
For cost of these various extra solutions see Table XXIV.

At the Ontario, when allowed to act on tailings from the ordinary solution, but very high in value, or in other words when allowed to show its utmost efficiency, the amount of silver extracted by the extra solution was in value about 15 times its entire cost, including chemicals, preparation and application, and the precipitation of the metals from it. When used on simple alkaline roasted ore, the extra solution may have a still greater efficiency in extracting silver, due to its double action hereafter referred to.

6. *General Rules to be Observed in the Preparation and Use of the Extra Solution.*—If the extra solution is made at a temperature of over 120°, it should not be prepared until just before using. Even cold extra solutions should not be allowed to sit and unused more than six or seven hours. For all ores except the simple alkaline roasted ores, the total weight of hyposulphite used, including that existing in the stock solution, should be at least twice the weight of bluestone. For simple alkaline roasted ore, the weight of hyposulphite used, including that existing in the stock solution, should be at least three times that of the bluestone.

As already stated, the extra solution is made up either in a separate tank or on the surface of the charge. The first method is always used for raw ores, and for roasted ores also if the leaching works are to be run to their utmost capacity. In this method about one-third of the total volume of solution required for the extra solution is run into the storage-tank in which the extra is to be prepared. The proper quantity of chemicals is then placed in the chemical box, and the remaining two-thirds of the stock solution allowed to run in through this box. If this is not sufficient to dissolve all the chemicals, some of the extra solution in the tank is circulated through the box by means of a No. 4 siphon pump until they are dissolved. The reason for running one-third of the stock solution into the tank before dissolving the chemicals is to avoid the formation of the yellow precipitate (cuprous hyposulphite) at the bottom of the tank, which would be dissolved only after considerable stirring. In any case, however, the extra solution is stirred just before it is used. In making up the extra solution on the surface of the ore, for all except simple alkaline ores, the chemicals are placed in the chemical box and the whole volume of stock solution required allowed to pass through them. The extra solution is stirred just before it is used, and whatever yellow precipitate may be left on the ore will be dissolved during the circulation. But in making up the extra solution for simple alkaline ores, none of this precipitate forms, since it does not appear if, as in the treatment of them, the amount of bluestone is considerably less than one-half the amount of hyposulphite. In making up the extra solution for these ores, the manipulation is the same, except that four to six extras are made up, each containing much less chemicals, which are not circulated, and which are applied directly after the first wash-water, instead of after the ordinary or stock solution, and cold instead of warm. Practical experience has demonstrated that if roasted ores containing an appreciable percentage of caustic lime are treated with ordinary solutions after the first wash-water, as must be done if the old process of leaching is used, the result may be very disastrous, and that the damage done

is only partially made good by the subsequent leaching with the extra solution. But if the extra solution is applied at once, the cuprous hyposulphite neutralizes and counteracts the deleterious effect of the caustic lime, and leaves the silver in a soluble form. Before the extra solution follows the first wash-water, it has been found beneficial to impregnate the ore with a small quantity of a strong copper sulphate solution. It can easily be seen that the first portion of the extra solution, replacing the wash-water, must become more or less diluted by contact with water. This dilution may be so considerable that an insufficient quantity of copper is present to protect the silver from the deleterious influence of the caustic lime. Therefore, after the leaching with water is finished, and just before the extra solution is to be used, about one or two pounds of bluestone per ton of ore is dissolved in an amount of water equal to from one to three inches on the surface of the ore. As soon as this sinks to the surface of the ore, the extra solution is used. But for some ores all the bluestone may be used in the first wash-water. This may be done when the ore contains such a compound (usually carbonate of an alkali or alkali earth) as will precipitate all or a portion of the copper out of the wash-water, in the ore, in such a state that it will be wholly or partially dissolved by the ordinary or stock solution afterward used, thus making the extra solution in the ore. The bluestone, when thus used, is added to about one charge (or volume to saturate) of wash-water, which may be either passed through the charge only once or circulated. If desirable, it may be followed by more wash-water, in order to wash out any copper not precipitated in the ore.

c. Differences Between the Solutions.

1. *Difference Between the Ordinary and the Extra Solution and Between the Extra Solutions.*—No extra solutions are kept in stock; they are made up fresh for each charge. The extra solution for simple alkaline ores is used like the ordinary, i. e., without circulating, but differs from it, it containing a fraction of one per cent of cuprous hyposulphite, and in losing its efficiency as an extra when precipitated. For all other ores, both raw and roasted, the extra solution differs from the ordinary in containing from six-tenths of one per cent to 1.2 per cent of cuprous hyposulphite, in being much less in volume, and in being circulated, and also in losing its efficiency as an extra when precipitated.

The extra solutions differ from each other as follows: For simple alkaline roasted ore, the extra is used cold, weak, in comparatively large volume, is not circulated, and is used immediately after the first wash-water; or part or all the bluestone may be used in the first wash-water. For all other ores, both raw and roasted, the extra solution is generally used stronger, warm, as small in volume as possible, after the ordinary solution, is circulated, is followed by hot ordinary, and no bluestone is used in the first wash-water.

2. *Reasons for the above Differences.*—In the treatment of simple alkaline roasted ore, the extra solution has a double use. First, in dissolving and extracting the silver and gold compounds not soluble in the ordinary solution, and, secondly, in protecting the silver (and gold) from the injurious effect of the caustic alkali in the ore, while they are being dissolved by the hyposulphite and are passing out of the charge. The first is the regular use of the extra solution, but in its second use it is of much more value. In this use of the extra, the extraction of that part of the silver soluble in hyposulphite only is done under the protection, so to speak, of the weak extra solution. Hence the bluestone must be used at the beginning, and its use continued until, as shown by experience, three to six charges of solution have been used. Its use is then no longer necessary. It should be remembered that a "charge of solution" is an amount of solution equal to the amount required to saturate the "charge of ore."

3. *Reasons for Circulating and for Small Volume of Extra.*—For those ores on which the extra is circulated, it must be of a certain strength, say 0.6 per cent, to accomplish its object. Therefore, the smaller the volume of extra per ton, the less will be the cost of chemicals per ton. The reasons for circulating the extra but not the ordinary, are two: In the first place, the ordinary solution, in passing through the precipitating-tanks, renews its strength as an ordinary, and is ready to be used again. There is, therefore, no reason why it should be circulated before being precipitated. The extra solution, on the contrary, in passing through the precipitating-tanks, loses its efficiency as an extra, being converted into ordinary solution. Therefore, the whole effect of the extra should be obtained before allowing it to be precipitated, which can only be done by circulating it. In the second place, the volume of the extra is the smallest possible that will saturate the ore, and, on this account, in passing through the charge only once, all particles of the ore might not be brought in contact with it. On the other hand, the volume of the ordinary solution is practically unlimited, the storage-tanks being always kept supplied from the precipitating-tanks at no additional cost for chemicals.

d. *Manipulation of the Extra and Special Extra Solutions.*—When the extra solution is to be circulated, the outlet leading to the precipitating-tanks is stopped when the surface of the extra solution has sunk to one-half inch above the surface of the ore. Steam is then turned into the siphon pump, and the solution returned

on to the surface of the ore continuously from four to six hours. For simple alkaline roasted ore the extra is allowed to pass through the ore as if it were the ordinary.

The extra solution for raw and for acid-roasted ore should be followed by hot ordinary. Also, in the treatment of simple alkaline ores, all the bluestone may sometimes be used in the first wash-water by adding two to four pounds of bluestone per ton of ore to about one-half or two-thirds of a charge of wash-water, after the washing is about finished, and allowing it to pass through the ore like the rest of the wash-water. It may sometimes be followed by more wash-water; but usually it immediately precedes the ordinary. In the treatment of alkaline arsenical ores, ordinary solution is used before the extra, until nearly all the silver has been extracted which is soluble in the ordinary solution. The extra solution is then used, being always allowed to stand from 6 to 12 hours in the charge, although it may then be circulated. It may be used cold or hot, but is always followed by hot ordinary, when used cold. The formation of a yellow precipitate, during the preparation of the extra solution, which fails to dissolve by the time the extra is ready for use, indicates an insufficient amount of hyposulphite.

Acid ores and simple alkaline ores (according to experience so far) should not be mixed in the same charge. In case such a mixture should occur, the charge should be treated first as if it were alkaline ore, and then as if it were acid.

TABLE XIX.

ORDERS IN WHICH THE LEACHING-SOLUTIONS MAY BE APPLIED IN THE TREATMENT OF RAW AND ROASTED ORES.

Order	Strength of Extra Solution (per cent)	Bluestone per charge (lbs.)	Hypoculphite per charge (lbs.)	For a Stock Solution Containing 10 of One Per Cent Hypo.	For a Stock Solution Containing 10 of One Per Cent Hypo.	For a Stock Solution Containing 1 Per Cent Hypo.	For a Stock Solution Containing 12 Per Cent Hypo.

29	2.9	31.9	43.5	29	29	29	29
30	3.0	33.0	45.0	30	30	30	30

The special extra solution is merely an extra solution which has already been used upon one charge. When used upon a second charge, it is always applied immediately before the regular extra. The main object in using it is, that the regular extra solution may be diluted by a solution of its own kind, as it is sure to become diluted to some extent with whatever solution is in the charge. Another reason is, that the efficiency of an extra solution is not usually exhausted by using it on one charge. Its use saves chemicals and causes a higher extraction

of the silver, and, for the same amount of blue-stones per ton, the product is of a higher grade if the extra solution is used as a "special extra."

Also the use of the "special extra" secures a more even extraction of the silver from all parts of the charge of ore. For instance, at Cusi, on San Bartolo ore, the tailings from the lowest six inches of the tub averaged 7.0 ozs. On the other hand, while using the special extra, similar samples averaged 5.3 ozs.

It may be used on any ore, in the treatment of which the extra solution would follow the ordinary. It is not circulated, but precedes the extra as if it were ordinary solution, and passes from the charge on which it has been used directly to the precipitating-tanks.

(To be Continued.)

The Remarkable Colliery in Japan.

Among the many new private enterprises in Japan, the most remarkable is unquestionably the Takashima colliery, which takes its name from the rocky island on which it stands. In its early days, and these are but 20 years ago, it was a petty affair, producing a few hundred tons annually for the use of Japanese salt manufacturers, and occasionally steamers. Now its yearly output is about 500,000 tons—the sales last March amounted to \$50,000—and its vicinity to Nagasaki has the effect of bring-

Englishmen and Petroleum.

Englishmen are at length compelled to acknowledge that they have been mistaken about the petroleum situation and what it presaged. It has taken considerable time to get their eyes open, and the awakening has not been alarming, but it has been astonishing. So secure they felt in the appearances of Russian competition with Pennsylvania refined that the idea of any material advance in the price was regarded as out of the question. They find to be true what the *Derrick* stated several months ago to be probable, that the Russians are not likely to sell oil at 5d. when they can get 6d. for it. They have discovered that Americans can treat the so-called Russian competition with just such consideration as it deserves, irrespective of the magnifying power of the British press. The days of humbug in trade with the United States are fast passing away. This country has outgrown the condition of such people as those with whom England has been accustomed to trade outside of Europe. The means of obtaining full and accurate information concerning the affairs of the world are rapidly approaching their own, and when pitted directly against each other with equal facilities for information, we have yet to learn that American intelligence or ability in trade is inferior to that of any nation. The petroleum situation is becoming stronger from a variety of causes over which America has no control, but

Improved Ten-Inch Four-Sided Molder.

The machine here illustrated is adapted for doing the heaviest as well as the finest grades of work. The frame, cast in one piece, is massive, and as rigid and steady as an inside molder, while it has every convenience for quick changes, all the parts being easily accessible. It has a solid outside bearing for the outer end of top center head shaft.

It has four feed-rolls, six inches diameter, two above and two below; all are geared, the upper and lower being independent of each other. The gearing which drives the lower rolls is not affected by lowering the table to the full capacity of the machine. The feed-works are started and stopped with a binder.

The boxes supporting the main arbor are so arranged that the wear caused by the belt forcing the arbor toward the countershaft is confined to the bottom of the box so that the wear can be readily taken out by tightening the caps.

The bottom and both side beads are adjustable horizontally and vertically. By means of a screw the spindle carrying the outside head can be set at any angle, and the head may then be moved out or in without changing the angle.

The table, which is raised and lowered by an ingenious device, is provided with adjustable chip-breakers on both sides of the bottom head. It also has an adjustable chip-breaker for the inside head. It will dress ten inches wide by

CUTTING GLASS BY ELECTRICITY.—Several of the South Side glass factories are now using electricity for cutting glass. Heretofore when they wanted to cut one of the large cylinders of window-glass, a simple but primitive method was used. This consisted of the pulling out from the furnace of a thin shroud of glass heated white. This was quickly wrapped around the bottle-shaped end of the cylinder, and it burned through or fractured the glass. A pair of tongs had to be used in the process. By the new method the glass cylinder is encircled with a fine wire, the extremities of which are put in connection with a small electric battery. It is necessary that the wire adhere closely to the glass. When a current of electricity is passed through the wire it becomes red-hot and heats the glass beneath it. Then a single drop of water deposited on the heated place will cause a clean breakage of the glass clean around in the path of the wire. Contrary to what takes place with the usual process in the treatment of this fragile material, it is found that the thicker the sides of the cylinder the better the cut.—*Ec.*

ASPHALT PAVING.—A St. Paul gentleman writing from Paris recently says: "My observation of pavements in this city during wet and dry weather confirms me in the belief that, all points considered, asphalt is the kind to be first chosen for all the great driving streets, of course, not for those subjected to heavy business traffic. Paris led in the asphalt innovation on the ground of homogeneity of material, noise-

EXTRA HEAVY IMPROVED TEN-INCH FOUR-SIDED MOLDER

ing to that port a large number of vessels, some to obtain supplies of fuel for themselves, others to carry the mineral thence to Shanghai, Hong-Kong and Singapore. It seems that a certain Mr. Fuka Keikichi, who is treated as the agent of people recently dismissed from the colliery, has been "raving of the mine as though it were an inferno of misers and suffering," and "lamenting over the work people as though among God's creatures none were so wretched and forlorn," and as a consequence the Japan Mail proceeds to give a quiet and comforting, though deeply interesting, account of the great Japanese colliery. But first the writer affords a glimpse of an extraordinary feature of the colliery work at the port of Nagasaki, a few miles distant from the mine. Not less than 5000 women are kept upon the staff of the enterprise, for the purpose of filling the bunkers of vessels there arriving. The method pursued is peculiar to Nagasaki. Lighters carrying the coal come alongside the ship to be supplied, and with each of them is a regiment of women and girls. These form themselves into a loop of a chain, connecting the hold of the lighter with the deck of the steamer. In a moment the hands and arms of this chain begin to move with surprising rapidity and the precision of long practice, and little bags full of coal pass one side of the loop and the same bags descend the other side empty. There is not a second's delay. The business goes on with lightning-like nimbleness, amid the laughter and chatter of the cheerful workers. The results achieved are most remarkable. Under favorable circumstances as to receiving capacity, a vessel can have 400 tons of coal put into her bunkers in an hour, and the neatness of the process is scarcely inferior to its celerity. Such an organization would scarcely be possible outside Japan.

the tide is setting our way. The oil-wells of Gallacia are producing much less oil than formerly, and are believed to be failing entirely. Russian production is not so great as it was. The head has been blown off their territory and the production went largely to waste, the outlay of millions of pounds sterling in the various lands trying to get a truly competitive article with Pennsylvania oil has brought no return to the investment. The Egyptian boom is dead, Burmah is not remunerative. Oriental countries, as well as Europe, have found, despite false brands in imitation of the American product, that Russian oil is inferior to American; that it is watery; that it smokes, cracks chimneys, and the people in those places where cheapness drove out American oil, clamor for the oil they "used to get." The world is fast finding out that mere cheapness in price is not always economy in oil more than in anything else. This is the principal cause for hopefulness in the present situation; the reason why American refiners can look upon Russian competition with what our English cousins see fit to call indifference. The day is dawning when all oil will not be considered to be in competition with Pennsylvania oil more than all flour can be considered to be in competition with wheat-flour. The black, tarry, bituminous stuff elsewhere obtained will be relegated to its proper uses and prices, and may be used on occasion as a substitute, when necessary to prevent extortion, but never as a competitor.—*Derrick.*

SUNFLOWERS are used in Wyoming Territory for fuel. The stalks, when dry, are as hard as maple wood, and make a hot fire, and the seed-heads with the seed in are said to burn better than the best hard coal. An acre of sunflowers will furnish fuel for one stove for a year,

four inches thick on four sides, and the table will lower 12 inches.

Each machine is furnished with five heads and five sets of plain cutters and one extra spur feed; also with necessary wrenches.

The tight and loose pulleys are 12-inch diameter by 7-inch face, and should run 850 revolutions per minute.

ALASKA FUR COMPANY.—Asa Williams of New London, Connecticut, who has been engaged in the shipping industry for many years, and is a member of the Alaskan Fur Seal Co., was the first witness before the House Committee on Merchant Marine and Fisheries. Williams gave a history of the seal fisheries from the time the industry began in the southern seas. As early as 1799, he said, Russia leased the privilege of taking seals. It didn't pay, and this led to ceding the islands of St. Paul and St. George to the United States. After the seal islands cession to the United States, witness said he had a ship fitted out and sent to the seal islands. Four or five other firms did the same thing, and there were taken that year probably over 150,000 skins. The tendency of this was to destroy the industry. Perceiving this was the case, witness came to Washington and urged the enactment of the present law, limiting the number of seals to be taken, setting apart these islands as a seal reservation and letting out the privilege. The stock in the Alaskan Company is held by citizens of the United States. The capital stock of the company is \$200,000. The contract only extends to the two small islands of St. George and St. Paul, and no other part of Alaska. The company, however, carried on operations in other parts of Alaska just the same as other companies were privileged to do,

lessness, perfect surface drainage and the ease with which the streets can be repaired. The asphalt is a charming pavement. The smoothness is exhilarating to the driver. He feels like driving to the portals of the day if he could. There is asphalt and asphalt. Some of it is good; some of it is bad, and there are base imitations of it in crude mineral tar or manufactured tar mixed with pulverized minerals of earth. In all good asphalt pavements the asphaltum rock is heated to 200° or 212°; is compressed while hot and when cool assumes all the essential qualities of the original rock. The Summit-avenue pavement is a fine one. In the city of Berlin asphalt pavements are in high favor. About 500,000 square meters of the pavement are in use there now, and much more is ordered this year at 17 marks 50 pfennigs the square meter—\$4.75. Asphalt is well adapted to the Minnesota climate. The prophete of evil have been disappointed."

QUANTITY OF SALT IMPORTED.—The quantity of salt imported into the United States during the fiscal year ended June 30 1888, was 690,346,246 pounds, worth \$1,156,962 against 778,336,362 pounds, worth \$1,438,031, imported during the preceding fiscal year. The duty paid on the quantity of salt imported last year was about \$8,000,000. This went into the United States Treasury, and relieved the American people of the payment of this sum. If salt were on the free list, as proposed in the Mills bill, it would go into the pockets of the foreign producers.

DEADLY BOMBS IN SCRAP HEAPS.—Seventeen deadly bombs of the anarchist pattern were found in the scrap-iron pile of the Swift Iron & Steel Works, near Cincinnati, where it had been gathered from various sources.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

SUTTER CREEK.—The thermometer has marked over 100 every day the past week. Sinking at the North Star mine is completed, having reached a depth of 650 feet. Drifting has been commenced at the 600 level, running east. In all probability they will not drift far until there will be another drift started west, and both will be run for a considerable distance before they will be abandoned. Everything is going on favorably at the Wildman mine. The first 100 feet sinking will be finished in another week, when they will cut a station and explore the ledge, which from present appearances is very good, and the mill will be likely to run day and night. However, sinking will be continued probably for 200 or 300 feet before they will stop.

PLYMOUTH.—*Ledger*, Sept. 1: The past week has been the dullest week that we have had in Plymouth since the mine closed down, everything seemingly dead and ready to be buried. It will, however, be opened up within a week or less. The very warm weather of the past few days has reduced the water so that there is not more than 25 inches running in the creek, and we hear that water is very low in the river.

Calaveras.

ANGELS CAMP.—*Mountain Echo*, Sept. 1: The new hoisting works of the Ulica mine loom up nearly 100 feet. When completed these will be the highest hoisting works in the State. The Nevills has the deepest shaft in Angels, being over 400 feet. Work in this mine is progressing under favorable circumstances, and the lead in sight is full of gold. The town is full of strangers every day, and business is quite brisk.

El Dorado.

ON THE DIVIDE.—*Georgetown Gazette*, Sept. 1: No part of California has yielded so much gold with so little outlay as the Georgetown divide. Its location in relation to the great Sierras shows that it is in the line of the upheaval which caused them. The Taylor, Rosecrans, Bright Hope, Alpine and other mines are exactly in the trend of the mineral belt, and no doubt received their deposits of ore among the very first of the fissures. The Taylor, Alpine, Josephine, Gopher-Boulder, Dalmatia and Zantgraft are the only vein mines that are worked, and of these all are idle except the Alpine and Taylor. The trouble is not lack of ore, but lack of water to work the stamps and flood the batteries. Of the hundreds of seam mines that are on the divide, many of which are known to be valuable, and some of which are owned by the California Water Company, only the Blue Rock, Beatty and Pacific are working. Of the drift mines, on the north side of the divide, only two—the Buckeye Point and the Cooley—have men at work on them, and they are only developing. The Mount Hope mine, owned by the California Water Co., and lying, according to the opinions of the ablest judges and most experienced miners, exactly in the channel of the old river, is idle. The Fairchild and the Boulder, hydraulic mines, are idle too, although they are known to be rich properties. In every case the trouble is scarcity of water. We have no hesitation in saying that if the supply of water that could be used were at the disposal of the local company, where it is wanted, in less than two years 500 stamps would be dropping, hundreds of seam and drift mines would be at work, every bar on the Middle Fork of the American river would be a hive of industry, good properties like the Bright Hope and O. K. would be developed, prospectors would cover the hills and life, stir and activity would be the order of the day. In the early days the Georgetown divide yielded more than its proportion of the millions California produced. It was all taken from the surface workings, and the wealth they contained was as, to the wealth that lies waiting below, the waves of the ocean to the great mass of water upon which they dance. Once unlocked by means of larger canals, the vast stores of water that lie between the Middle and South Forks of the American river and the Tall's mountain range and the timber belt, and a new and important chapter will have to be added to the history of the gold production of California.

Mariposa.

ABOUT MADERA.—*Mercury*, Sept. 1: The Surprise and Gambetta mines at Grub gulch are turning out rich ore now, from all reports. A new mill is being put up there. New mines spring up daily in the mountains, and the latest is on the summit of the Sierras, about 100 miles east of Fresno, where a New York syndicate has invested \$100,000 recently.

Nevada.

GOOD ORE.—*San Juan Times*, Sept. 1: The Nevada Junction company at Nevada City has tested 200 pounds of the rock from its ledge. Oscar Maltman worked 100 pounds of it and J. J. Ott the remainder. Mr. Maltman obtained from his test \$70.80 in gold and silver, and Mr. Ott figured up \$66.80 as his returns. Judging from results obtained from the 200 pounds, the Junction ore contains 300 pounds of copper to the ton. At the ruling price of this metal, an additional \$66 per ton is to be added to the above figures in determining what the rock will yield when worked for its principal metals. Of course the above figures are reckoned on a too basis.

THE PITTSBURG MINE.—Work has been pushed here with great vigor of late, and the mine shows much improvement. Considerable new ground has been opened up by drifts, and as opportunity offered the working force has been increased until there are now 30 men employed above and below ground, and this force will be increased as sufficient ground is opened to work more men. The mine is now opened to the ninth level, which is nearly 1000 feet on the incline, where a fine looking ledge is exposed, from two to two and one-half feet in size, highly sulphureted, and prospects well in free gold. The company contemplates the building of a new 10-stamp mill to take the place of the old mill, which will have all the latest and best improvements for gold and sulphuret saving, and which will be completed by the first of the new year. Water-power, under pressure, will be used for driving the mill as is now being done for hoisting and pumping. There is an ample water-power at command for all pur-

poses, which is obtained from the South Yuba canal, the pressure being 200 feet. The prospects of this old mine, which was once a good dividend-payer, are considered excellent, and when the new mill is ready the drifts and stopes will be opened up sufficiently to keep it constantly in operation.

Placer.

IOWA HILL.—*Republican*, Sept. 4: The supply of water for mining purposes on the Iowa Hill divide is very limited this year. At the Morning Star they have water only about 20 hours a week, and they are cleaning up from 40 to 50 ounces a week, which is the yield of half an ounce to the carload. The Pioneer mine is developing splendidly, and their new machinery is now on the way from San Francisco. They have struck a big body of ore in the south drift of the 340-foot level of the Pioneer, which Superintendent Lightner reports to be 30 feet wide and worth \$10 a ton. At the Red Point they are short of water, but are driving gangways and preparing to lay 6000 feet of 7-inch pipe to bring water from Humboldt canyon. There is plenty of water in the canyon. Twenty inches are running now, and this is the driest season known for years. When this water is led to the Red Point mine it will be sufficient to run their blower and to wash all the gravel. The gravel from the gangways averages \$5 to the carload and improves as they go east. J. B. Hobson is driving a prospect tunnel with two shifts of men at Indian Springs, above Red Point. He has broken into cement and will soon sink a shaft. The Hogback tunnel is in over 600 feet, and has lately been running through some very hard rock. The first upraise will be made at 1100 feet, which they expect to reach the latter part of October. At the Drummond mine near Cottage Home, Mr. Hobson has sunk a new shaft 500 feet deep just south of the old works, and has developed a new ledge seven feet wide, which goes about \$10 a ton. William Cameron has bought the right of redemption of the Golden Gate mine, formerly the Bowley claim. The price was something over \$3000, and Mr. Cameron will open it as a drift mine. H. Hoorman at Wisconsin Hill is opening up his claim for drifting, and the gravel yields \$4 a car on the dump without crushing. His mine is on the same channel as the Morning Star. J. J. McIntire is pegging away on his prospect tunnel. All the miners say that the Pioneer is the coming quartz mine in the country.

ON THE FOREST HILL DIVIDE.—The old Dardanelles and the Baker Divide Companies having opened their mines and equipped them with first-class plant, are now operating with success. The Paragon mine at Bath is paying richer than ever. A short time ago an extensive cave in the breast occurred, which uncovered richer gravel than had ever before been seen in the mine. According to report, the deposit pays \$20 to the carload, and is equally rich from top to bottom. The Gray Eagle shaft is down 350 feet in chocolate-colored cement, similar to that overlying the pay gravel in other mines in that vicinity. The shaft is deeper than any other shaft in the Spring Garden mining district. The pumps handle four inches of water. Ten men are employed in the Live Oak mine. The necessary number of drifts have been run to open up the mine for systematic working. The indications are that the mine will soon become good paying property. Sixteen men are at work completing the Mayflower tunnel. The work is progressing rapidly, and the time will not be long before the miners will be at work taking out gravel from this wonderfully rich channel. J. C. Scott has begun work on his Volcano Canyon mine. It is reported that William Muir has formed a company to run a big tunnel into the Divide at Michigan Bluff. It is intended to be the working tunnel of all the mines on the divide above Michigan Bluff. The work will be done by electricity.

Shasta.

GENERAL ITEMS.—*Republican Free Press*, Sept. 1: A. B. Paul of the Calumet mine and mill has added 20 stamps to his mill, and will shortly put in 20 more, also built a fine suspension bridge across the river. Parties from French gulch inform us that Baker, Fox & Johnson have discovered some good prospects on an extension of the Wheeler ledge, and that the whole country is alive with prospectors. At Squaw creek the new mill on the Croesus mine will soon be in operation. A 200-foot shaft is being put down on the mine.

Sierra.

ABOUT SIERRA CITY.—*Mountain Messenger*, Sept. 1: Sierra Buttes and Young America companies are steadily crushing with all their stamps. The Marguerite company is preparing to resume work. Mr. F. Morris will superintend operations. The Empire company, Gold valley, has begun again to develop its property. Mr. Helling is making great effort to bring the mine out, and all wish him success. The Buffalo mine, Hog canyon, looks very promising, and is likely to become the best paying claim in this vicinity. It is expected that a 10-stamp mill will be erected before snow flies. The Mountain ledge appears very fair. Messrs. Gunzburger & Sunderhaus are there superintending the work. The Kentucky company has ceased operations for a short time, and a 10-stamp mill is soon to be erected. Jack Lloyd and John Iseman are opening a new mine at Port Wine called "Catch It if You Can."

Trinity.

AT CINNABAR.—*Journal*, Sept. 1: Everything is in a flourishing condition at Cinnabar. The Altoona quicksilver mine is being worked by a force of about 12, who are engaged in getting out ore and developing the ledge. The company will soon begin working the ore and producing quicksilver. About a mile from the Altoona the Ducks are sloping in their claim and have done well this summer. Indications point to lively times in Cinnabar the coming year.

Tuolumne.

NEW MILL.—*Independent*, Sept. 1: The 40-stamp mill at the Eureka Con. mine is being erected with all possible dispatch. It is thought that it will be completed in about two months. It is doubtful, however, whether there will be any water to run it before the rains come. The Pinetum mine, situated near Turnback creek, is reported as looking exceedingly well. A drift has been run some 80 feet on the ledge; the width of the vein cannot be told, as it is continually increasing in size and no crosscutting has been done, but it is supposed to be seven or eight feet.

NEVADA.

Washoe District.

COMSTOCK MINES.—*Territorial Enterprise*, Sept. 2: The prospects for miners and workmen generally have been exceedingly blue on the Comstock on several former occasions, but they have seldom been worse than at the present writing. This comes more from the fact that outside mining camps in Nevada are in the dumps than from our own demerits, and from the further fact that great expectations were pinned upon the bright prospects revealed in our mines by the development of paying ore bodies which induced miners to invest their earnings, from which investments, owing to untoward circumstances, they have been unable to realize a dollar. Here they have invested their earnings of the past year, and here they propose to recuperate their fortunes. The outlook to do this is anything but propitious. There are nearly 500 more miners on the lode than can find employment under the most favorable circumstances. It takes money to make money. Wouldn't it be better for the surplus miners to go elsewhere to earn the means with which to recuperate their fortunes than to drag further in debt and be unable to take advantage of opportunities that may be offered in the future? Everything is at a comparative standstill on the lode, and will so remain until milling power is afforded by winter snow and rain, when operations will be resumed on a scale commensurate to afford employment for a number of men 500 less than are now working or desiring work on the lode. This fact is self-evident, and working men should properly digest it rather than trust to their lucky stars, and swallow disappointment instead of beefsteak and Dayton potatoes at the outcome. By throwing off our extra working population every line of business and the workmen themselves will be benefited. Our unemployed men the year around is the biggest drag-net from which we suffer, and they are doing great injury by staying here. If this is not sound or plain talk, we would like to know its fallacy.

CON. CAL. & VIRGINIA.—On the 1300 level continue retrimbering the main south lateral drift. Continue to extract the usual quantity of good ore from the stopes east of the winze sunk below the 1435 level. On the 1500 level are continuing to extract ore from the southeast drift run from the upraise above the parallel north drift, 58 feet above the track floor of this level. The east crosscut from the main south drift is in 242 feet and has connected with the southeast stopes on this level. On the 1600 level continue to extract ore from the stopes around upraises Nos. 1, 3 and 4. An east drift from the top of the upraise at the north line has connected with a west crosscut from the north drift from the Con. Va. shaft on the 1500 level, making a valuable airway. On the 1650 level, the upraise above the drift running south from the east from the Con. Va. shaft is up 23 feet. Ore is being stoped from the south drift. During the week 1174 tons and 270 pounds of ore were shipped to the Morgan mill, and 1565 tons to the California mill. The average assay value of all the ore worked at these mills during the week, according to battery samples, was \$35.20. Bullion valued by assay at about \$65,000 now on hand in local office. Bullion shipped to the San Francisco office during the past week valued by assay at \$70,966. The Yellow Jacket shaft stopped work yesterday, and of course the shipments of ore to the Brunswick mill from the Confidence mine, which was hoisted through it, have ceased. During the stoppage the foundation under the hoisting machinery will be supplanted by new timbers, which are now on the ground. Everything is out of plumb, causing the breakage of spur wheels, etc., and the work is imperative. The repairs will occupy fully a month, during which time the mill will also be overhauled. Below we give such information as we have been able to obtain in regard to the leading Comstock mines.

HALE AND NORCROSS.—Since last report have hoisted 1250 tons of ore from the 600 and 700 levels, and have shipped to the Nevada mill 1190 tons. Average battery assays \$41.64 per ton. The stopes throughout the mine are looking very well. The west drift from the 500 station has been advanced 85 feet, making its total distance 275 feet. Have bullion on hand and previously shipped amounting to \$70,400 on August account.

SAVAGE.—Since last report have retrimbered 57 feet of the main vertical shaft, and a few days more work will leave the shaft in good working order. The south drift on the 500 level has been advanced 44 feet, making its total distance 244 feet. The car samples from the face of this drift average \$30 per ton. Are prospecting and easing timbers on the several levels of the mine.

ALTA.—Extracting the usual quantity of ore from the 825 level, and the mill machinery is running smoothly. The Keystoke machinery is also running well, and sinking to crosscut with the upraise from the 605 level has been resumed. Are opening a new station in the Alta and running a drift to the west to cut the vein on the 725 level.

OCCIDENTAL.—In the lower tunnel, 150 feet south of the north incline winze in the south drift, at a point 145 feet from the main tunnel, east crosscut No. 2 has been extended four feet; total, 17 feet. Extracted 132 tons of ore and shipped to the Douglass mill 150 tons the assay value of which per wagon samples was \$32 per ton.

BELCHER.—On the 570 level east crosscut is out 185 feet. No change to report in the ground. The face is in soft porphyry. The repairs to the vertical shaft are completed. Are repairing the sheave at the head of the incline. The Sutro tunnel drift is out 620 feet.

UTAH.—On the 472 level, in the north lateral drift opposite west crosscut No. 5, or 150 feet north from the point where the incline upraise was carried to the 372 level, an east crosscut has been advanced 32 feet. The formation is porphyry showing streaks of quartz.

GOULD AND CURRY.—All the work during the week has been confined to repairing the main shaft and airways leading to the old stopes. Have discontinued shipping ore to the Douglass mill, as the yield per ton was below the cost of extraction and milling.

MEXICAN.—On the 1465 level a joint Union drift started from the east drift from the Ophir shaft at a point 150 feet in, is advanced 110 feet.

CONFIDENCE.—Last week shipped 182 tons of ore daily to the Brunswick mill, average battery samples of which were \$26.50 per ton. Shipments stopped

yesterday owing to the closing down of the Yellow Jacket shaft for repairs.

JUSTICE.—Are running north, southeast and east on the 600 level and taking out ore as it comes in drifting without stopping. Are hoisting about 15 tons daily, and have about 2500 tons of milling ore on the dump.

ANDES.—From the west drift on the 350 level are now going north in a streak that looks promising, yielding a little ore. Are going south on the 240 level from the west crosscut on a streak that is looking well.

CROWN POINT.—The south drift from the 201 level crosscut is in 28 feet, having advanced 28 feet during the week. The face is in soft porphyry, showing seams and streaks of quartz.

YELLOW JACKET.—Stopped the hoisting works yesterday. Will put a new foundation under the machinery. The work will take a month. The shaft itself is in first-rate condition.

OPHIR.—On the 1465 level the old east drift is reopened 150 feet. The southwest drift from upraise No. 2, 36 feet above the track floor of this level, is still being retrimbered.

BEST AND BELCHER.—On the 1300 level the north drift repairs have been completed, and have resumed work in west crosscut No. 1 from the El Dorado tunnel level.

SEG. BELCHER.—The south raise is now up 60 feet vertically above the southeast drift. No change to report in the ground run through.

SIERRA NEVADA.—On the 520 level, east crosscut No. 3 is advanced 292 feet. It is still in porphyry with clay slips showing some water.

BENTON.—Worked has ceased. President Hill is expected on the lode shortly, when operations will probably be resumed.

CHOLLAR.—Are doing the usual work of prospecting and repairing in the mine, but are not hoisting ore at present.

ALPHA AND EXCHEQUER.—Drifting north on the 382 level and sinking and timbering the shaft below the 500 level.

IOWA.—Nothing new to report this week. Are making tests of float rock and also of rock near the surface.

CHALLENGE.—Prospecting on 1000 level continues and repair work throughout heavy ground in the mine also.

BALTIMORE.—Are crosscutting in the ledge on the 338 level. Upraise No. 2 in very good ore.

BULLION.—Are drifting south on the 640 level and are crosscutting east on the 500 level.

SCORPION.—The south drift on the 500 level has been extended 15 feet during the week.

POTUSI.—Progress only is reported in the work of exploration and repairs in this mine.

UNION CON.—[Report is identical with that of Mexican.]

Belmont District.

SPANISH BELT.—*Courier*, Sept. 1: The Barcelona mine, Spanish belt, never looked better than it does now. There is an abundance of rich ore in sight ready for stoping, and sufficient low-grade ore to keep two or three concentrating-mills steadily employed can be easily extracted. The Monitor Belmont mill ought to be repaired and the high-grade ores worked at home. This mine is one of the most extensive on the coast, and when it is properly opened by a perpendicular shaft of sufficient size for its advantageous working, it will prove one of the most productive mines in America.

OTHER CAMPS.—The mines of Northumberland district are producing good ore. James Latt's mine, East Belmont, is producing high-grade ore. Only 14 men are now at work on the Seligman. There seems to be a general depression all over the State, and very many men have in the past month been thrown out of work. Two teams of ore left yesterday for Eureka—Matson, with about 15 tons from Swansea Canyon, and Isaacson with about six tons for Jacobson & Simons. The following shipments of ore were made last week to the Eureka furnaces: From the Sub Rosa mine, 2½ tons; White Pine, 7 tons; Revelle, 1½ tons; Williamsburg, 4½ tons; Mineral Hill, 1½ tons; Lincoln, 4 tons; Northumberland, 5 tons; Tybo, 8 tons; Kentuck, 2½ tons; and Dimmick, 1½ tons. From the Leonie mine, 32 tons; Members, 29 tons; and Silver Conner, 56 tons.

Candelaria District.

MOUNT DIABLO MINE.—*Walker Lake Bulletin*, Sept. 1: The winze below the sixth level is down 13 feet and shows a few inches of low-grade ore. The crosscut in the intermediate east of the shaft, between the fifth and the sixth levels, has been stopped and a drift started in the ore found in this crosscut. In the west intermediate between the fifth and sixth levels we have two small stopes, both yielding ore of fair grade. The main stope between the fourth and fifth levels is giving some \$60 ore. The west stope above the fourth level shows some improvement. The east stope on the third level now shows but little ore. East of the shaft between the second and third levels we have a stope on a small lode that looks promising. The banging stope between the second and third levels shows five inches of \$300 ore. The east stope above the second level is giving considerable \$30 ore. The intermediate stopes between the first and second levels show no change. We have a north crosscut between these levels that is now in 16 feet and shows a few inches of \$300 ore. A north crosscut has been started from the west drift on the first level and is now in 23 feet. The east drift above the first level is in 259 feet. The stope above this level shows no improvement.

Pioche District.

YUBA MINE.—*Record*, Sept. 1: The winze of this mine from the 11th level has reached a depth of 12 feet, showing the vein of high grade free ore to continue regularly in width and richness. The last vein sample at a point where the width was 13 inches assayed 500 ounces silver per ton. The crosscut from the 12th has now, in ten days' time, penetrated north toward the ledge 30 feet. This remarkable progress was owing partly to the existence of an open fissure running with the work across the country toward the main ore fissure. The Yuba Co. has heretofore been paying \$75 per month for water from the Floral Springs, for their hoisting works. The management of the estate of the late R. H. Elam, who owned the water, decided to raise the price to \$150 per month. As this does not meet the views of the

Yuba Co., its managers have decided to obtain water by hoisting through the Pioche Con. Co's. No. 3 shaft and pump it thence to the Yuba, which is about 250 feet higher.

Hawthorne District.

STRUCK ORE.—Esmeralda *News*, Sept. 1: The Black Hawk mine is situated about a mile north of the Lapanta, in Hawthorne Mining District. It is owned by B. Prior, the well-known and indefatigable prospector, who has been at work on the claim for the past two and a half months. In that time he has sunk a shaft 18 feet and run a number of drifts. While engaged in sinking the shaft, he extracted some 15 tons of ore (now on the dump) which he estimates is worth \$50 per ton. At the bottom of the shaft, Mr. Prior uncovered a three-foot ledge of ore, assays from which go all the way from \$100 to \$200 per ton in gold. According to present indications, Mr. Prior has a nice stake.

Tuscarora District.

WORK ON THE MINES.—*Times-Review*, Aug. 31: Work on Del Monte has been suspended in the tunnel and the joint shaft sunk 8 feet.

GRAND PRIZE.—First drift, 200-foot level, has been extended 10 feet and west drift 12 feet, face of both showing low-grade ore. A great deal of ore has been left standing in the stopes from the 200 and 300-foot levels, but is mostly low-grade for milling. Work in all parts of the mine has been suspended for the present, for the purpose of repairing the shaft, preparatory to freeing the mine of water to the 400-foot level, after which that portion of the ore body extending downward from the 300 foot level (that lying above having yielded over \$100,000 in bullion during the past six months) will be developed on down. On the Commonwealth and the Nevada (Queen developments and ore extraction are being prosecuted with the usual energy and success.

FOUND TREASURE.—Southeast drift on the southwest vein, 150-foot level, has been extended 10 feet. Upraise No. 3 will connect with the drift of the 100-foot level by to-morrow. The dirt which had run into the crosscut and drift of the 200-foot level has been cleaned out, and work has been resumed in the face of the southeast drift.

NAVAJO.—The crosscut from the south drift, 350-foot level, has been extended 6 feet. North drift from No. 2 winze, east vein 250-foot level, extended 9 feet, face still in good ore. South drift on west vein, 150-foot level, extended 8 feet. The stopes on the 300 foot level continue in high-grade ore.

NORTH BELLE ISLE.—East crosscut No. 2 north, 300-foot level, extended 5 feet. The stopes on the 300-foot level continue in high-grade ore. The joint upraise on the 400-foot level is up 20 feet, showing high grade ore all the way.

ON THE NORTH COMMONWEALTH.—Work has been discontinued in the prospect shaft and level and the joint shaft has been sunk 8 feet.

ON BELLE ISLE.—East crosscut, 250-foot level, extended 8 feet in hard rock. The stopes are without material change.

ARIZONA.

CAMPS ABOUT PRESCOTT.—*Journal*, Sept. 3: Five tons of ore from Slate creek, the first shipment of carload lots, arrived yesterday at the sampling works for George Sines. He expects the balance of the carload within a week. Supt. Williams of Copper basin is not pushing work very rapidly on that property, his motto apparently being to "go slow, but sure." Notwithstanding the absence of any hurrah, he has done a great deal of work there in the past few months. He has taken out large quantities of ore and has opened up very much more. Work of erecting a smelter has commenced and the machinery for a new sawmill for the company has arrived. We expect to see a steady progress and improvement there until the camp becomes one of the largest in Northern Arizona. H. A. Owens is developing the property recently located by him on the Santa Maria with very satisfactory results. The ore is very high-grade gold.

GREAT EASTERN GROUP.—This group of mines has now become one of the most promising properties in the Vekol range of mountains. It lies in one of the largest basins of the range and joined to the Vekol as it is, it has become as prolific in substantial production as the former. On the first of September the Vekol mill starts on Great Eastern ore. This is the third large run this year. A short line of railroad over a level country about 25 miles to the Great Eastern and Vekol range of mountains, would bring into existence the most prosperous mining camps on the Pacific Coast. The Queen of Sheba silver mines in the same range are expecting pushing and active development very shortly.

COLORADO.

EAGLE RIVER DISTRICT.—Red Cliff *Times*, Sept. 1: The Champion is putting in a new engine and hoister and preparing for large shipments. J. B. Taylor has taken the lease on the Pine Martin. He has some ore in the breast that runs 20 ounces in gold. The Blue Bell has a streak of galena and sulphide in the breast which averages six inches. The property is steadily improving. The Black Tiger heading is working under contract to William Gay & Co. Work has ceased in the rest of the mine until the contract is finished. The Last Chance lessees took out some ore last week that made the eyes of old-timers stick out. Sulphides massed with gold, and brown hematite literally covered with the ore. The Polar-Accidental is now in 800 feet. The main incline has been in ore for the last 140 feet, and is still going through ore. This is one of the best properties on Battle mountain. The ore from the mine at present is coming from drifts only, no stopping being done. Fred Thackwell opened up a 5-foot body of hematite iron on the Mexican Maid, in the lime contact. This iron occurs in the ore bodies on Battle mountain. The prospects are encouraging for a large body of ore. The strike is about 15 feet from surface. The lessees on the Horn Silver have struck the edge of the main ore-channel this week after running a crosscut 150 feet off the main incline. A two-inch streak of horn silver and chlorides, assaying \$2000, is part of the find. Messrs. Smith, Hahn, DeLee and Mays displayed good staying qualities and judgment in the prosecution of this work, and we are pleased to note their well-merited success.

LEADVILLE.—*Chronicle*, Sept. 3: The Lee Basin Company is not getting as much ore out of the

Olive Branch mine as it was a few weeks ago, and shipments have fallen off to about 500 tons per month. The ore is, however, of much better grade. Not a lot has been shipped for over a month which has assayed less than 100 ounces of silver. The Olive Branch workings are in ore everywhere, except one drift which is being driven south from the incline for prospecting purposes. The breast of the incline is in ore, and back-stopping has been commenced from it on both sides. The incline is to be driven ahead again very soon. The Lee Basin Company can drive ahead 200 feet more under the terms of the Olive Branch lease. The scheme of sinking a new shaft in the center of the park to command this ground, has been abandoned for the present. The Olive Branch ore is shipped to the Boston & Colorado Smelting Company. In the Lee Basin territory, worked through the Tiptop, the ore which was struck some time ago is becoming low grade. There is a considerable amount of it, but it is too poor to ship. The ore is sulphide and oxide in lime. Experiments with concentrating it are to be made. There are some streaks of gold ore running through the bodies of low-grade ore, and drifts following them are being driven. The company is taking out about 200 tons per month from them. The stock of the Lee Basin Company is selling in New York for 70 cents per share.

SILVER PLUME DISTRICT.—*Standard*, Aug. 31: The Hall tunnel is now in about 600 feet and is being driven from 20 to 25 feet per week. A vein of ore one foot in thickness and worth \$150 a ton, has been opened in the Lucy group of mines. Jerry Burns is pushing work ahead on the lower adit of the County Treasurer lode in West Argentine. A 2-foot vein of solid ore has been opened in the fifth level, east of the main shaft in the Jo Reynolds mine. Tom Powers milled a small run of ore last Saturday from his Delaware lease that netted in one class 184 ounces of silver to the ton. In the month of July H. M. Griffin sold 250 tons of ore from his mines near here, containing 13,000 ounces of silver, 100 tons of lead and a small quantity of gold. There is at present considerable ore coming out of Brown gulch and all of it is of good grade, thereby allowing the lessees up that way to receive good returns for their work. Sadlier, Myroie & Co., lessees on the upper Mammoth, are at present stopping on a large-size streak of ruby and gray copper. The lessees also have the nicest ore-house that we have seen lately.

DAKOTA.

MINES ABOUT DEADWOOD.—*Pioneer*, Sept. 1: The Homestake Mining Company of Dakota paid August 25th dividend No. 121, of 20 cents a share, aggregating \$25,000, making \$200,000 paid this year, and \$4,198,750 paid to date. Twenty-five bars of 70 pounds each, bullion from the Bullion-Merritt smelter, were brought over yesterday and piled up in front of the Deadwood bank. At the Jumbo group of mines, two miles east of Deadwood, the work of development goes on apace. Two incline shafts have been sunk in ore, the one to the depth of 80 and the other 200 feet. The ore is a carbonate and galena vein four feet thick, average assay of ore 566 per ton. Work on the Anna mine consists of one tunnel 250 feet long following the ore vein and another 300 feet. At the end of this tunnel is a shaft which was sunk in a large body of ore. This is free-milling gold ore assaying \$18 per ton. Adjoining this mine on the south is the Ophir group, consisting of three claims. The workings on the Ophir are situated about 100 feet from the Anna and also on the same vein bearing the same class of ore. The development of this property consists of three large open cuts, also an incline shaft to the depth of 100 feet. Eight miles farther south is situated the Neptune group of mines, where work on shaft and tunnel is being actively prosecuted. Farther on at the village of Perry is the Uncle Sam mine. Some years ago when this property was owned by prospectors, a narrow vein of free-milling gold ore was discovered upon which was placed a one-stamp mill with the capacity of one ton per day, and a result of \$100 per ton. With the profits of this mill they were soon enabled to erect a 20-stamp mill, which was in successful operation when it was sold to New York capitalists, who immediately erected a 60-stamp mill and also large hoisting works. A large Cornish pump having recently been purchased will soon be erected on the works and operations resumed. The mine under present management promises to be one of the largest bullion-producers in the Black Hills. East of the Uncle Sam is the El Dorado group of mines, consisting of three claims. This property has quite an extensive development and is mostly owned by prospectors.

DEADWOOD.—*Pioneer*, Sept. 1: We were shown an assay of carbonate ore from the Ontario mine which will average \$95 per ton, and it is said they will soon have a good body of that kind of ore, as it is gradually widening. This will at no distant day be one of the best producing mines of the galena camp. There is no doubt but that this will soon come to the front of the producing camps of the Black Hills. Those who are working as hard as Lynn and Sebastian certainly deserve success. The Merritt-Bullion Smelter Company paid off yesterday. Some \$700 were distributed among employees.

IDAHO.

ELK CREEK.—*Cour d'Alene Record*, Sept. 3: Development on the Elk Creek group of gold mines continues with unabated vigor. To say that they improve in appearance as work progresses is but faintly to express the exact condition of affairs. The results obtained in the mill, although working on the lowest grade ore yet found in the vicinity, are proof sufficient of the great wealth contained in this auriferous region. The camp is full of life and animation and 100 men, including miners, carpenters and other mechanics, are on the payroll. Elk Creek has been tapped 1800 feet from the mill for an additional supply of water, and a number of men are now employed in putting in a flume for that distance. The work of increasing the capacity of the mill to 20 stamps is progressing, the additional batteries are now being put in place. A partial cleanup on Thursday yielded three bars of gold weighing 17 pounds worth \$17,40 per ounce, making a grand total of \$3549.60.

SUNSET PEAK.—Sunset Peak rises in majestic grandeur from the midst of surrounding mountains and clustering hills, mighty in themselves, but insignificant when compared to the towering high-

occupied by this grand old king of the Cour d'Alene. On this exalted station are located a group of mines owned by the Portland Mining Company and known as the Silver Tip, Sitting Bull, Red Dragon and the Mule Deer. The chief development work has been confined to the Silver Tip and Sitting Bull. On the first named a shaft is down 60 feet with considerable drifting in the bottom which shows an ore body 14 feet in thickness. There are other minor openings, displaying the same body of ore which carries galena, gray copper and sulphuret of copper. The work on the Sitting Bull consists of two tunnels driven on the vein, which is the same as the Sunset, to an aggregate distance of over 3000 feet. The company is now engaged in building roads, ore dumps, trails and house, and is making every preparation necessary for winter work. Supplies of all kinds sufficient for a season of six months for a force of from 12 to 20 men will be in store before winter sets in. The buildings will be all completed by the 15th of September, so that no cessation of work can be anticipated from inclement weather. Railroad surveys have been made and it is expected that this mining district will be on a shipping basis within the next 12 months. The ores of the district average as high a grade as those found in the best mineral zones of Cour d'Alene, while the veins are fully equal to, if not stronger, than any yet discovered. The vein system of the Sunset Peak can properly be classed as a mineral zone, in which occur several distinct veins, not less than four in number, and indications point to the existence of two others, making the entire width of the mineral zone about 2000 feet. These veins run parallel to each other and vary in width from one to 20 feet—the central vein, on which is located the group above referred to, being the most prominent, probably from the fact of its being the most developed; while the physical structure is identical to that of the other vein systems of Cour d'Alene, that is, they cut the formation at an acute angle, and the formation here as in other districts is composed of ferruginous slates, while the vein gangues are quartzite.

BEAVER DISTRICT.—The Fay Templeton Mining Co. is now erecting two of the largest sized Huntington mills that are guaranteed to crush 50 tons of ore per day. The machinery will be shipped from Chicago on next Tuesday, the 28th inst. The mill-site which is right at the mine has been prepared and the mill buildings and flumes now under construction will be completed and ready for the machinery when it arrives, which will be in about three weeks. The Fay Templeton mine has developed wonderfully of late, and now exhibits one of the largest bodies of quartz to be found in the camp, the vein at places showing a thickness of 30 or more feet. Several hundred feet of tunnel work in good quartz have been already driven and thousands of tons of ore are on the dump ready for the mill. An arastra crushing a ton a day has been running all summer at great profit, the first run averaging \$22 per ton, and since then the product has steadily increased, the last run averaging over \$40. Unless all indications are at fault the mine will prove a bonanza to the company as well as to the camp. The introduction of the Huntington mill will be a novelty in Cour d'Alene, and to many will look like an experiment, but the Fay Templeton people have given the matter a thorough investigation, and they feel satisfied that this method of crushing will give better results than could be obtained from the use of any other tried mill. There are many of these mills now in use in California and Mexico, and from the sworn statement of the receiver of the Spanish mine of Nevada county, Cal., no other mill can crush as much quartz as economically as the Huntington. It is hoped its erection on this mine will verify his statement. The process is a combination of the stamp-mill and arastra, and is highly recommended for its amalgamating capacity.

MILE GULCH.—Work is progressing favorably on the Last Chance mine. The lower tunnel is in 200 feet, a distance of four feet being gained in its extension every day. A further distance of 200 feet will have to be attained before the vein is cut. The levels east and west of the upper tunnel are being driven continually, eight-hour shifts being employed. From three to five feet of good concentrating ore is visible in these workings, and in the stopes a body fully five feet in width is exposed. There are now 2000 tons of ore on the dump. The concentrator for the treatment of ores from both the Emma and Last Chance mines is rapidly nearing completion. One carload of machinery has been delivered, and if no delay occurs in the arrival of the other portions of the plant the mill will be ready to work by the 15th of next month. The tramway from the mines to the concentrator is nearly finished, not over 300 feet of additional work being necessary to complete it.

THE STEMWINDER.—The engine whistle of the concentrating works at Kellogg is again heard, and the buckets of the wire tramway are once more seen making their regular trips from the Stemwinder mine to the mill. This well-developed lode is again added to our list of shippers, work having been resumed at the concentrator on Wednesday, and will in future continue treating ore from the Stemwinder mine.

BUNKER HILL & SULLIVAN.—The Bunker Hill & Sullivan Mining and Concentrating Co. declared a dividend on Saturday, the 18th inst., of \$40,000. An immense amount of ore is now in transit from the mines and another and larger dividend may be looked for at an early day.

MONTANA.

PLACERS.—*Inter-Mountain*, Sept. 3: The placer diggings in the Sweet Grass Hills in Northern Montana are now being worked to good advantage. The old-time miners are making money there, and quartz claims are being located rapidly.

VARIOUS MINES.—The Granite Mountain Mining Co., Deer Lodge county, gives in for assessment its net output for the year ending July 31st at \$2,200,000. Work at the company's mill-site is making good headway, though the hard nature of the country rock makes progress a little slow at times. About 175 men are now employed and it is expected that several more will be put to work soon. The railroad right-of-way has not been definitely settled for the entire distance yet. The Cumberland Co. last week shipped from Castle 74 tons of ore. The net receipts for the month of July amount to \$4600. The number of tons shipped for the month is 175. The Champion shaft, now 170 feet deep, is going down two feet per day on the

vein; there is ore clear across the shaft, and 18 inches will assay 300 ounces. The new li-Metallic hoisting works at the mine are being pushed ahead with great energy, and will probably be completed in about 20 days. Will soon employ as many men as before the fire, and expect to resume operations and take out ore in about six weeks.

THE BIGGEST HOIST.—The Drumlummon mine is now engaged in putting in the largest hoist in Montana, if not one of the largest in use in any mine in the country. The hoist is located 600 feet under the ground, and is capable of hoisting to a depth of 5000 feet. A large excavation has been made at the 600-foot station for the hoisting plant, which will be walled and arched with solid masonry.

ABOUT BOULDER.—*Age*, Sept. 3: W. B. Gaffney has some excellent properties near Hecla, in Beaverhead county, and is considering an offer from Butte parties to bond them for the sum of \$50,000, with a considerable sum put up as a forfeit if the mines are not taken. Work on the Bigfoot has been temporarily shut down, owing to the large amount of water coming into the shaft, which is now down 130 feet. Additional pumps will be put into the mine shortly so that the work can be resumed. The outlook for the mine is very promising. The shaft on the St. Paul lode is now down 65 feet and its owners have determined to sink 100 feet further. To that end a whim is being built and necessary buildings to live in are being erected. The property is a very promising one, and the owners are determined on finding out what there is in it. They have a six-foot vein of good ore.

WISCONSIN CREEK MINES.—A bar of gold valued at \$2000, the product of Champion mine, has been brought in. It is from the lowest grade ore in the mine, and was turned out in 20 days' run of a five-stamp mill. The vein is in granite, and the ore body opened is 160 feet long and four feet wide. The ore mills on an average about \$23 per ton. The best ore yet developed in any of the group is in the Sheridan, 20 inches wide, opened for 60 feet along the vein, a depth of about 60 feet. This ore is all of excellent grade, and will run from \$50 to \$100 per ton.

JEFFERSON COUNTY MINES.—*Review*, Sept. 1: The Minah mine, in the vicinity of Wickes, is showing up splendidly and making regular shipments of ore, part of which goes to Omaha and part to Wickes, the high-grade ore being worked at the former place. For the past two weeks the smelter at Wickes has not been running full capacity, one of the three stacks having been shut down for repairs. Everything is now in good shape and the smelter in full operation. Prospecting around Wickes is brisk, the hills are dotted with searchers for the precious metals, and owners of claims are doing their assessment work. The increasing demand for lead ore is giving a great impetus to mining and bracing up the heart of the prospector with that most healthful of tonics—energy and hope.

NEW MEXICO.

LOROSBURG.—*Eastern Liberal*, Sept. 3: The Volcano mine started last week. A Santa Fe man claims to have learned from the Spanish records just where a valuable quicksilver mine is, and wants to be grub-staked while he prospects for it. Jeff Whittington was in town Saturday on his way to El Paso with 6 tons of ore for smelting. Eleven tons are from the Comstock and five from the Silver Twig. The ore is of a very high grade, as it has to be to stand a shipment from Morenci to El Paso. Superintendent Foster received orders to shut down the Standard mill, which he did Monday. We are not informed as to the reason of the shut-down, but are certain it is not for lack of ore, nor from unsatisfactory mill returns. The company shipped about 20 tons of high-grade concentrates and a \$2400 gold brick this week.

DISPOSING OF ORE.—Miners often receive unsatisfactory returns from miners after shipping ores to them. This may often happen because the smelters do not need just the class of ore they ship. In Denver there is a good system of handling ores. The Union Pacific Ore Sampling Works send a sample of all ores they receive to six different smelters and the smelters bid on it, the ore going to the highest bidder. The company recently issued a bulletin giving the bids on 14 different lots of ore, and it was quite interesting to note the range in prices.

CARLISLE COMPANY.—This company intends in the future to make Lordsburg its shipping point instead of Duncan. It will take 25 or 30 teams to do the work, hauling concentrates into town and coke and supplies to camp. As the supplies for the teams and drivers will all be handled here, this will be something of an addition to the business of our town.

DITCH AT LAS CRUCES.—*Republican*, Sept. 3: An El Paso surveying party is running two lines from the mouth of the Mesilla valley ditch to intersect the old ditch at some point near the bend on Earham lands. The ditch mouth is pronounced by the engineers as good as any in the valley.

WASHINGTON.

DEEP CREEK.—Spokane Falls *Herald*, Aug. 26: Apparently valuable lead deposits are said to exist on Deep creek, near Colville. Jos. Campbell and Gus Henderson have some hearty looking claims there.

HOPE STATION.—Several of the ledges here are showing up well. Jas. A. Donaldson was in town during the first of the week from near Hope Station, Idaho. He is interested in several mining claims in that vicinity which show up well. Considerable of the ore assays high in silver and lead, while some is rich in gold. There are several healthy looking leads across Lake Pend d'Orielle from Hope.

WYOMING.

COAL MINES.—*Tribune*, Aug. 28: One of the largest bodies of coal in Central Wyoming is said to be in Bates Hollow, on the North Platte river, where veins of coal cross running north, south, east and west. On one section of land are to be seen cropping out 26 distinct veins of coal from 3 to 13 feet thick. It is reported that Shibly Bros. of Nebraska, who own a half interest in the property, are perfecting arrangements to open it up as soon as shipping facilities can be secured.

MECHANICAL PROGRESS.

Construction of Steam Cylinders.

The triple and quadruple expansion marine engines of recent introduction call for very high boiler pressures. Several steamships now carry 170 pounds of steam. With the late two-cylinder compound system the gauge pressure was generally about 85 pounds. The cylinder was calculated as to thickness to resist a working tensile strength of about 2000 pounds per square inch of section, though some were subjected to only 1200 pounds. The thickness of such cylinders varied from $1\frac{1}{2}$ inch to $1\frac{3}{4}$ inch thick. Of course one inch in thickness was ample to withstand the steam pressure, but there are other points that need consideration, such as re-heating, handling, water shocks from pressing, etc.; hence the extra thickness.

The 42-inch cylinders now in actual use on modern triple-expansion engines, where the initial steam pressure is 170 pounds above the atmosphere, are usually from $1\frac{1}{2}$ to $1\frac{3}{4}$ inches thick, and are, when jacketed, in most cases in the form of linings, so that the space between the lining and the main casting is filled with live steam from the boiler, thus forming a jacketed cylinder.

For the highest steam pressures, initial steam cylinders up to 50 inches diameter need not be more than two inches thick, and if there is no jacket, the reinforcing ring or rib can be introduced. Cylinders so reinforced can be re-bored until the thickness is materially reduced.

One great trouble with all large steam cylinders is the warping, or drawing, and a general distortion of the walls of the cylinder, when heated, this action being very prominent in those cylinders having large steam and exhaust chest, and passages cast on them. Some engineers have adopted the plan of making the cylinders very thick, in order to partly prevent this warping of the cylinder proper.

Such designs are entirely unnecessary, however, as the circular ribs will answer all the purposes of the extra thickness, and are far better when other points are considered.

As to the strength of the average steam cylinder, the greatest number of fractures appear to have been caused by longitudinal strains and blows (in line with the bore) received during periods of excessive priming of the boilers and racing of the engines.

To prevent this liability of fracture, two or three large lugs are sometimes cast on the upper and lower flanges of the cylinder. Through these lugs from one end of the cylinder to the other, large, soft-steel bolts are passed. These bolts are brought to a uniform stress, while the cylinder is at its average temperature. Under these conditions, when any undue strains or shocks occur, the force of these strains is immediately transmitted to these tension bolts, which, being of superior tensile strength, relieve the body of the cylinder of at least one-half of the shock. No detail can be too safe in the construction of steam machinery for the marine service.

We condense the above from an article in the *American Machinist* by W. H. Hoffman.

EXTENDING AND IMPROVING BLAST FURNACES. Robert Grimshaw, in *New York World*, says: In our country the last two years have witnessed astonishing activity in the construction of new blast furnaces and steel works. One firm alone constructed 10 entirely new blast furnaces (eight of them being in Tennessee and Alabama), remodeled 10 more, and built six steel works, representing in all an outlay of over \$2,500,000. In connection with the construction of blast furnaces, the use of fire-brick hot-blast stoves and in preheating the blast is becoming more and more prevalent. A cast-iron stove heats the blast to say about 900° F., while a fire-brick stove can furnish up to 1600°. This extra amount of heat introduced into the blast decreases correspondingly the consumption of fuel, so that in well managed furnaces using good ores the past year has seen the lowest fuel consumption to the ton of iron ever reached in this country, and probably in the world. Published results show that one gross ton of iron has been made with 1850 pounds of coke, and many furnaces show an average record of between 1900 and 2000 pounds of fuel. Fire-brick hot-blast stoves have been greatly improved lately. They have been made more manageable, their construction more simple and the first cost lower. One firm constructs a special form of fire-brick hot-blast stove, combining the Whitwell and Cowper systems with certain valuable improvements patented by Mr. Fred W. Gordon.

THE LOCOMOTIVE ENGINEER.—The locomotive engine of to-day, says the *Railway Age*, is a marvel and a mystery to the casual observer, and very few except those engaged in making or running engines are aware of the number of appliances which the engineer has to manipulate or the uses to which they are put. A railway manager in speaking in regard to the work of the locomotive engineer once intimated that it required no particular skill to run an engine, as it was simply necessary to "keep the teakettle boiling." This was not a fair statement then and is still less so now when the complications of locomotive construction have been increased by the addition of various appliances not known years ago, such as the steam-driver brake, train brake, steam-heating apparatus, etc., while at the same time the requirements upon the en-

gineer in respect to speed, weight of train, number of trains to be looked out for, etc., have considerably increased. It is true a good locomotive runner does not need to be an engine-builder or even a good mechanic. His work is one in which expertness is gained by experience and care and is not a matter of superior education or book knowledge. But the really intelligent locomotive engineer will have some knowledge of the theory of locomotive construction, and it is an encouraging fact that of late years engineers have shown an increasing disposition to obtain books treating of their occupation and to make them a study. While an engineer need not be able to build an engine he must know enough of its principles to understand what to do in case of a break-down, and as a matter of fact very great skill and ingenuity are frequently exhibited by engineers and firemen in trying emergencies.

A NEW STEEL CASTING PROCESS has recently been introduced, which, according to *Industries*, bids fair to soon become a powerful co-operator in the great field which is daily enlarging and in which the manufacturers of steel castings and the world in general are reaping rich rewards. The process consists in passing molten steel or iron through a filtering medium or bath of a purifying and deoxidizing alloy of less specific gravity than either steel or iron; such bath or filtering medium rises and forms a stratum or film on the surface of the molten steel or iron, through which every particle of snaf steel or iron subsequently melted passes before reaching the lower part of the furnace from which it is tapped. The chief active component of the bath or filtering material is titanium. The alloy is produced in a peculiarly constructed cupola at the commencement of the operation, and is obtained by using an aluminous ore containing from 10 to 12 per cent of titanium. The stratum of alloy should be not less than one inch in thickness for each ton of ore to be treated. The steel on being passed through this medium as it melts is cleared of impurities and the resulting castings are free from honey-combs or blow-holes, and are of remarkable toughness. The inventors claim that the time required for annealing castings made by this process is much shorter than with ordinary castings, and that delivery can always be made in much less time. These castings will be very valuable for gun-makers for the manufacture of shells and other projectiles, and for whatever other purpose where toughness is required.

NEW SHAPING TOOL—A new device has lately been patented and put to practical use at a manufacturing institution at Fitchburg, Mass. It may be briefly described as a machine in which two flat surfaces, acting vertically or horizontally, and moving in opposite directions, with adjustable dies fixed upon them, roll in one motion a piece of metal regular or irregular in shape and of almost any pattern desired. At a single stroke of the mechanism may be obtained a sphere, a cone, a chair screw, a bolt with thread and head, a car or carriage axle, and an endless variety of other forms. The shop was visited by a large delegation from the Institute of Mining Engineers at its late session in Boston, and the visiting experts expressed themselves as very much amazed and delighted with the work of the machine.

MACHINE RIVETING continues to make progress and there are now several very useful apparatus on the market. It is no longer doubted that machine riveting is the best. During a recent visit to the Clyde we carefully watched the riveting machines at work, and also closely examined the work by the hammers, and were fully satisfied that the squeeze given by the machine tends to press up the shank of the rivet throughout its entire length, thus more effectually filling up the hole. The hammer only makes a succession of dents on the rivet end. In bridge-building, as well as in ship-building, the machine is fast superseding the hammer.—*Ex.*

HEAVY RAILS.—Steel rails weighing 90 pounds per yard have recently been rolled by the Bethlehem Iron Co. of Bethlehem, Pa., for use on the Reading railroad. These are said to be the heaviest steel rails ever rolled in this country. It is intimated that both the Reading and Jersey Central roads are going to renew the track on their main lines across New Jersey with much heavier rails than those now in use—from 89 to 92 pounds per yard.

PREVENTING ACCIDENTS FROM MACHINERY.—An exhibition will be held in Berlin next spring, under the auspices of the German Government, to disseminate a knowledge of the apparatus and devices that have been invented for the prevention of accidents among those engaged in the operations of machinery and all the various branches of industry. An invitation has been extended to the United States Government to participate.

SHIPPING ALUMINUM TO ENGLAND.—A telegram says that 150 pounds of chemically pure aluminum, smelted from Kentucky cryolite and clay, was exported this week from Newport, Ky., to England. The aluminum sold at 50 cents per tray ounce. A telegram adds that "the process of smelting is as yet a tedious one, and kept secret by the inventors."

One drop of oil per hour, regularly delivered, will lubricate a very heavy bearing.

SCIENTIFIC PROGRESS.

A Visit to the Past.

The books which have been written about Egypt during the past century are numerous; but it seems that we are really only at the threshold of the work of Egyptian discovery. It is not too much to say that the last ten years have added more to our knowledge of Egypt than the ten centuries previous. We may add that the work done in the past twelve months has been more valuable than that of any previous year of the ten.

Much of this work has been done by Mr. W. M. Flinders Petrie, an Englishman in the employ of the Egypt Exploration Society. It was he who in 1885 discovered the remains of Naucratis, a city so ancient that its very site had been forgotten in the time of the Roman Empire, and in the following year laid open the Ptolemaic palace at Tahpanhes. He has now won fresh laurels by the discovery, this year, of the pyramid of Hawara, and the labyrinth adjacent, which are said by ancient historians to have been far more wonderful than the pyramids which travelers go to see at Cairo. The pyramid, which was the tomb of Amenemhat III (Mœris of the Greeks), was described by Herodotus as being 240 feet high, and is said by other writers to have been the most renowned building of antiquity. In it the remains of its founder repose; it will remain there until Mr. Petrie returns in the fall, when it will probably be removed to stand by the side of the mummies of Rameses II and Rameses III in the museum at Boulak. This Amenemhat was one of the great engineers of antiquity. To him are ascribed the canals and reservoirs by which Northern Egypt—now a sand waste—was made to bloom like a garden. He laid out the labyrinth, which was described as the greatest of all the wonders of the world. And this great monarch, after a long reign, which was full of service to his country, and after a repose of several thousand years in a tomb so massive that army after army tried and failed to penetrate it, is now going to be set up in a glass case in a museum for Americans and Englishmen to look at.

Hardly second in interest to Mr. Petrie's discoveries at Hawara are the definite location of Bubastis and its famous temple. Bubastis is set down on all the maps as a ruin on one of the branches of the Nile, about a hundred miles north of Cairo. But it is in so desolate a sand desert, and there are so few remains of anything like civilization in the vicinity, that many have doubted whether this was the spot which had been the center of ancient fashion, and luxury, and pleasure, and frivolity 5000 years ago. It seems that it is. Remains have been found which must have belonged to the famous temple. It was a gorgeous edifice, situated in a grove, which was girt on all sides by an artificial branch of the Nile. It was dedicated to the Egyptian goddess Bast, who, though occasionally identified with the Diana as well as with the Venus of the Greek Roman mythology, was worshiped with rites which stamp her as the goddess of love. At her annual festival several hundred thousand persons, including the fairest maidens of Egypt, are said to have paid their devotion at the shrine. Herodotus gives a piquant account of the ceremonies with which the young ladies testified their reverence for their deity.

A gradual accumulation of debris has buried all these famous edifices several feet underground. To get at the rooms in the ancient buildings, shafts must be sunk and levels run at intervals. This renders the work of exploration difficult. But it has had the advantage of preserving the relics of antiquity in good shape. In the mortuary chambers of these old Pharaohs pictures are found with the outlines as sharp and the colors as vivid as if they had been laid on yesterday. To Egyptologists the characters on the scrolls are perfectly legible. The face of Rameses II now at Boulak is in perfect preservation. The only change produced by his thousands of years of rest is a slight indentation on his nose, caused by the tightness of the bandage in which he was swathed.

PROGRESS IN THE APPLICATION OF ELECTRICITY.—Little was added to our knowledge of electricity during 1887, but there was a remarkable development of its practical applications. One of the most important scientific discoveries was that sparks in tubes dissociated iodine, bromine and chlorine. Immense improvements have been made in the construction of dynamos, motors, accumulators and secondary generators, and in consequence the electric lighting and working of railroads and tramways has entered upon a commercial and useful stage. The application of powerful electric currents to smelting, as in the Cowles process for producing aluminum, and to welding, as proposed by Elihu Thomson, is gaining rapid progress, while the use of enormous dynamos for the deposition of pure copper from impure ores is gaining ground with giant strides. The application of electricity to propelling cars on city railways is becoming quite general. Extended trials of the method of employing secondary batteries carried upon the car, to actuate the electric motor, have been made in New York, Philadelphia and other cities, and with satisfactory results. The mode of gearing the motor to the axle of the car is now recognized as an element of the greatest importance, and the relative merits of steel spiral cords, chain-

gearing, conical disks, spar-gearing, friction gear, etc., are being discussed and experimented upon. Several ingenious methods for avoiding the use of a slotted conduit in connection with electric railways and employing continuous conductors have been proposed. There are now no less than 13 electric railways running in the United States and one in Canada, as follows: Appleton, Wis.; Baltimore, Md.; Denver, Col.; Binghamton, N. Y.; Detroit, Michigan (two roads); Gratiot, Mich.; Kansas City, Mo.; Lima, Ohio; Los Angeles, Cal.; Montgomery, Ala.; Port Huron, Mich.; Scranton, Pa., in the United States, and Windsor, Canada. In addition to those already in operation, there are seven in process of completion or started within a few months in the United States and one in Canada.

The Nature Created by Science.

But, a little later, that growth of knowledge beyond imaginable utilitarian ends, which is the condition precedent of its practical utility, began to produce some effect upon practical life; and the operation of that part of Nature we call human upon the rest began to create, not "new nature," in Bacon's sense, but a new Nature, the existence of which is dependent upon man's efforts, which is subservient to their wants, and which would disappear if man's shaping and guiding hand were withdrawn. Every mechanical artifice, every chemically pure substance employed in manufacture, every abnormally fertile race of plants, or rapidly growing and fattening breed of animals, is a part of the new Nature created by science. Without it, the most densely populated regions of modern Europe and America must retain their primitive, sparsely inhabited, agricultural or pastoral condition; it is the foundation of our wealth and the condition of our safety from submergence by another flood of barbarous hordes; it is the bond which unites, into a solid political whole, regions larger than any empire of antiquity; it secures us from the recurrence of the pestilences and famines of former times; it is the source of endless comforts and conveniences, which are not mere luxuries, but conduce to physical and moral well-being. During the last 50 years, this new birth of time, this new Nature begotten by science upon fact, has pressed itself daily and hourly upon our attention, and has worked miracles which have modified the whole fashion of our lives.—*Prof. T. H. Huxley.*

CHARACTER OF NITROGEN IN FERTILIZERS. Agriculturists complain of lack of important information in the analysis of fertilizers, in that they do not determine the character of nitrogen. According to the fifth bulletin of the Vermont Agricultural Experiment Station, Prof. Cooke has recognized this want and has been doing some important work in that direct line. He classifies the forms of nitrogen as follows: Nitrogen of ammonia salts; nitrogen of nitrates and organic nitrogen, or that which is in combination with animal or vegetable matter. It is fully time that there should be a recognition of the condition of availability of the nitrogen that is applied as plant food. The ammonia salts and nitrates being soluble in water are immediately available, but the case is different with the organic nitrogen, with the exception of dried blood, which, being of a nature to rapidly decay when subject to heat and moisture, soon yields its nitrogen to growing crops, but hoof and hornmeal, leather waste and similar nitrogenous substances require an indefinite time for decay and consequent availability. It is gratifying to learn that of 30 different fertilizers subject to examination upon this point, 14 show that not less than 80 per cent of the nitrogen is available, while the lowest gives a percentage of available nitrogen of 61 per cent. The highest stands at 89 per cent.

A TRANSPARENT DEPOSIT OF PLATINUM can be obtained by covering the bottom of a glass dish with a mixture of platinic chloride and glycerol. This is evaporated to dryness, and finally washed with alcohol to remove the product of decomposition of the glycerol. The metallic deposit is perfectly transparent, the transmitted light being of a dark blue gray tint. The commercial method of producing platinum mirrors by reducing the chloride with essence of lavender and heating the containing vessel up to the temperature at which the glass softens does not yield a sufficient cohesive product. Transparent layers of platinum and mirror deposits of iron, nickel and cobalt can also be obtained by electrolytic methods. It is noted that the iron mirror rotates the plane of the polarization, the direction of which varies with the direction of the electric current.

SAVING BY THE USE OF GAS-METERS.—The city of Providence, by the free use of water-meters, has reduced the consumption of water to 38.9 gallons, about two-fifths the American average in our cities. The use of meters is secured by making the water rate to those who put them in about two-thirds of what it is to those who use water without a meter. The expense of providing the meters is small and their inspection costs little.

THE SUPPOSED CANALS ON MARS.—The singular "canals" seen on Mars are explained by M. Fizean on the supposition that the planet had glaciers much larger than those of the earth, and with greater crevasses and movements.

GOOD HEALTH.

Absorption Through the Pores of the Skin.

This subject is very little understood or comprehended by mothers and guardians in its true relation for good or evil to the physical system. Many persons apparently realize that our bodies need little support other than what is swallowed through the throat. Good health, a happy disposition, and even moral character, is dependent in a greater or less degree upon outward influences; much foreign substance is taken in and thrown off by the lymphatics and pores of the skin. We may acquire valuable practical knowledge by the study of physiology, learning how the lungs feed the heart with pure blood by breathing in the pure air and throwing off the impure, but fewer older persons properly realize the necessities and the capacity of the skin which covers the whole body. If the entire surface of the body is washed off daily with pure water only, much clogging substance is removed from the pores of the skin, thus giving renewed strength and tone to the skin to perform its functions, while receiving the exhilarating qualities from the atmosphere. When the stomach and bowels are suffering from intense inflammation, and the patient has become reduced from long absence of food, considerable nutriment may be taken into the system or absorbed through the pores of the skin, if frequent bathing is applied with nourishing preparations. A delicate person may receive great benefit by frequent rubbing with different alkaline preparations—oils and alcohol—the latter of which is always most beneficially used in outward applications. Many a dear little baby has been sent from earth to heaven, when attacked by cholera infantum, by being fed on burnt brandy and other stimulants that burn out the delicate tissues of stomach and brain, when, if pure alcohol with milk or oil had been frequently applied to the surface of the body, the little child might have lived to a ripe old age to bless and comfort humanity. It is much the custom in some foreign countries to rub the entire surface of the body with oil to give elasticity to the muscles and smoothness to the skin. A variety of nutritive preparations may be used with great benefit in the daily bath for young, delicate children, as well as for old persons when the vital resources have become depressed and weakened.

THE HABIT OF EATING MORE THAN WE NEED. Growth and waste and repair go on in a nearly uniform way the whole year through, but the amount of food necessary for these operations or purposes is surprisingly small. The generation of bodily heat requires a most variable quantity of food. In winter, with the temperature of the external air at zero, the temperature of the blood in healthy persons is 98.3 degrees, and when the heat of summer drives the mercury of the thermometer near to or above that mark, the blood still registers 98.3 degrees. The marvelous mechanism by which this uniform blood temperature is maintained at all seasons is not necessary to consider, but it must be evident to every one that the force needed to raise the temperature of the whole body to nearly 100 degrees in winter is no longer needed in summer. The total amount of food needed for repair, for growth and for heating, physiology teaches us, is much less than is generally imagined, and it impresses us with the truth of the great surgeon Abernethy's saying that "one-fourth of what we eat keeps us, the other three-fourths we keep at the peril of our lives." In winter we burn up the surplus food with a limited amount of extra exertion. In summer we get rid of it literally at some extra risk to health, and, of course, to life. We cannot burn it. Our vital furnaces are banked and we worry the most important working organs with the extra exertion of removing what would better never have been taken into the stomach.

THE NEED OF ARM EXERCISE.—Walking on an even surface, the only variety of physical exercise which most business and professional men get in town, is well known to be a poor substitute for arm exertion. The reason is partially plain, since walking is almost automatic and involuntary. The walking mechanism is set in motion, as we would turn an hour-glass, and requires little attention, much less volition and separate discharges of force from the brain surface with each muscular contraction, as is the case with the great majority of arm movements. The arm-user is a higher animal than the leg-user. Arm motions are more nearly associated with mental action than leg movements. A man's lower limbs merely carry his higher centers to his food or work. The latter must be executed with his arms and hands. A third way in which arm exercise benefits the organism is through the nervous system. Whether this is due to an increased supply of richer, purer blood, or whether the continual discharge of motor-impulses in some way stores up another variety of force, we do not know. One thing is certain, the victim of neurasthenia is very seldom an individual who daily uses his arms for muscular work; with this, the limit of bodily mental work is seldom reached.—*Popular Science Monthly*.

MEAT AND STRENGTH.—All the heavy work of the world is not done by men who eat meat. The Roman soldiery, who built such wonderful

roads and carried a weight of armor and baggage that would crush the average farmhand, lived on coarse brown bread and sour wine. They were temperate in diet, regular in exercise. The Spanish peasant works every day and dances half the night, yet eats only his black bread, onion and watermelon. The Smyrna porter eats only a little fruit and some olives, yet he walks off with his load of a hundred pounds. The coolie, fed on rice, is more active and can endure more than the negro fed on fat.

TO COOL A ROOM IN HOT WEATHER.—A correspondent of the *London Carpenter and Builder*, gives a very useful hint as to how to make a room tolerably cool during hot weather. The great cause of heat in a room is, of course, the glass, which, under the sun's rays, will become too hot to hear pressing with the fingers. It is shown that those who cannot enjoy the luxury of an outside sun-blind can extemporize a very good substitute by simply lowering the upper half of the window frame and turning the curtain outside. This not only screens the window, but creates a strong draught between the panes and the linen, and thus absolutely makes the glass cold.

SHORT RESTS.—A week or a fortnight of rest from regular employment has become, in the last few years, a regular custom in all cities or towns of large size. The concentration of a whole year's recreation into 7 or 14 days often produces greater fatigue than would continuous labor. To counteract this tendency to make pleasure an actual burden, the movement for early closing and Saturday half-holidays was brought forward. Short rests and often are what is needed for the general public.

MICROBES NOT ALWAYS INJURIOUS.—The idea that all microbes are injurious to health, says the *Sanitary News*, is a very common one, even among those who pose for well-informed persons. The fact is that they are now believed to play a not unimportant part in the process of digestion and the transformation of food into assimilable form.

MEAT AND CANCER.—Refuting the assertion that meat diet causes cancer, Surgeon-Major Handley reports from India that out of 102 operations for cancer performed at Jeypore since 1880, forty-one were on the persons of meat-eaters and 61 on those of strict vegetarians, who had not known the taste of meat from their births.

CATCH HOLD OF THE DUMB-BELLS.—Ten or fifteen minutes' daily practice with light dumb-bells will do more toward warding off colds, rheumatism and other ills to which humanity is heir in this latitude than all the summer resorts and pharmaceutical preparations in the whole country.—*Cincinnati Times Star*.

VACCINATING FOR YELLOW FEVER.—The physicians of Brazil, it is reported, have been in the habit of vaccinating for yellow fever in the same way as those in this country do for smallpox, and it has proved to be a success.

CODLIVER OIL.—It is said that much of the codliver oil of Russia is adulterated with liquid paraffine, in some cases as much as 50 per cent.

USEFUL INFORMATION.

HOW TO GET BAIT WITHOUT GOING INTO CANADIAN PORTS.—A German chemist proposes to construct an apparatus whereby bait and fish may be preserved fresh for an indefinite period. The process consists of placing the fish in a steel barrel filled with an antiseptic solution in the proportion of three per cent of solution and 97 per cent of water. The barrel is then closed by a tight-fitting lid, the air exhausted by a small air pump, water being forced into the barrel at the same time until a pressure of 60 pounds is obtained. This process was patented in Germany over one year ago, and is known as the Roosen process. Samples of the fish preserved in this way for six months are shown, apparently as good in flavor and otherwise as when first caught. The cost of this preservative process is very small. There are seasons on the Atlantic when the school of herring and spawning is enormous, notably last year in Ipswich bay. If these could be preserved and stored, to be drawn on when needed, the issue between the two countries would not be worth wrangling over. It is the intention of the Fish Commission to make a special effort this year to propagate mackerel.

A POSSIBLE DANGER.—"Rough on Rats" has long been recognized as the name of a useful compound of phosphorus, arsenic and other essentials, by means of which the world has been rid of a vast number of rodents and human foals. It has never hitherto been thought necessary to take any especial precautions about placing it where it would do the most good, or in storing the packages away, except to keep it out of the reach of such small numbers of the human, canine and feline races as we particularly cared to keep with us. Now, however, comes forward a correspondent of *Fire and Water* with the query whether this article, into the composition of which phosphorus enters so largely, may not have been accountable for very many of the fires in dwellings, barns, stores and

buildings of like character, the origin of which has been roughly charged to spontaneous combustion or given up as unaccountable. The idea was suggested to him, he says, by an examination which he recently made of a stable greatly infested by rats, and by finding the poison "rough on rats" freely scattered about in every nook and corner of the building, and in such a manner that had the phosphorus in the stuff become ignited in any one of a dozen places, the wooden floors or walls, dry as tinder, would have been in a blaze at once. This is the first time, we think, that the suggestion has been made, but when one comes to think of it, why is it improbable? No sane man would think of leaving ordinary phosphorus lying around loose in rat-holes, among old rags and inflammable rubbish of all kinds, unless he wanted to start a blaze; yet this is just exactly what is being done day after day with this composition by thousands of persons. Of course, it is possible that the proportions of the different ingredients of the mixture may be such as to preclude any danger of spontaneous or accidental ignition, but would it not be well to have the subject thoroughly investigated?

SEAWEED IN PAPER PULP.—It is said that the strength of paper is materially increased by the employment of seaweeds, which firm with water glutinous liquors. Resin soap and aluminous cake or compound may, if thought desirable, be added. It is also claimed that a very bright surface may be given to paper as follows: A very concentrated cold solution of salt is mixed with dextrine, and a thin coating of the fluid laid on the surface of the paper, by means of a broad soft brush. It is then allowed to dry. The most advantageous salts are sulphate of tin, sulphate of magnesia, and acetate of soda. It is necessary for the paper to have first been sized.

A GREAT SUBMARINE CRAFT.—Col. L. E. Wells of Richmond, Va., is taking steps toward having constructed a powerful steel craft for submarine exploration. The vast strength this vessel will possess will render it available also as a ram for purposes of war. A stock company is about being formed, looking to the building and working of this craft. Col. Wells is in correspondence with a Delaware firm regarding the construction of this new type of sea-going boats. There is no doubt as to the success of the enterprise, as a model constructed some time since worked perfectly, both on and under the surface of the water.

THE NEW FRENCH RIFLE is said to be terribly destructive of life. Experiments made upon dead bodies show that the bullets whiz through the bones and pierce them without fracturing, as is done by the bullets of the "Gras rifle." The wounds, if they may be called so, which are inflicted, are small in their punctures, and consequently very dangerous and difficult to heal. Injuries inflicted at short distances are so considerable that, in the opinion of the surgeons, they would be almost incurable. The discharges of the rifle are unaccompanied by smoke, and the reports are comparatively feeble.

TO EFFECTUALLY STOP UP RAT OR SQUIRREL HOLES.—Soak one or more newspapers, knead them into a pulp, dip the pulp in a suitable solution of oxalic acid. While wet, force the pulp into any crevice or hole made by the mice or rats. Result, a designated retreat, with sore snouts and feet, on the part of the would-be intruders. It should be borne in mind, however, that oxalic acid is a deadly poison.

CATTLE PLAQUE FROM BACTERIA.—Dr. Gamalea and his colleagues of the Bacteriological Station at Odessa, Russia, have become convinced that the cattle plague arises from the presence of bacteria, and that the application of the Pasteur system, under slightly altered conditions, would eventually prove efficacious. Experiments that are about to be made are expected to give positive results.

TO KEEP THE BIRDS FROM FRUIT.—Pans of water placed in fruit and berry patches will keep birds from eating the fruit. An English naturalist claims that the reason birds eat cherries and strawberries is because in the blazing heat they get dreadfully thirsty. If the birds can easily get at water they soon leave off taking the fruit. The experiment is certainly worth trying.

STEEL WIRE MATS are a new article in metallurgical industry. They are made from steel wire, with steel frame and steel braces, all perfectly galvanized, and are wear and weather proof, are self-cleaning, require no shaking, and by the slightest scrape, snow, ice, mud, clay, and water are wiped out of sight.

THE MOST POWERFUL ELECTRIC LIGHT IN THE WORLD is at the St. Catherine's lighthouse, on the southern extremity of the Isle of Wight, on the English coast. The carbon pencils are 2½ inches in diameter, the interval between them one-half inch, and the light developed equal to 60,000 candles.

DEMAGNETIZED HIS WATCH.—It is said that a Long Island physician, finding his watch had become magnetized, inclosed it in a cloth bag and buried it in damp earth, where it remained for three days. Upon digging it up he found it completely demagnetized, and it has not since varied one second.

GREAT GUNS.—In a recent debate on the army appropriation bill in the House of Representatives, Mr. Wheeler said: "I am unalterably opposed to a large army, and I do not know a better way to prevent the necessity for an augmentation of our military force—so important to be avoided—than to keep up with the world on the question of material armament. A gun does not eat rations, wear clothes or draw pay, but it is always on hand for duty, and can easily be moved to the place where it is most needed. There are now mounted upon vessels of foreign navies 129 guns which throw a projectile 10 miles and upward, and the caliber of these guns varies from 12 inches to 17 inches, and they throw projectiles which weigh as high as 2000 pounds. It also appears that there are now afloat in foreign navies 66 guns which throw projectiles weighing from 900 to 1250 pounds a distance of at least 9 miles." It is to be regretted Mr. Wheeler did not mention some of the ships that throw projectiles as he states. We fear it will be difficult to find the vessels.—*Scientific American*.

HIGH PRICE OF LUMBER.—There is much complaint in San Bernardino county at the high price of lumber which prevails there. The price is so high that building improvements are seriously interfered with. A prominent investment banker in that city recently said to a newspaper reporter that he entertained no doubt but that the lumber pool was harming the city to an extent that could only be realized by investigation. He understood that lumber was furnished the companies at Eureka and Humboldt at \$12.50 per thousand, while here the prices ranged up to \$42.50. The cost of freighting the lumber there he understood to be very light. Continuing, the gentleman said that the owner of the property on the northwest corner of Fifth and F streets was delaying the erection of a five-story, granite-front, brick building, for the sole reason that he cannot see the economy in building while lumber remains at the present exorbitant figure. San Bernardino architects make similar complaints.

THE SENATE has added an amendment to the Sundry Civil bill appropriating \$250,000 for a survey of the arid region of the West with a view to its ultimate irrigation and habitation. Major Powell, director of the Geological Survey, estimates that this barren region comprises a million square miles, or more than one-fourth of the whole United States and Territories, and that 300,000 square miles can be economically irrigated and made fertile. It is alleged that corporations are now taking possession of the head-waters of streams, and that settlers are obtaining vested rights which will interfere with any comprehensive plan if the survey is longer delayed.

LOST ON THE DESERT.—News comes from Hiko, 65 miles west of Piche, that Scappaturo, reported lost from the Utah Central surveying party, was found at Quartz Springs. When the party left that place coming eastward, Scappaturo walked ahead, and, sitting down under a tree by the roadside, he went to sleep, allowing the wagons to pass unobserved. He awoke bewildered and walked back to the springs, where he remained five days without food. When found, he was digging out a rabbit from a hole in the side of the hill. He was taken to Hiko, where he is now recovering, though he is still somewhat feebly, as a result, probably, of five days' starvation or possibly an stroke.—*Salt Lake Tribune*.

A SPANISH FLOATING EXPOSITION.—It is reported that a floating commercial exposition is being prepared in Spain for carrying specimens of Spanish manufactures to the principal ports of South America. The Conde de Villana is the name of the ship which is being fitted up as a sort of marine commercial museum. This ship will take the first installment of its cargo at Barcelona, and after proceeding to the other Spanish ports for the same purpose, will set sail for South America. The object of the floating exposition is to secure new markets, to prevent the pirating of Spanish trade-marks, and to put a stop to Spain's paying tribute to England in the share of exchange in her trade with South America.

THE TRUCKEE REPUBLICAN says: "James McDonald told a reporter the ice shipments were immense. Boca is supplying most of the ice now, the houses at Martis Creek and Caba being empty. About 3000 tons have been shipped from Prosser Creek. As soon as the Boca houses are empty the Prosser Creek Co. will supply the market. There will be about 8000 tons of ice carried over for next year, was Mr. McDonald's statement. The shipments are exceeding those of last year and anticipating another increase next season. The Boca Ice Co. is erecting another house with a storage capacity of 8000 tons."

A MECHANICAL SCARECROW has been invented. This new invention represents a man of "sportsmanlike" appearance, standing with gun in hand, ready to fire at the first intruder. The arm holding the gun is made to move by clockwork, which is inclosed in a strong iron box at its feet, and at a proper elevation it fires a shot louder than an ordinary gun. After the report the arm lowers. The mechanism can be regulated at the owner's pleasure by a regulator like a clock, and only requires to be wound up once a day.

SAN FRANCISCO

Saturday Morning, Sept. 8, 1888.

TABLE OF CONTENTS.

EDITORIALS.—"Westward the Star of Empire Takes its Way"; An Improved Mining Hoist; Work at the Mining Bureau, 153. Passing Events; Where Many of Our Youth Should Look for Employment; Chronology of the Marshall Sutter Gold Find, 160. Rules for Blasting; Increasing Importance of Silver; Wood Pavement in Europe, 161. A Gun to Shoot Twenty-five Miles; "Hazing" That is Always the Way; Decline of the K. of L.; Wine and Raisin Product of 1883, 158.

ILLUSTRATIONS.—Improved Mining Hoist Manufactured by the Fulton Iron Works, 153.

MISCELLANEOUS.—The Russell Process, 154. The Remarkable Colliery in Japan; Englishmen and Petroleum; Improved Ten-inch Four-Sided Molder, 155.

MECHANICAL PROGRESS.—Construction of Steam Cylinders; Extending and Improving Blast Furnaces; The Locomotive Engineer; A New Steel Casting Process; New Shaping Tool; Heavy Rails; Preventing Accidents from Machinery; Shipping Aluminum to England, 159.

SCIENTIFIC PROGRESS.—A Visit to the Past; Progress in the Application of Electricity; The Nature Created by Science; Character of Nitrogen in Fertilizers; Saving by the Use of Gas Meters; The Supposed Canals of Mars, 158.

GOOD HEALTH.—Absorption Through the Pores of the Skin; The Habit of Eating more than we Need; The Need of Arm Exercise; Meat and Strength; To Cool a Room in Hot Weather; Short Rests; Microbes Not Always Injurious; Meat and Cancer; Catch Hold of the Dumb Bells; Vaccinating for Yellow Fever; Codliver Oil, 159.

USEFUL INFORMATION.—How to Get Bait Without Going into Canadian Ports; A Possible Danger; Seaweed in Paper Pulp; A Great Submarine Craft; The New French Rifle; To Effectually Stop Up Rat or Squirrel Holes; Cattle Plague from Bacteria; To Keep the Birds from Fruit; Demagnetized His Watch; Great Guns, 159.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 160-61. **MINING STOCK MARKET.**—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 164.

OUR LUMBER INTERESTS.—Forestry Experiments in New England; The Duty on Lumber; Shingles Short in Number; Etc., 174.

THE BUILDER.—The Philosophy of Architecture; To Finish a Brick Wall; Fire-proof Building Material; Steel Plates for Houses; Building in the City, 174.

STEAM BOILER NOTES.—Progress in Steam Boiler Manufacture; Compound Engines; Strange Things About Steam; Steam Jacketing; Stop Valves; Defect in Boiler Tubes; Time to Quit; High-Speed Engines, 174, 175.

SHOP NOTES.—The Purchase and Use of Pulleys; The Safety Limit for Belting; How to Dispose of Old Tools; Cleaning Greasy Machinery; Shop Dust; Crap-ite in Making up Joints; For Sharpening Tools; The Tendency to Use Too Narrow Bits; To Keep Machinery from Rusting; To Solve a Joint, 174.

FLOUR MILL NOTES.—A Southern California Wheat Ranch; Milling Power; "Fancy Milling"; First American Mill in New Zealand; European Wheat; Wheat Burned, 172-73.

COTTON AND WOOL.—Manufacture of Cotton Fiber; The Cotton Corner; Substitution of Mulberry Fiber for Cotton; Mysterious Origin of Fires in Cotton; Utah Wool Mills; Wool Scouring Works for Denver; A Manufacturer's Opinion; The Sheep Interest in Oregon; Wool in Australia, 173.

Passing Events.

The dry, hot weather continues, and in some localities has been intensified, causing an entire drying up of the springs and streams to the great detriment of the millmen and stock-raisers. The present drouth is reported more severe in some parts of the mining regions than ever before. *Per contra*, they have at some points in Arizona had an excess of rain, the

water falling in such torrents as to cause no little inconvenience and some damage.

In California the rivers have fallen to an unusually low stage, causing a shortage of water to the hydraulic miners, but greatly favoring those engaged in river-bed operations, some of which are proving successful beyond precedent.

To the 500 idle miners on the Comstock, another hundred has lately been added at Seligman, Central Nevada, with smaller complements in other camps in that part of the State, the water famine being the principal cause of so many miners being out of employment.

Were not this department confined strictly to mining matters, it might here be remarked that the county fairs are now in full blast all over the State, with many large squashes and much of horse-racing, but a reported falling off in the other forms of gambling.

Where Many of Our Youth Should Look for Employment.

We had last week something to say in these columns about the importance of providing suitable work for the oncoming generation. For want of space we did not then sufficiently enlarge upon the value of our mines as a suitable field for the employment of this class of our population. In the much attention that is being paid to agricultural pursuits, and in the preference shown by our young men for the so-called learned professions, there is a danger that our mineral resources as a means of affording suitable and profitable employment for the young will be undervalued if not wholly overlooked. That this is likely to happen is denoted by the extent to which the mining industry has come to be ignored by the newspaper press of the country. There is not a paper issued in this city, nor yet anywhere in the State, but devotes twice as much space to horse-racing as to the subject of mining. Even the contents of the baseball clubs are more written about than the gold mines. And yet the latter offer better opportunities for the young man to make a fortune than farming or either of the learned professions—immeasurably better than jockeying, ball-playing, or other fashionable diversion.

It has come to be altogether too much the fashion to regard our gold mines as exhausted, and mining as a dead industry in California. In the popular mind the business has been relegated to the dim and distant past. By the majority it is regarded as a sort of hy-play, being enacted somewhere in the mountains, they don't know just where. There is a tradition that it once reached here very respectable proportions, but they cannot vouch for its authenticity. To such a lowly estate has this grand and beneficent industry fallen in the estimation of the ill informed.

Look the world over, search through all lands, and where shall we find another pursuit that pays like gold mining in this State? There is none. Nor is the field narrow or by any means fully occupied. The area of our auriferous territory is vast and much of it still vacant, and for going out into this rich and illimitable domain it is time we should be fitting great numbers of our youth, providing for them such elementary instruction as will prepare them for engaging in the business of mining to advantage.

Already efforts are being made by communities possessing not a tithe of our mineral wealth to establish institutions for preparing the young for successful miners, that end being in some cases reached through the common schools. In Australia a movement of this kind some time since set on foot has been attended with the most happy results, the effort there including a school for the instruction of prospectors and adult miners as well as the youthful population. With us the plan should be engrafted on the common-school system, with provision for instructing pupils who intend to become miners in the branches especially adapted to fit them for that business, such as geology and mineralogy, with specimens of earths, rocks, ores, etc., illustrative of the subject. Here the rudiments of metallurgy and assaying with the use of the blow-pipe should be taught, together with the application of those simpler tests to which the prospector may have recourse for the determination of minerals. The mode of occurrence of metals and minerals in veins and other forms of deposits might be pointed out—also the best methods for searching after and exploiting the same. With the composition and use of explosives, the employ-

ment of power drills, pumps and other mechanisms and appliances used in mining, the pupil might be so familiarized that he would, when he came to enter the field, find their practical application comparatively easy.

Measures for securing the objects here indicated and for otherwise aiding and encouraging of boys and young men to fit themselves for miners should at once be taken by those who take an interest in the welfare of this class or have the good of the commonwealth at heart. The professions, legal, medical, educational and clerical, are already full to excess. To rear a boy for either of these callings so ill paid and overcrowded where there is open to him a life of sure rewards and manly independence is little short of criminal. Turning to mercantile, manufacturing and mechanical pursuits, the outlook is not much better, nor does even the life of the honest Granger with its anxieties, its uncertainties and its drudgery offer to the young man much that is more inviting.

Was ever such fatuity shown as this deep concern for the future of the young coupled with so much of indifference to the best opening extant for their profitable employment? We know how fierce is the competition that makes success all but impossible in every other line of business, and affect to deplore the absence of industries suitable for our boys, and yet fail to make available these resources so close at hand and so well adapted to supply this much-felt want.

Aside from mere industrial and economic considerations, there are others why our growing young men should be sent to labor in our gold-fields. Mining is a pursuit well suited to develop a sturdy and manly character, no calling having a tendency to bring into play the better impulses of our kind. There is nowhere to be found a more self-reliant, generous or energetic class than the men reared in the mines. Even the wage-earners fail not on occasion to show themselves capable of the most daring and heroic acts. Their self-abnegation and indifference to danger in the hour of extreme peril does honor not only to the guild, but to human nature itself.

There is in these lackadaisical times—these days of dolls, dudes and men-milliners—such fearful and growing dearth of genuine manhood as threatens, unless arrested, the early extinction of all that goes to form a brave and hardy race. As the merchant marine has proved a good school for producing efficient sailors, so may the mines be made a grand nursery for rearing brave men and model citizens.

RUSSIAN OIL WELLS.—The output of Russian oil wells exceeds anything yet produced in the United States. The flow from a single well at Baku has averaged 32,000 gallons per day for 12 years, and the flow has not diminished. There is a large number of other wells which yield nearly as much and some of them more than this. One exceeds it in present flow. It has yielded 40,000 gallons per day for six years. Another well has the following record: For 43 days it yielded 850,000 gallons per day; for 30 days the yield was 225,000 gallons per day; for 11 days the yield was 180,000 per day. This well, after yielding 125,000,000 gallons (500,000 tons) in 115 days, was plugged, and its supply stopped for future use. Five hundred wells have been sunk in the Baku districts, two hundred of which, irrespective of the enormous fountains, are now producing 500,000,000 gallons of oil every year, and American operators believe that this flow could be increased ten-fold. The Rothschilds are said to control a large percentage of the producing and refining business.

The Sacramento Record-Union of August 29th says: George Hofmeister, one of the Commissioners of the Marshall monument, visited Coloma one day last week. He says the foundation is nearly completed, and the work is progressing finely. They will commence putting up the granite column this week.

In the old Perehaker claim at Magalla, Butte county, a drift has been run into an ancient river-bed that has free gold as coarse as gooseberries.

Several oil companies have been organized in Wyoming. That is the coming oil paradise. The surface prospects astound old Pennsylvania oil experts.

Chronology of the Marshall-Sutter Gold Find.

Touching the discovery of gold in California, there has appeared from time to time more than one person claiming the honor of that event, or at least seeking to share that honor with Marshall and Sutter. The date of that discovery has not, however, until recently, been called in question, the 19th of January, 1848, as given by Marshall and his associates, having generally been accepted as the day on which the discovery happened.

But now comes Henry W. Bigler and changes the date of that ever-memorable occurrence from the 19th to the 24th day of that month, as established by an entry made in a diary kept by him during a portion of the year 1847-8. Bigler was a member of the Mormon battalion, which enlisted in the service of the United States in Missouri, June, 1846. They were engaged for one year, and were to go to California for the purpose of aiding in the conquest of that country. This battalion, which numbered 500 men, was under the command of Lieut.-Col. Cooke. Passing through the Indian Territory, New Mexico and Arizona, the command entered California early in 1847, crossing the Colorado near the present site of Fort Yuma. The object of this journey to California having been accomplished, the battalion was mustered out at Los Angeles on the 16th day of July of that year. Some of the members after their discharge proceeded at once to Salt Lake, the major part of them either re-enlisting or scattering through the country in search of work.

Bigler going north was employed by Captain Sutter, and on the 27th day of September went with Marshall to assist in putting up the saw-mill at Coloma, and was there when the first piece of gold was picked up, which he says occurred on the 24th day of January, 1848. Now, according to all previous authorities, Sutter, Marshall and Weinmer included, this happened on the 19th day of that month, and not on the 24th, as Bigler has it. This is the first time that the date of this occurrence, as given by Marshall and others present at the time, has been called in question, and it is a little strange that there should appear such a discrepancy in the date given by parties on the ground, their opportunities for fixing it correctly having been, to all appearance, equally good.

As Bigler kept a sort of journal, a thing no one else pretends to have done, it would, at first glance, seem as if his account of the incident would more likely than any other be correct. But this journal was not exactly a diary, the events recorded in it not having been entered day by day, but at irregular intervals, as the following entries made at the time of the gold discovery show:

"January 1, 1848.—All hands worked on the mill-dam, which is built of brush."

"Sunday, January 23d.—We have had much rain of late, and last week we built a cabin near the mill. To-day four of us moved into it."

"January 24th.—This day some kind of metal that looks like gold was found in the tail-race."

"Sunday, January 30th.—Clear, and has been all the week. Our metal has been tried, and proved to be gold. It is thought to be rich. We have picked up more than a hundred dollars' worth last week."

Now it will be seen that these observations are not registered daily, but at irregular and in some instances at long intervals, and it might well have happened that the remark about some kind of metal having been found January 24th, though entered on that day, referred to an event that happened several days before; or, what is more likely, the day here mentioned was that on which Bigler first heard of the gold find, as both Marshall and Weinmer tell us they kept that fact to themselves for some days after it occurred, well knowing that if it got out the men employed on the mill would knock off work and go to gold-digging.

With this explanation, which seems altogether reasonable, it is easy to see how our chronicler came to fall into such chronological error. That Bigler made no willful statement we may well believe, as he was a man of more than average intelligence and undoubted truthfulness. The 19th day of January, 1848, must, we conclude, continue to stand as the anniversary of the grand gold discovery in California, the entry in the Bigler diary to the contrary notwithstanding.

Rules for Blasting.

In recent numbers of the PRESS we have given some extracts and engravings from Drinker's fine work on "Tunneling, Explosive Compounds and Rock Drills," and here continue the subject:

If $a f$ (Fig. 1) represent a hole parallel to the open face $e b$, the line of least resistance, $e d$, will indicate the general throw of the shot. It will not be necessary to bore the hole $a f$ to the depth $e b$, for it may be assumed in most cases that a curve will be found in the general direction $f b$. Similarly we may presume, under favorable circumstances, that the blast will also break in the direction $f g$. The shot $a f$ would have been set very favorably if there ran from g a crack about parallel to the hole, and from b another perpendicular to it.

If, as in Fig. 2, we assume an existing lower cut in the cavity at d , we then might take $b d$ as the line of least resistance, and to obtain a maximum would extend it to three quarters of the depth of the hole—i. e., set the hole still more obliquely than shown in the figure, for in this case the deeper the hole and the more the rock to be blasted bulges, the greater will be the result of the shot.

The shot $a b$ (Fig. 3) may be considered as an unfavorable case, provided the hole cannot be set above a , for now the shot can only break approximately in the line $a b f$, as if the line of least resistance were sought in a line drawn perpendicular to the hole it would be nearly vertical; further, the shot cannot act as far as d (supposing the rock to be solid), for the distance $c d$ is longer than the hole $a b$. A hole set more obliquely at a and bored to a greater depth would be also unfavorable, for the mass of the portion $f d$ would be too thick, and the rock being hollowed at f , a line drawn from f perpendicular to the hole would then repre-

shots should be set perpendicular to the face of the seams.

The portion of the hole holding the powder ($b c$, Fig. 4.) should be located within the whole rock. This rule, of course, only holds in rock where the strata are thicker than the depth of the powder charge in the hole. If the charge intersect a stratification-bed there will, in general, be a waste of force. Therefore a short-

of course, theoretically, and generally practically, the most unfavorably located.

(b) If the strata dip toward the face, hence toward the miner, the breaking-in is started at the roof (Fig. 5). This case is the most favorable one, as the miner may then easily cut the seams perpendicular to the strata, as in Fig. 4, and the drilling is downward.

(c) If the strata dip from the face (Fig. 6)

FIG. 1.

FIG. 2.

FIG. 3.

FIG. 4.

FIG. 5.

FIG. 6.

LOCATION OF DRILL HOLES FOR BLASTING ROCK.

sent the line of least resistance, and the shot would probably act only to the point f , leaving $f d$ standing. Another very important rule supplementing the preceding one is:

Clefts and fissures and lines of stratification in the rock must be carefully used to advantage.

Such separation faces always represent in a minor sense open or clear faces, and where they exist back of or beyond the hole, we must presume that the shot will act not only outward, but inward, and lines of least resistance will then have to be considered both ways. Fig. 4 may be taken as an example. The shot will probably act beyond the bottom c of the hole, and the distance $c d$ to the next stratification-bed may be taken as the first line of least resistance; and an effect thence toward the exterior (perpendicular to $a c$) may be taken as the second. What in such a case may be estimated as the extreme limit of $c d$ and $d e$ would have to be found by trials. In these cases, of course, the distance $d e$ will be over the average rule of three-quarters $a c$.

When irregular clefts and cross-fissures occur, the question becomes more complicated, and the effect is generally directed to obtaining the largest possible wedges.

In general, we may say, as to blasting in regularly stratified rock, that, in regular seams, the

fissured rock, (i. e., one naturally broken by short clefts, etc.) or one much laminated, though it gives more faces for the powder to act on again, is ultimately less favorable material, in many cases, than more solid material; therefore,

Short-fissured, laminated or slaty rock should not be drilled, if possible, in the direction of the laminae, but, according to the circumstances, in an oblique or normal direction to them.

Should a hole be located in a rock divided into thin laminae, the effect of the shot would possibly only extend to the adjoining beds, and a small wedge might be thrown out; but if the shot be set in a line perpendicular or oblique to the beds, though undoubtedly the charge would be cut by the layers, still a greater effect would probably be obtained. The volume of the blasted body, on an average, is as the cube of the depth of the hole; it is a self-evident deduction that costly preliminary shallow hole work should be avoided as much as possible, and the main masses be thrown by deep-set shots.

Therefore, not only should each shot be set so as to clear a bearing for the following shots, but also, the proper volume should be blasted away.

(a) The first shot at the face of a drift is,

the breaking-in must be started at the bottom, and succeeding shots are drilled either under an angle steeper than the dip of the strata, or if the strata be thick, the shots may be drilled parallel to the stratification beds.

(d) Cases may occur where the breaking in may be located advantageously at the middle of the face.

(e) If the stratification be vertical, and parallel to the line of the drift, the breaking-in is generally made at the side.

Short-fissured or very tough rock requires shallow holes; coarse-fissured, moderately tough rock takes holes of the average depth; and brittle and solid rock works well with deep holes. In tough rock wide holes, and in brittle rock narrow holes, are the more economical. It should be noted that firm, brittle rock may be distinguished by the rebound of the hammer; it drills hard, but breaks easily. Examples are: Trap, granite, gneiss, syenite, etc. Firm, tough rock does not cause the hammer to rebound so violently, leaves a white streak when scratched with steel, drills easy, but breaks hard. Examples are: Limestone, porphyry, quartzose lodes, etc.

In driving a heading, particular care should be taken that unnecessary cost in flushing the clear profile does not arise. Large protuber-

ances and cavities must be avoided, and particular care in this respect should be paid in tunneling—in taking out the bottom of the bench that there be not a large amount of trimming left to be subsequently done in clearing the normal profile, for such work not only is very tedious, causing delay, but is costly. For this reason holes located near the sides or roof should receive especial care.

INCREASING IMPORTANCE OF SILVER—It appears from statistics that but a short time since the seven principal banks of Europe held, in round numbers, \$587,000,000 in gold and the exceedingly large proportionate amount of \$146,000,000 in silver. Omitting the Bank of England, in all the other banks the gold was only \$40,000,000 in excess of the silver. Silver is accumulating in Europe much faster than gold. The Bank of France during the past year has reduced its stock of gold by over \$13,000,000, and increased its silver by nearly \$8,000,000. These facts are of much interest to this coast in showing that silver money is increasing in importance in Europe, while it constitutes one half of the metallic reserves, and probably holds much more than that proportion in the actual metallic circulating medium. The coin balances in the smaller banks throughout Europe would doubtless show a much larger proportion of silver than the large representative banks, as given above. In these figures the single silver standard of Russia is not taken into account. It may be regarded as an enigma which no fellow can find out, or at least as a fact for which no good reason can be given, that the largest silver-producing country in the world should stand out as the most pronounced in its advocacy of gold as against silver.

WOOD PAVEMENTS IN EUROPE.—Wood pavements have met with greater success in Europe

than in America, because they are laid upon a foundation of concrete, and receive more attention in the way of maintenance than is given them here. American yellow pine, owing to its hardness and resinous quality, has been the favorite wood in Berlin and Hamburg. A report from Berlin states that the Frederick's bridge was paved in March, 1879, with yellow pine, and is still in a good condition, while the approaches, paved with granite blocks, have twice since required repaving. The Opera platz in front of the Emperor's palace was paved in 1882 partly with yellow pine and cypress at the point where the traffic is greatest. At other points stone blocks were used, and were laid at the same time. To day the area having the wood pavement is the one which is best preserved. So it seems that Europeans prefer to use wood rather than stone for street pavements even when they have to come to America for it.

REPORTS have been received from the Salmon River, Idaho, mining country, of a valuable discovery of gray copper. One ledge of 18 feet is attracting renewed attention in that district.

NUMEROUS prospectors are hunting ledges along Klamath river, on both sides, especially in the Siskiyou mountain foothills, near the Oregon boundary.

A Gun to Shoot Twenty-five Miles.

The subject of improved explosives and guns still continues to attract much attention in military as well as in other circles. Reference has already been made to large guns that have recently been cast at Pittsburg, calculated for extraordinary work, and we now refer to the character of the explosive to be used, which is known as emmensite.

This explosive appears to be absolutely safe to handle, as will be readily inferred from what follows. It can be used in fire-arms, small or large. It burns slowly when ignited. It can be granulated in any size and is very cheap. At a recent exhibition before a company of experts, near Philadelphia, the inventor crushed a lump of the powder in a stone-crusher. A small cartridge was loaded with the powder, and the hall was shot with a pistol through a one eighth-inch iron plate. Four cartridges, containing in all three pounds of emmensite, were placed in holes four feet deep, drilled into a mass of rock. The cartridges were exploded by electricity, and the rock was broken into pieces small enough to be shoveled away. The amount of broken rock was estimated at 35 tons.

A dynamite cartridge, placed upon a post in a field, exploded when struck by a bullet from a rifle, while an emmensite cartridge was merely knocked from the post. Cartridges of dynamite, explosive gelatine and emmensite were successively exploded on iron plates suspended by threads at the corners. The effect of the emmensite was to blow a large hole through the plate, while the same quantity of the other explosives merely bent the plates.

Trial was then made with Springfield rifles. The distance was 100 yards, and the target consisted of five boards, one-and-three-quarter inches thick, about three inches apart, and backed by an iron plate. With a cartridge containing 70 grains of gunpowder, the ball, which penetrated the farthest, struck the fifth board, while the two emmensite balls, driven by 15 grains of powder, pierced all the boards and were flattened against the iron plate.

The availability of the explosive for submarine blasting was shown by immersing emmensite coated with paraffine in a barrel, and exploding it by electricity. A lump of emmensite, thrown into a barrel of water while burning, continued to burn almost to the last grain. Dr. Emmens exhibited a multi-charge accelerating cartridge of his invention, which may be used in any size of gun.

Dr. Emmens estimates that, with a gun 40 feet long, a range of 27 miles would be obtained. The Pittsburg Steel Casting Company is casting for him a three-inch gun, seven and one-half feet long, which is expected to throw a 25-pound projectile six or seven miles.

"HAZING."—A cotemporary well says: The brutal and cowardly custom of "hazing" as practiced at the Naval Academy has been dealt with exactly right by the authorities. Not only has common decency been outraged, but young men wearing the uniform of the United States have been guilty of conduct, intended to be a practical joke, which was as nasty as it was possible for the dirty minded cads to conceive of, who perpetrated it upon younger cadets whose youth should have protected them from outrage and insult. If the cadets at Annapolis cannot conduct themselves like gentlemen while in the service, they should be made to give way to other young men who have had proper home training and discipline to fit them for reaping the advantages of the education afforded, and are sufficiently well bred to conduct themselves always with propriety. The same may be said of all our colleges where this disgusting custom prevails. The management of our own State University at Berkeley has set a good example, and it has been quietly acquiesced in by the students.

THAT IS ALWAYS THE WAY.—It is turning out to be with natural gas as it is with almost every other natural product. Those who have been able to secure the ground which produces it, and the franchises for piping it into the cities where it is to be used, are beginning to squeeze the people who use it, and measures are being taken to see if there is any relief to be had. In Allegheny, Pa., numerous meetings have been held on the subject, and it is proposed to take the matter into the courts, which looks like a case of locking the stable after the

stealing of the horse. It is said that the Rothschilds have secured a controlling interest in the Russian oil wells, which are already producing more oil than all the wells in this country. All the "big things" of this world seem to be centering into the hands of a favored few.

Decline of the K. of L.

A Pittsburg correspondent of the Boston Herald, of a late date, writes as follows: The coming general assembly of the Knights of Labor is causing considerable conjecture as to whether there has been a large decline in the membership of the Order since the last annual convention. Various reports have been circulated about a decrease in the membership, which have been promptly denied by the representative members of the Order. One of the prominent members, who is well known not only in this city but throughout the country, when asked for as nearly as possible the total membership, said: "It seems incredible, but, if a truthful answer is given, the total membership of the Knights of Labor to-day does not exceed 150,000. The talk of about a half million members or more is a gross exaggeration. I have made it a point to inform myself on this question, and the result is that, as I said, there are not over 150,000 of a total membership in the country. The decline since the last general assembly, a year ago, has been distributed over the entire country.

"Take the Pittsburg district, for instance. A year ago the membership was 11,500, and four delegates were elected to the general assembly. This year only two delegates were chosen, and the total membership has fallen to a trifle over 4000. The same can be said of district and national assemblies throughout the country. Take the celebrated No. 49 of New York, for instance. Its membership has decreased from 81,000 to 10,000. The membership of the Massachusetts Assembly, No. 30, dwindled to such a low figure that, to keep up appearances, they consolidated with another district in that State. It is well known that Cincinnati Assembly, No. 48, from a large membership has dwindled down to about nothing. These are but examples of a decline in membership everywhere. There is another noticeable fact, and that is, that all the delegates that have, thus far, been elected to the General Assembly, are Powderly men. There is also a scheme afloat to inflate different districts, by which they will send more delegates than they are really entitled to. I understand that there is now a movement to inflate District Assembly, No. 3, of this city, by which one more delegate can be elected, making three from here. This was done at the last assembly." Another equally prominent Knight of Labor, when asked about the statement, said he believed it was true that the total membership of the Order did not exceed 150,000. He attributed the great decline to a general apathy of the members. He denied, however, that there had been, or would be, any inflation in the different districts to secure additional delegates favorable to certain leaders in the Order.

FROM the Mountain Echo, Angels, Calaveras county: Most of the mines in the vicinity of Mokelumne Hill have closed down for lack of water. Ore from the Whittle mine, at Albany Flat, is being crushed in the Confidence mill, in this town. The hoisting works at the Utica mine, in this town, are said to be five feet higher than any other works of the kind in the State. The gentlemen composing the English company who have contracted for the purchase of the Stevenot mines at Carson Hill, near this town, arrived in Angels last Monday.

PERSIAN CARPET WEAVING has heretofore been in a large measure a secret. It is now reported that a native of Finland, named Runen, was sent two years ago by the Government to try to discover the art of Persian carpet-weaving. He finally obtained employment in a small factory in Smyrna, where he acquired the desired information and made a design of the loom. A Persian carpet factory has now been established in Finland and great results are expected.

It is said that by a new process aluminum is being produced at Newport, Ky., at a cost of little more than copper. It has heretofore cost \$20,000 per ton to manufacture it. If the news is really true, it means a revolution indeed.

Wine and Raisin Product of 1888.

Clarence J. Wetmore, secretary of the Viticultural Commission, has submitted the reports received by him from different growers in the several wine-producing counties, and they are of great interest to the grower and maker, as they give reliable data to base the estimates of the yield for the year. The damage from frost has been confined to Sonoma county, where it ranged from two to five per cent, the damage from coulure far exceeding it, and being as high as 25 per cent in some localities.

Mr. Wetmore gives a summary of the reports and a few remarks, which are appended below. The yield by counties:

	Gallons.
Napa.....	3,500,000
Sonoma.....	2,750,000
Alameda.....	1,400,000
Contra Costa.....	250,000
Santa Clara.....	2,500,000
Santa Cruz.....	300,000
San Joaquin.....	400,000
Merced.....	30,000
Fresno.....	2,300,000
Los Angeles and South.....	3,500,000
Sacramento and North.....	2,500,000
Other counties.....	1,500,000
Total.....	20,330,000

"Of this amount at least 4,000,000 to 5,000,000 gallons will be distilled, leaving from 16,000,000 to 17,000,000 gallons of sweet and dry wines. The total production as given above may be lessened considerably if the present hot weather keeps up. A great many parties have signified their intention of drying their wine grapes. How much this will reduce the wine yield I am unable to say. The early ripening of the grapes will facilitate the drying of them, and no doubt a great many carloads will be dried. The must-condensing machine at Geyersville, Sonoma county, will also be run again this year, which will help to reduce the wine yield of Sonoma county.

"From the reports received it will be seen that white wine grapes will be short, while red wine grapes will be a good crop, especially Zinfandels. Of table grapes, Muscats and Tokays will not be a heavy crop.

"The reports concerning the raisin production are not full, but from what were received I would place the raisin production at 1,000,000 to 1,100,000 boxes."

"Why Mining has not Quite Kept Up."

EDITORS PRESS.—Your editorial of August 25th, under the above heading, is well worthy of perusal by the entire mining community.

Why mining has not kept up with improvements in other industries is simply because that of all sticklers for old things, the miner excels. Any one presenting a new device or method for reducing, amalgamating or concentrating ores, is derided by his fellow-miners, and at once loses caste as a "practical" miner, and this simply because he presumes to present new ideas. Why, the mechanical and scientific world only move ahead on new ideas.

You say, "It is felt we ought to save the precious metals more closely." Certainly we ought to do so, for the mills in this State do not, on an average, save 40 per cent of the precious metals the ores worked by them are known to contain, and this explains why so many of the mills put up here have proved partial or total failures. It is true some of these mills save as high as 70 per cent of the gold, but where this is the case it is due to the employment of improved modes and mechanisms, chiefly concentrators and amalgamators.

It is time the mining community should give more attention to this matter, and instead of scoffing at, extend aid and encouragement to men of advanced ideas. The least they could do would be to give any device brought to their notice a fair trial. As you say, vast advantages may yet come to this industry through discoveries remaining to be made in electrical as well as in mechanical and metallurgical science. Those interested in mining should therefore wake up, and this industry be forced to keep pace with the advancements made in the other departments of human knowledge and human endeavor.

Could a fair percentage of the gold contained in our ores be saved, this branch of mining, now that labor and all the other factors of production have been so much cheapened, would become not only one of the most extensive, but also one of the best paying industries in the State.

Grass Valley, Cal., Aug. 28. BOSTON.

THE Fulton Iron Works has signed a contract with the San Joaquin Improvement Company for a new stern-wheel boat for the Stockton trade. She will be 205 feet long, with compound condensing engine, high-pressure cylinder 22 inches in diameter, and low-pressure 40, both 8-inch stroke, showing about 600 horse power. The Fulton Works also made a contract with the Wilmington Transportation Company for a new passenger boat to run from Wilmington and San Pedro to the Catalina islands. This will be the fourth boat built by this company for that line.

FLOUR MILL NOTES.

A Southern California Wheat Ranch.

With a view of ascertaining something in relation to the amount and quality of wheat and barley grown, marketed and manufactured in the vicinity of Los Angeles, a Los Angeles Express reporter was recently detailed to call upon Mr. Van Nuys, superintendent of the Los Angeles Fanning and Milling Co. Some samples of white wheat from the firm's San Fernando valley ranches were poured into a small hopper, beneath which hung a pint measure, and when this ran full and was stroked off even, it was suspended to a beam with a sliding weight indicating what proportion this quantity bore to a bushel. The first sample, a good shipping grain, indicated 59½ pounds to the bushel, and the second 61 pounds, the two samples coming from two separate ranches in the valley.

Being asked as to the quality and yield of wheat and barley on the company's ranches, the reply was made that both were good, wheat on one of the company's 2000 acre fields averaging over 31 bushels to the acre, while the entire crop on their 25,000 acres would exceed 25 bushels to the acre, while the weight would average as indicated by the tests first made, some going as high as 62 pounds.

The milling capacity is 400 barrels per day, remarked Mr. Van Nuys, and unless the crop on our ranches should fall short, it would require about all our time to grind what we raise.

A little figuring enabled the reporter to demonstrate that at the rate of product named there would be \$7,500,000 pounds of wheat, which, requiring about 300 pounds to the barrel of flour, would indicate about 125,000 barrels, and this divided by the capacity of the mill—400 barrels per day—would occupy all the working days of the year in grinding up what the company's ranches produce. The reflection was made as to what the ordinary Eastern farmer would think of a report of this kind, and probably remark, on hearing it, that it was "a California lie."

Questioned as to the market for all this flour, reply was given that a large proportion of it was sent to Arizona and Texas, and, owing to the limited acreage sown this year, the demand is about up to the supply, with none left in this county for export.

When asked regarding the barley crop of the company, Mr. Van Nuys said it reached over 60,000 bushels, or 30,000 sacks of from 100 to 105 pounds per sack. The yield would show an average of 40 bushels per acre, a large proportion of which is shipped to Arizona, the price being from 75 to 77½ cents for No. 1 feed per 100 pounds. "To run the company's San Fernando valley ranch," said Mr. Van Nuys, "there are required at this season of the year over 300 men, 600 horses and mules. They also employ quite a number of teams outside in the busy season. In the winter the number of hands is reduced to about 125. In harvest-time we run some 20 heading machines, and the wheat and barley are carried direct to the separators (threshers), of which there are five, run by steam-power. When the day's work is done all the grain that has been cut is found in sacks ready for transportation. There is no time or need for stacking and sweating, as is the practice in the Eastern States."

Flour is made at this mill by a dozen or more patent roller-process machines, while the old-fashioned stone burrs are run on corn, and a separate machine used for rolling barley for horse and cattle feed. A large barley storage and grinding-room has been carried up from two to four stories between the mill proper and the new elevator, which is four stories high and contains 15 compartments. It is the only grain and storage elevator in Southern California, and there is but one other—Starr's, at Port Costa—in the State.

MILLING POWER.—A technical exchange, Power and Transmission, says, in respect to horse-power required for milling: "It ought to take about 40 horse power to make 100 barrels of flour per 24 hours. This, if steam is used, will require the evaporation of from 15 to 40 pounds of water per hour per horse-power, or from 1000 to 1600 pounds of water per hour—say 24,000 to 39,400 pounds of water for the 100 barrels of flour. This will be from 240 to 384 pounds of water per barrel of flour. The boiler will require from one-fifth to one-tenth pound of coal per pound of water, so that if the water required is only 240 pounds per barrel of flour, the coal required may range from 24 pounds up to 48 pounds per barrel of flour. If 384 pounds of water are required per barrel of flour, then the coal required may run from 38.4 pounds per barrel up to 76.8. So you have the extreme of 24 pounds and 76.8 pounds of coal, the maximum being about three times the minimum."

"FANCY MILLING," says the Chronicle, as some flour-millers call their grinding of those food products in which fine white flour has no part, is being carried on in this city to a greater extent than ever before, and the rapidity of the increase in this direction is very marked. There are now made here annually fully 1000 tons of buckwheat and rye flour, 3000 tons of cornmeal and farina, 3500 tons of oatmeal and rolled oats, 1000 tons of cracked wheat, 6000 tons of graham flour, 2000 tons of cracked corn and 600 tons of pearl barley. Local millers who make specialties of this class of products

say that they have no occasion to complain at the state of trade and that there is a good outlook for the future. While bread consumers are not turning in any great numbers from the staff of life, as represented by the wheaten loaf, it is a noticeable fact that the present tendency is toward a heavier consumption of "fancy cereals." The millers now grind out immense quantities of graham flour and oatmeal for the use of the local bakers and cracker-makers, the latter making more oatmeal wafers and fancy graham biscuit than could possibly have found a market here a year ago. It is estimated that there are now nearly 200 men and boys employed in the mills. They receive from \$1.50 to \$5 a day, and are kept steadily at work through the whole year. During the brisk season, which is generally in the winter-time, most of the mills run night and day.

FIRST AMERICAN MILL IN NEW ZEALAND.—Two years ago next October an Auckland miller visited the United States for the purpose of examining the latest and most approved methods for making flour in this country, with the view of securing a new plant for his mill. After making a thorough examination of our system, he invited proposals for what he wanted. The award was made to the Nordyke & Marmon Co. of Indianapolis, Indiana. The contract called for "a 500-barrel roller-mill outfit, the machinery for a 100,000-hushel modern elevator, the total price of the whole, it is said, footing up about \$80,000, the largest foreign purchase ever made in America." The material was shipped by rail to New York, making a special train of 14 cars, thence by steamer to Auckland via England, making a trip of 17,000 miles. That is a long distance to go for what you want, but if you get it there is satisfaction all round. In this case the miller (J. C. Firth) was completely satisfied and discounted his bill in advance of the test allowed. This is the first American flour-mill plant set up in New Zealand, and it is besides the first eight-hour mill in that colony, all the other mills working 12 hours, though eight hours is the rule in other industries there. Mr. Firth works three shifts every 24 hours. There was a streak of irony in this British colony taking this mill and machinery from an interior American shop all the way to England and re-shipping it thence to its destination in New Zealand. It furnishes most telling evidence of the superiority of American machinery over that of a similar class built in England.

EUROPEAN WHEAT.—Telegraphic reports say that Europe will need much more wheat this year than she can produce. There will be a very large deficiency in France, Germany, and in Great Britain. Russia, contrary to the expectations of a few weeks ago, will only produce a good yield. The late cold weather has affected both the amount and quality. The estimated deficiency in France is 156,400,000 bushels, in Great Britain 28,000,000, and in Germany 10,000,000 bushels. India will exceed the yield of 1887 by 20,000,000 bushels, and Russia by 15,000,000. No great demand is expected at once, but higher prices must come.

WHEAT BURNED.—The Los Angeles Express is informed by Mr. Mellus, a grain expert of Los Angeles, that the Laguna ranch, east of Boyle Heights, suffered a loss of some 8000 sacks by fire a short time since. Upon this there was an insurance of \$10 per acre, or about two-thirds the value of the crop destroyed. Mr. Mellus said he had one order from England for 25,000 sacks of red wheat, but knew of none to be had, at least in any quantity.

Exchequer Mining Camp.

EDITORS PRESS:—The outlook at this camp is still improving. The contract let to Batchelder & Johnson by Spawforth & Spencer opening up the Cashier mine 60 feet deeper, has been completed after cutting through a porphyry dyke of 28 feet, when they found a five-foot solid vein of fine-looking ore. The porphyry-dyke feature of the Cashier mine is a striking characteristic of the Exchequer district, and resembles the description of the geology of the Leadville district by your interesting correspondent, W. H. Storme, in the PRESS for Aug. 18th.

The Exchequer district is called a granite formation, although the rock under the microscope resembles quartz, and may be what is termed felsitic; felspar seems to be a large proportion of the mass. It would be an interesting study for a geologist to examine this district.

There seems to be associated with porphyry, porphyry dykes in the basin where the mines are found, and eruptive rocks surrounding the same on all sides.

The owners have shipped a carload of ore from three different inclines, which promise good returns.

Exchequer Camp, San Bernardino Co.

THE boom of immigration and of substantial improvement has struck the whole Puget Sound country, as well as Tacoma and Seattle, and is extending to the towns on the American side of the Straits of Fuca. The establishment of the Gloucester fishermen, who are coming into Port Townsend from the Atlantic side with their fishing smacks, has started a boom in real estate, and the hotels and all available sleeping-rooms are taken up with seekers of bargain in Port Townsend real estate.

COTTON AND WOOL.

Manipulation of Cotton Fiber.

The fiber of the cotton plant, or cotton as it is commercially called, is first presented to most cotton manufacturers after it has been ginned and baled for transportation. The process of ginning is supposed to separate the fiber from the seed and other substances which are foreign to its value as a staple for manufacturing; but the fact that nearly one-tenth of the weight of the contents of a bale of cotton as it is received at the mills is seed, leaf and dirt, shows very plainly that there is room for a great improvement in the process of gathering and ginning. If cotton is in the proper condition when it is baled, it is probable that the process of compressing it into bales as at present accomplished, does not damage it; although it has been claimed that as the fiber is tubular so much compression as is sometimes used must of necessity flatten, and thus injure it. However this may be, cotton compressed in a bale for months cannot be properly worked until it is loosened up; to do this by machinery is very damaging to the quality of the staple and increases the amount of waste; to do it by hand is too expensive. The methods of preparing cotton for the first process of working it in ordinary mills vary somewhat; but in a general way all manufacturers desire to cut the ties or fastenings of the bale, and remove the bagging from the top, several days before it is put on the opener, and either pull the bales apart, and pile or stack them up, mixing the different grades together at the same time, or let them set where the ties are cut to allow the fibers to slowly gain their natural position with reference to each other, and piling them apart but a short time before putting them on the opener. If the first method is adopted, the cotton is taken from the face of the stack, which makes the mixing more intimate still. In the second method, bales of a certain grade may be put through the first process by themselves, and laps from the different grades run together in the succeeding process. One of the conditions necessary to the successful working of the cotton fiber is that it should contain a proper amount of moisture, and if possible neither materially more nor less than the atmosphere in the different rooms through which it must pass in the various processes before it is turned out as cloth.

THE COTTON CORNER.—Late dates from New York report that there is a strong effort being made to break the cotton corner by the importation of cotton from Liverpool. Manipulators have been steadily advancing the price of August cotton for some time, until they had put it up to 11 3/8 cents, or nearly 1 1/2 cents above the price for the following month. The price equated \$7.50 per bale. At this price the bears found it profitable to send to mill-owners and to England for cotton with which to make their deliveries, and a large amount was secured and transhipped to New York. The steamship City of New York brought about 12,000 bales as part of her cargo, and, according to report, there were on the 20th of August 15,000 bales on their way from Liverpool by other steamships, while there was a large quantity in store at Liverpool ready to be returned to this country at once if the high prices for August were continued. With the exception of 20,000 to 30,000 bales which have already been sent from Liverpool, and a few that may be forwarded to New York from New England storehouses, the corner controlled near the close of the month almost the whole stock available for delivery, which is supposed to be about 200,000 bales. The short sales were at that time believed to be anywhere between 200 and 300 and 50,000 bales.

SUBSTITUTION OF MULBERRY FIBER FOR COTTON.—Repeated reference has been made from time to time of the possible substitution of mulberry fiber for cotton. The difficulty encountered has been in the trouble of separating it from the stalk. A French journal has recently called attention to an Italian invention which the promoters claim will revolutionize the fine "tissues" market, i. e., the substitution of mulberry fiber for cotton. It is said that on lifting the bark of the young shoots of mulberry trees a fiber is found which, in fineness and tenacity, is not exceeded by silk, and it remained for an invention to be made for treating the bark and isolating the fiber by a mechanical process. After studies prosecuted at Brescia, two students—the one English, the other Piedmontese—are said to have found a solution, and under their process to produce a very fine fiber, bearing comparison with flax and nearly approaching silk. The name given to the new material is *gelsio lino*, and English houses are already said to have made offers to buy all the available production.

MYSTERIOUS ORIGIN OF FIRES IN COTTON.—Fires in cotton in warehouse and on shipboard are often met with when no apparent cause can be discovered. The following paragraph from a contemporary may explain most of such cases. We believe no reason of a similar cause has ever before been suggested: "Not long ago a lot of Sea-island cotton in bales was discovered to be on fire in a New Jersey warehouse, and when the flames were extinguished in one spot, they would immediately break out in another. An examination showed that it was roller-gin cotton; that is, cotton of which the lint is drawn

away from the seeds by a pair of rollers, set at such a distance apart as to keep the seeds from entering between them, while the fiber passes on and goes into a bag. In the present case, more or less of the seeds had somehow got between the rollers and been crushed, and had thus saturated the cotton with oil, which, in due time, had caused spontaneous combustion."

Utah Woolen-Mills.

There are a number of woolen mills in operation in Utah; one each in Salt Lake, Provo, Springville, West Jordan, Beaver and Washington. That at Salt Lake City manufactures fine woolen dress goods in every variety, choice flannels, linsey sheeting, yarns, etc., and makes a specialty of fine grades of white blankets. There are 60 persons constantly employed at the mill, and 200,000 pounds of wool are used per year. A large proportion of the output is all-wool yarns, for the consumption of which they have a knitting factory in town where they employ 53 hands. The manufactured products of these aggregate in value \$100,000 per year. In quality the goods are all strictly first class and find markets throughout the whole mountain region.

The Provo woolen-mill is a very extensive establishment in which 120 persons are employed; the capacity of the looms is 1000 yards per day and over a ton of wool is required daily. Nothing but the best wool is used about the works. They make a specialty of fine flannels, plain and in all colors and designs of plaid, opera flannels in scarlet and white, also the latest styles of gents' suitings, manufacture hosiery in all colors from strictly pure yarn, and make considerable underwear from their famous seven ounce twilled flannel. They send to Colorado and Montana thousands of dozens of hand-made scarlet and men's gray hose. They have also recently done a large business in Indian robes, which they make gay enough to catch the Indian eye at once. Their carriage robes and blankets find a ready market in Chicago, and their orders for these goods are often fully up to their capacity. Their goods are sold all along the line of the Denver & Rio Grande railroad, and in return they purchase wool from the same districts.

The products of the other mills are chiefly yarns, and are absorbed in their own neighborhood.

WOOL SCOURING WORKS FOR DENVER.—Wool-washing works have lately been started in Denver, Colorado, by O. P. Crawford. Some time ago Mr. Crawford, who is experienced in all branches of the wool business, visited Denver, and saw the opportunity offered to some enterprising man or firm to establish such an industry there. Consequently, notwithstanding the possibility of the water not being of the right quality, he went ahead with his plant. Recently they made their first day's work, and the results were beyond expectation. Ten thousand pounds of wool were scoured in 10 hours, and in a perfect manner. Most of Colorado, Wyoming, Utah, New Mexico and Texas wool is scoured in the East by scouring-mills, and there is no reason why it should not be done at Denver, which is a central point. Mr. Crawford's venture will turn the tide. On account of wool being at such a low price in the East, it behooves wool growers to take advantage of everything which they can possibly find in their favor. This new plant will put many dollars in their purses, and will have a tendency to increase the wool-growing industry. E. Snow & Co. have established a wool warehouse in connection with the scourer, and they will handle the wool, either in the grease or after it is scoured. Growers will be able to get money on their wool from the Denver banks as readily as they could from the Eastern commission houses, and still have their goods under their direct control.

A MANUFACTURER'S OPINION.—Meeting Mr. Torr, of the Petaluma Woolen-Mills, the other day, we naturally inquired as to the business prospect in his line. He stated that the mill was being run to its utmost capacity, and yet the demand for flannels and blankets could not be met. Upon a suggestion that it might pay to increase the capacity of his mill, he said it had been under contemplation to do so, but that the present tariff movement had caused a postponement of the matter for the present. "For," said Mr. Torr, "if wool is put on the free list, then it will only be a question of time as to when woolen goods of foreign manufacture will be admitted free, and when that comes to pass I would not give five cents apiece for woolen-mills in the United States." Mr. Torr is an Englishman by birth and a skilled manufacturer. His opinion on such a subject should outweigh the visionary theories of a thousand impractical demagogues.—*Petaluma Argus*.

THE SHEEP INTEREST IN OREGON.—The Portland, Oregon, *Grocer* says there are 3,000,000 sheep in Oregon. The industry employs or interests 15,000 voters. No matter how these men were divided between parties before the late election, it is safe to say that every one of them felt his personal interest endangered by the Mills-free-wool bill, and that, becoming alarmed, they all rushed to the protection which was most apparent.

WOOL IN AUSTRALIA.—The wool interests of Australia are suffering severely from drouth. The sheep are reported to be dying by millions.

SHOP NOTES.

The Purchase and Use of Pulleys.

To ordinary mortals, says the *Milling Engineer*, a "cat is a cat," and to the average buyer of machinery a pulley is a pulley. Men who have made the feline race a study aver that while a cat may be a cat, there, nevertheless, exists a great difference in cats, and that there are good cats, bad cats and cats of all kinds and condition, including that special cat which each particular man feels called upon frequently to make the target of hoots, jeers, shavings-mug and other throwable articles of his hedonism. So those buyers who have made a study of pulleys and other power-transmitting machinery, aver that there is a great difference in pulleys; that there are pulleys good, bad and indifferent, of all grades—from that which is the pet of the wooden-pulley-millwright up to the perfectly proportioned, smoothly-turned, round and well-balanced pulleys produced by the best makers. There is no doubt that excellence, even in such a small thing as a pulley, costs money and experience to produce, and that perfection in a pulley, as in more important details, is worth money to the buyer. The ordinary buyer, however, hardly ever looks beyond the question of price, and his purchases are made, not with the idea of selecting a perfectly-made pulley, but rather with the view of getting the one which costs the least money. Price, and not quality, governs the purchase, and then the wonder is, why the belts do not run true and why it requires so much power to run the mill. There are establishments devoted to the manufacture of power-transmitting machinery that are using tools ten years behind the times and that make pulleys that weigh one-half more than they should, and millers who buy such pulleys have, in consequence, to use heavier shafts to sustain the extra weight and to furnish extra power to drive them. Competition is keen, and a miller cannot keep up with the procession if his machinery is not of the very best description; and if his engine is an old one and his pulleys heavy hulks of cast-iron, his trial balance will show the result at the end of the year. The policy of buying from price alone is ruining millers all over the country; and it is the "penny-wise and pound-foolish" plan that has only one end.

THE SAFETY LIMIT FOR BELTING.—Those who have the practical management of factories will find the following of value: It is a settled fact in mechanics that no piece of machinery, whether it be a belt, shaft or gear, should ever be submitted to a strain greater than one-half of its breaking strength; it follows that a belt to be lasting and durable should not be submitted to a strain greater than 100 pounds to the square inch in width. It is also an established fact that a leather belt passing over the face of a turned cast-iron pulley embracing one-half of its circumference, will give a fractional force equal to 40 per cent of the stress, so that if a belt one inch wide is passed over the face of an iron pulley embracing one-half of its circumference, and subject to a stress of 100 pounds, the fractional or driving power will be 40 pounds. If this force of 40 pounds be carried forward at a speed of 1000 feet per minute, it is evident that this force will be equal to 40,000 pounds at one foot per minute.—*Tradesman*.

HOW TO DISPOSE OF OLD TOOLS.—There is not a harder problem to deal with in a machine-shop, says the *American Mechanic*, than to decide upon what disposition to make of old tools. Too good to put in the cupola and too poor to use, is a very common condition of such machines as lathes and planers. A new tool does not need to be much better than the old one to make it possible to earn a good deal more with it, so the question of replacing old machines may be made a question of arithmetic. A little figuring in many machine-shops would provide considerable cast-iron for the cupola, and work for tool-builders, to the advantage of all parties. Poor tools at the present day effectually put a shop beyond the possibility of competing with those well equipped. There is no way to successfully compete except to take advantage of the progress made in the construction of machine tools.

CLEANING GREASY MACHINERY.—For cleaning greasy machinery, says the *Milling Engineer*, nothing can be found that is more useful than steam. A steam-hose attached to the boiler can be made to do better work in a few minutes than any one is able to do in hours of close application. The principal advantage of steam are that it will penetrate where an instrument will not enter, and where anything else would be ineffectual to accomplish the desired result. Journal boxes with oil rollers will get filthy in time, and are difficult to clean in the ordinary way; but, if they can be removed, or are in a favorable place so that steam can be used, it is veritable playwork to rid them of any adhering substance. What is especially satisfactory in the use of steam is, that it does not add to the filth. Water and oil spread the foul matter, and thus make more work. It matters not how journal boxes are kept clean, everybody will admit that they should not be allowed to get dirty. They are sure to heat and give trouble, if not cleaned and cared for. Often the oil-tanks are never emptied and the

residuum removed, and, as the pumps draw the oil from the bottom, the machinery is being daily lubricated with impure oil. The oil tank should have a thorough cleaning before new oil is again pumped into it. This is easy enough if the oil is removed, the tank inverted and the steam-nozzle applied to the mouth of the tank. This method of cleaning beats dipping the fifth out with waste. So many opportunities will present themselves when steam will be a valued help to cleaning machinery, if one happens to think of it.

SHOP DUST.—Operatives in wood-working establishments are necessarily subjected to the unpleasant and unwholesome effects of dust, and in planing-mills and similar establishments it seems to be impossible to escape this nuisance. Modern shops are supplied with machines for carrying away much of the dust and shaving made by wood-working machinery, but even in the best-equipped shops the workers are obliged to inhale more dust than is wholesome. Planing mill, sawmill and furniture factory operatives, and, in fact, all men who work in wood, have a peculiar appearance that is the result of inhaling wood dust. An observer would never mistake an old planing mill operator for a worker in a machine shop. Each bears in his face and general appearance the marks of his occupation.

GRAPHITE IN MAKING UP JOINTS.—Few steam-fitters or engineers, says the *Mechanical World*, understand the valuable properties of graphite in making up joints; this valuable mineral cannot be overestimated in this connection. Indestructible under all changes of temperature, a perfect lubricant, and an anti-rustifier, any joint can be made up perfectly tight with it, and can be taken apart years after as easy as put together. Rubber or metal gaskets, when previously smeared with it, will last almost any length of time, and will leave the surface perfectly clean and bright. Few engineers put to sea without a good supply of this valuable mineral, while it seems to be almost overlooked on shore.

FOR SHARPENING TOOLS.—It has often been said, of late, that glycerine is much better than oil for sharpening tools; but the fact that it should be mixed with a small quantity of oil is not as often heard of. The proportions of the composition should be made according to the class of tools to be sharpened. Oils with a relatively large surface is best sharpened with a clear fluid, three parts of glycerine being mixed with one part of spirits. A graver, having a small cutting surface, only requires a small pressure on the stone; in such cases, mix the glycerine with only two or three drops of spirits.

THE TENDENCY TO USE TOO NARROW BELTS. There is a tendency among machine builders to use pulleys that are too narrow for the belts to drive with, for the reason, perhaps, that a wide-face pulley will give the impression that a large amount of power is required to make them operate; so narrow belts are prepared with the idea that they can be laced up till the machine is set in motion. It would take a great deal of the load from the bearings if the wide belts could be used, that they may not be strained all out of shape in transmitting power to the driving-shaft.

ADVANTAGES OF A TOOLROOM.—It has been thoroughly demonstrated that in all large shops the loss of time of the workmen in hunting up tools and putting them into proper condition when injured or spoiled by some unknown other person who had them before, was very much more than the cost of fitting and maintaining a toolroom with all its paraphernalia. Small shops should have, at least, a place for tools; and every tool should always be kept in place.

TO KEEP MACHINERY FROM RUSTING.—In order to keep machinery from rusting, take one ounce of camphor, dissolving it in one pound of melted lard; take off the scum and mix in as much fine black lead as will give it iron color. Clean the machinery and smear it with this mixture. After 24 hours, rub clean with soft linen cloth. It will keep clean for months under ordinary circumstances.

TO SOLDER A JOINT that is to be carefully united, the surface must be nicely fitted with a file and then cleaned thoroughly before bringing the parts together. A piece of tinfoil will occupy a small space and cover the whole surface, and when the work is heated slowly in a fire, the parts can be united so nicely that the joint will be almost invisible.

A CONTRACT has been signed by the Moss Bay Iron and Nail Company of America and the Seattle, Lake Shore and Eastern Railway Company, by which the former company is to manufacture 20,000 tons of steel rails for the latter company, delivery to commence the 1st of next July and to be finished before July 1, 1890. The works of the Moss Bay Company at Kirkland, on Lake Washington, five miles from Seattle, will be put up at once. The works will employ 1000 to 1500 men, and will be the largest west of the Mississippi. Their iron supply is in Snoqualmie pass, about 30 miles from the works.

IN Bombay, India, operatives in cotton and jute mills are paid 12 cents per day.

OUR LUMBER INTERESTS.

Forestry Experiments in New England.

The most profitable system of forestry in New England is said to be that which devotes principal attention to the planting of white pines on the sandy ridges and plains, which are of little value in general agriculture. The sapling pine is the cheapest wood grown at this section, and the most prolific; the earliest grown and the earliest to reach a remunerative and marketable stage. Hard wood makes a growth so slow as to discourage the planter. Whatever theoretical writers on forestry may urge concerning the rapid growth of hard-wood trees on ordinary soil, the actual experience of those who have watched the development of deciduous trees for years proves that all expectations of satisfactory profits are delusive.

A practical New Hampshire lumberman planted some sugar maples under the most favorable conditions on good corn or grain land. They were about an inch in diameter when planted. It is now 30 years since they were planted, and yet they do not average over 16 inches in diameter.

From 1815 to 1820, some six acres on the same farm, which had been cultivated to crops for a few years, was abandoned for cultivation, and the land was soon covered with a thick, thrifty growth of white pine, self-seeded. From 1860 to 1865 and afterward thinnings were made of trees for aqueduct logs and other purposes. In 1880 the pines were all cut off and sold for market, fetching about \$6 per 1000 feet on the stump, and yielding, say 20,000 feet average to the acre on a money value per acre of \$120. These pines were rather coarse saplings, many of them measuring two feet in diameter at the butt. The same land was self-seeded to white pine again, which is coming up thick and thrifty. Adjoining the above is another six-acre lot on the same farm, on a little higher and drier ground, carrying a better soil. Between 1800 and 1810, there were cut from this lot many thousand feet of heavy, old-growth pine timber. The land was not cleared for a crop, but permitted to come up almost exclusively to a growth of sugar maples self-seeded. After these maples reached the age and size to admit of tapping for sap, they received some care and thinning out, yet even now, in 1888, they only show a growth of 12 to 15 inches diameter at the butt. No one could claim this growth to be profitable if undertaken as a business. This growth of maples, except some butt cuts, is worthless for sawing into lumber. It is so full of limbs and knots as to be only fit for wood worth on the stump \$1 per cord. The growth would probably cut 30 cords per acre, and yield its owner \$30 per acre against the \$120 per acre received for the pine on the same farm in 1880.

This account is interesting as showing the pine growth, self-seeded, following the growth of elm and white maple, and again a grove of sugar maples following the old pine. No doubt the last-mentioned land was full of pine-seeds when the old-growth pine trees were cut and removed, but probably the one kind of growth continued for many years had exhausted the soil of the particular plant food demanded in any subsequent growth of pine. Hence the maples germinated, grew and covered the ground.

Considering the time and expense necessary in producing the magnificent hard woods now standing in many sections of New England, this variety of lumber, through lack of appreciation and excessive supply, has never commanded its true value. Our hard-wood forests are sufficiently extensive to supply present demands for many years; but their renewal in future times will prove them less profitable and less prolific than the white pine, which finds so congenial a soil and climate in many sections of New England.

ALL the cedar-shingle manufacturers of Washington Territory held a meeting recently and organized a shingle trust, known as the North Pacific Shingle Manufacturers' Association, with Wm. Page, of Tacoma, as president; Geo. E. Atkinson, of the Pacific Mill Company, as vice-president, and Jos. M. Blaine, of the Tacoma Cedar Company, as secretary. The meeting developed the remarkable fact that this association will combine the interests of some 50 shingle-mills. A trust, similar to the great lumber trust of San Francisco, will be organized with a view to more successfully controlling the prices and quality of the immense quantities of cedar shingles now being shipped East. Representatives were present from the south as far as the Columbia river and as far north as the Skagit river. The association will embrace all the territory north of the "Redwood line" in California.

THE Sisson Lumber Co. has, during the past month, shipped to points in Southern California and Texas, 10,000 cedar telegraph poles. A curious feature of this traffic is the fact that telegraph poles are also shipped from southern points in this direction to be used north of us. It is difficult to understand what conditions would warrant this interchange. —*Sisson Herald*.

MR. C. LONEY has been recently engaged in building sawmills and setting machinery for the Pacific Lumber Co. (the old Burkhalter mill) in place of the plant destroyed by fire a few months ago. The Pacific Lumber Co. has now one of

the complete lumber manufacturing outfit on the Pacific Coast, and everything is working well. The lumber is made near the railroad at Clinton. The logs are brought from the mountain on narrow-gauge railroad cars a distance of seven miles, the railroad outfit belonging to the Pacific Lumber Co., and then the logs are delivered at the sawmill by a shoot or slide that is 1900 feet long.

THE DUTY ON LUMBER.—The Senate Tariff bill, so far as it relates to lumber, would work a great hardship on that industry in the Northwestern States and on the Pacific Coast. Across the border, almost everywhere in the British Dominion, the lumber districts are leased at exceedingly low sums, and if the duty on lumber was lowered, doubtless they would ship their lumber over to our markets and be able to undersell our own lumbermen, and after they succeeded in virtually destroying the business here, they would shove up the prices and control the sale of timber. It is gratifying to know that the entire Pacific delegation is a unit in opposing any such proposition.

SHINGLES SHORT IN NUMBER.—Complaint is made in San Bernardino that many shingles which are sold in that market contain only 200 in number, while they should contain 250. We are not informed where such shingles are put up.

The shingle mill at Olympia, W. T., was destroyed by fire on Aug. 21st. The mill contained 200,000 shingles ready for shipment, and about 20 cords of shingle bolts, all of which were destroyed, as well as all the machinery.

ADVISES from Santa Cruz stated that on the 10th of August there were cut 143,000 feet of lumber in eight hours, from 125 immense logs. This is the greatest known run of a sawmill with a single set of saws.

THE BUILDER.

The Philosophy of Architecture.

Prof. Black recently delivered an address on the above subject before the Edinburgh Architectural Association, from which we collate as follows:

The professor said if houses were to be called architecture, they must have some expression of the eternal principles of beauty according to which the Divine Being had created the universe. Architecture was the poetry of masonry, and masonry meant light and shelter. If architecture was a fine art it was not to be got at by any induction made by any microscopic scientific peeping, analyzing or classifying; but, like poetry and painting, from the inspiration within. The first essential in architecture was order, on account of the idea of practical utility underlying it. Some structures looked like a body squeezed by the wings, or like a congregation of elephants, rhinoceroses and hippopotamuses with their snouts in a manger and their posteriors turned to the golf players in the Links.

The next thing was proportion. Among the elements of the divine perfection which architects, as distinguished from poets, was specially calculated to express were weight, solidity, repose, mass, magnitude, light, elegance, polish, attitude, aspiration, trimness, neatness, comfort, openness and expansion. We should have Scottish architecture as we have Scottish songs. Some buildings expressed the whims of the architect, not the style of the country.

It was out of the nature of things to put a big flat story on the top of an ornamental base, and if the portrait gallery on Queen street were in the New Jerusalem he would condemn it. Attics he detested; there was no such thing as beauty in a sloping roof, and he had nothing but fault to find with the pillars which supported nothing at all. The cause of incongruity in buildings was the absence of a unity of conception in the mind of the architect, the want of what Ruskin called the "lamp of truth," or that consistency of scheme which gave truthfulness to a building. Their whole attitude of mind was of borrowing or stealing, and that was always a dangerous thing.

TO FINISH A BRICK WALL.—To make a good finish of brick front or wall, give it at least one good coat of oil color—two coats will make it more permanent. For the preparatory coat or coats, if the work is to be finished red, use ordinary Venetian red ground in oil; and if an imitation of Milwaukee bricks, use oil white stained with yellow ochre and a little blue, to a shade darker than the finishing color. Having coated your work with oil color, the finishing coat must be "flat" if you wish to imitate bricks. No fear need be entertained that "flattening" will not wear. Care is required in applying the "flattening" to cut in the bricks at the finishing of each stretch to break the joints, so as to prevent glossy spots.

A TEST OF FIREPROOF WIRE LATHING was recently made at Germantown, near Philadelphia, which is referred to by a Philadelphia paper as follows: A substantial two-story brick structure, about 8x12 feet in size, had been erected, with a stout dividing wall in the center, making two compartments. One apartment had its ceiling of wooden lath, nailed to

joists and plastered over, and the other of wire cloth, upon which the plaster had been spread. A hot fire was built in each compartment after everybody interested had an opportunity to inspect the preparations by going up a ladder to the top of the structure, upon which no roof had been placed, the better to subsequently compare results. At the end of ten minutes, when the fire was extinguished, the wooden lathing had burned away, the plaster had fallen into the ashes beneath, and the joists became charred from the flames. In the other compartment, where the wire cloth was used, it and the plaster remained intact at the end of that time, as it did over an hour afterward, when the fire there had been allowed to burn out. The test seemed to meet the general approval of the spectators, who commended the use of the wire lathing in buildings intended to be fireproof, or, at least, slow burning.

FIREPROOF BUILDING MATERIAL.—The *Real Estate Record* says that fire ruins show that porous terra-cotta bricks and blocks best resist fire, water and frost. Next to these in the order of fire-resisting qualities come concrete and burned clay work. In the best work done, the ironwork is incased in porous terra-cotta, tile or brickwork in roof, floor and tile construction. The hollow tiles are faced with vitreous tiles, slabs or any good weather-proof coating, or with a single thickness of brick. Iron and steel framework incased in fireproof materials gives the best possible results. There is a growing preference for light porous walls of hollow material protecting an iron or wooden framework. Massive and heavy walls of brick or stone will do for architecture, but they are not as much of a mechanical necessity as they were regarded a few years ago.

STEEL PLATES FOR HOUSES.—A new system of building houses of steel plates is being introduced by M. Dunly, manager of the Societe des Forges de Chatelansan. It has been found that corrugated sheets, only a millimeter (.0394") in thickness, are sufficiently strong for building houses several stories high, and the material used allows of architectural ornamentation. The plates used are of the finest quality, and as they are galvanized after they have been cut to the size and shapes required, no portion is left exposed to the action of the atmosphere. Houses so constructed are very sanitary, and the necessary ventilating and heating arrangements can readily be carried out.—*Industries*.

BUILDING IN THIS CITY.—In this building line the long list of newly-filed contracts is proof positive of much activity, and there are still contracts to be let for three or four large brick buildings. The Parrott building on the site of the old Jesuit college, the California Electric Light Co.'s works, the Crocker warehouse, the engine-houses for the Omnibus Cable Co., and the new Olympic Club building will all be commenced this fall, and will give employment to hundreds of workmen, while there is every prospect that there will be, at least, the usual number of smaller business buildings and residences.

STEAM BOILER NOTES.

PROGRESS IN STEAM-BOILER MANUFACTURE.—The steam engine, in its original construction, says a contemporary, was in most cases the plain single cylinder expansion engine, using preferably the condenser. The use of the condenser was almost a necessity, owing to the inability of the original boiler to generate steam of any very great pressure, at first of not more than ordinary atmospheric pressure. As the construction of the boiler improved, higher pressures were attained, and increased pressures and power were used and developed in the engine. This increase of pressure progressed until 15 to 20 and 25 pounds per square inch was reached, when another halt took place, due a second time to the inability of the boiler to do better. But improved constructions and thicker plates, together with improved strength in the material, has again placed the boiler fully up to, and, in fact, well beyond, the demands of the engine. At the present time and for some years back there has been no demand made, no matter how high the pressure upon the boilers, that cannot be well met and with positive safety.

COMPOUND ENGINES.—Compounding large steam engines is making decided progress in this country. William Tod & Co., of Youngstown, Ohio, have just shipped the third of 500 horse-power, to the Chicago Arc Light and Power Company, and are now building one of 700 horse-power for the California Electric Light Company of San Francisco. Among recent orders are one 100 horse-power from the Haitnam Steel Company, two of 250 horse-power each from the Kokomo Wood Pulp Company, and one of 750 horse-power from the Westmoreland Paper Company, all compound engines.

STRANGE THINGS ABOUT STEAM.—When water once begins to boil, it is impossible to raise its temperature any higher; all excess of heat is absorbed by the escaping so-called latent heat, and is given out again when it condenses. We often speak of seeing the steam escaping from the spout of a kettle, but this is incorrect; steam is an invisible vapor, and we can no more see it than we can air. What we do see are

the minute drops of water into which the steam condenses on coming into the cool air. If we boil water in a glass flask, we shall notice that nothing can be seen in the interior; and by observing the steam escaping from a kettle, we shall notice that there is quite a distance between the end of the spout and the point where the cloud becomes visible. This cloud of steam is of exactly the same nature as the clouds which float in the sky, and which are formed by the condensation in the cool upper regions of the steam or aqueous vapor present in the air.

IN GENERATING STEAM, experiments under various boilers show 1000 feet of gas to be equal in heating-power to from 80 to 133 pounds of different kinds of coal. One pound of coal equals in value $7\frac{1}{2}$ feet of natural gas. The latter explodes violently when mixed with 9 to 14 parts of air. When burned with pure oxygen the flame temperature of the natural gas is estimated at 7100 degrees centigrade. When burned with just enough air to secure perfect combustion, the temperatures are estimated at 2363 degrees centigrade for natural gas and 1700 for Siemens.

STEAM JACKETING.—The question of the economic value of steam jacketing cylinders appears to be no more nearly settled in Britain than here. The fact seems to be fairly established, that under certain conditions, steam jacketing shows an important gain, while under other conditions there is no gain, but, on the contrary, a loss. The difficulty seems to be in determin-

Coast Industrial Notes.

MR. GRIFFITH is employing 40 men at the Penryn quarry, and 80 at the Rocklin quarry.

THE fires of the Fresno Agricultural Machine Works are run with coal from the mines in the Coast Range, 20 miles from Huron.

LEACH's large planing-mill and the Pioneer Box Co.'s factory at Moore's Station, not far from Marysville, were destroyed by fire Aug. 13th; loss, \$30,000.

THE Mott Water Company (Sbasta county) has built a trestle 87 feet high and 470 feet long across the big canyon, for supporting a 22-inch pipe conducting water to the main reservoir for supplying the town with water.

THE Ranger, which recently returned from a surveying trip along the coast of Lower California, is now alongside the Navy-yard wharf and will probably remain there until November. Considerable repairing will be done to her boilers and engines—in fact \$5000 is needed for the purpose.

THE Oregon Coal and Navigation Co.'s steamer Ajax was launched Aug. 21st, from Boole & Beaton's yard at the foot of Sixth street. The Ajax is intended for the coal trade, and will ply between this port and Coos bay. She is 220 feet in length, 32 feet beam and 16 feet in depth of hold.

THE fruit canneries at Portland, Or., have out signs stating that no more Bartlett pears, plums or prunes can be taken. The canneries

300,000 boxes, being 100,000 more than last year. This shows that the Chinese recognize the absence of profit afforded by our political campaigns.

MESSERS. KENDRICK & GADDIS are busily engaged in constructing the buildings for their new distillery in Nevada county. They have selected a site by a never-failing spring, about a mile southeast from Sims' store at Town Talk. The distillery proper will be 20x20 feet in ground dimensions, the cistern-room, 10x10 feet, and the storeroom, 12x12. The machinery has been ordered from San Francisco.

THE Santa Rosa *R publican* says the woolen-mill at that place has been sold to a company at Oroville, Butte county. Mr. Walker, the secretary of the mill company, says the scarcity of wool in this section of the State and the extra freight charges necessarily involved in securing it make the mill a different institution, financially, from what it was before our sheep ranges were converted into orchards and vineyards.

ORDERS have been sent to Akron, O., for the machinery to be used in the work of the California Vitrified Sewer Pipe Company, now in course of construction near Los Angeles. There has been burned at Elsinore a kiln of 100,000 firebricks to be used in the sewer-pipe kilns. The making of the machinery will be pushed with all possible dispatch, and it will be on hand by the time the building is completed. The Atchison, Topeka & Santa Fe Railroad Co. will build a spur track about eight miles in

will be the first vessel used in the inauguration of an enterprise which the projectors think will revolutionize the coal-carrying trade of the coast. The house which was placed on the old bulk to make her available as a pest-ship will be removed, and the lower masts, which are still in place, will be rigged with fore and aft sails. The boilers and machinery will all be removed, so that the entire hold will be available for stowing cargo. The vessel will be thoroughly braced and bulkheads put in. When all the alterations have been completed the hulk will be taken to Puget Sound in tow of a powerful steam-tug. The owner of the hulk and others are interested in a productive coal mine, the output from which is delivered in the bunkers of the Northern Pacific Railroad Company at Tacoma. The vessel will be loaded with this coal to the extent of her capacity, which will be about 3000 tons. The loaded ship will then be towed back to San Francisco to unload.

IN the large white laundries of this city and Oakland a gradual change has been at work toward the substitution of the female for the male sex. In former years it was not considered possible that girls and women could produce results in the laundrying line that could be as satisfactory to patrons as the work of men. The introduction of the gentler sex into the laundries was at first discouraged as an act of cruelty, as the work was certainly very hard and the duties exacting in the extreme. As improvements were made in the system by which soiled linen was rendered clean and the work became less arduous, the girls were per-

VESSELS LOADING WITH COAL AT TACOMA, W. T.

ing what conditions call for a steam jacket. Further experiments seem to be required.

STOP VALVES.—A correspondent of *Engineering* makes the sensible suggestion that stop valves on marine boilers should be so arranged that they can be closed, in an emergency, from the upper deck. While this has been done in a few instances, as a rule the stop valve on the boiler is so placed that in case of the bursting of the main steam pipe it is impossible to shut off steam, and this has resulted in fatal accidents.

DEFECTIVE BOILER TUBES.—The *Locomotive* offers some good advice in regard to defective boiler tubes. Continual leakage around new tubes, where the boiler is clean and the water is good, generally indicates, it says, something wrong in material or workmanship. Severe expanding of the tubes splits the ends. When this is the case the boiler will always be tender at this point, with a tendency to leak badly.

TIME TO QUIT.—A boiler at the Merton colliery, near Seaham Harbor, Eng., celebrated the completion of the fiftieth year of its service by a pronounced protest against further service. The fireman was killed and others injured. There were no less than 90 small plates in the boiler, and the original thickness of the material was three-eighths of an inch.

HIGH-SPEED ENGINES.—The desire has been expressed that high-speed engines as they are built should have their speed tested by some accurate recording instrument in regard to the regulating of their speed, as it is thought by many that it will be found that they are by no means constant from second to second.

THE Quebrada Copper Mining Company is shipping ore to Battle Mountain, and the *Central Nevada* predicts shareholders will receive a dividend before 12 months.

are running day and night, and have already more fruit than they can dispose of. The fruit crop and grain crop of Oregon are the largest and finest ever known in the history of the State.

THE Santa Barbara *Times* says: Larco & Sons, who man the greater part of the fishing fleet here, report a grand season for mackerel. The fish are like Eastern mackerel when salted and dried, and are now daily hooked in immense numbers. Baracouda, cod and half a dozen other varieties of large fish are also in the market.

THE Iroquois is still in the stone dock at Mare Island, with the repairs to hull and engines nearly completed. It is probable that she will be ready for commission by the 1st of November, as the work on the boilers and the enlargement of the berth deck are well under way. The vessel's frame was found rather more solid than was expected.

THE latest industry added to the list of California's productions is the manufacture of Saratoga chips. In a stall at the Mechanics' Fair appears a splendid display of these edibles, neatly put up in half and quarter pound boxes. A factory has been erected at 623 Geary street, and so large has the demand grown that the product is now about 5000 boxes per week.

ARTICLES incorporating the Skagit Coal and Iron Company were filed at Seattle, W. T., recently. The capital stock is \$1,000,000. The coal on the Skagit river is said to be the finest ever discovered on the Pacific Coast, and the combination of coal and iron lying alongside each other enabled iron and steel to be produced at a minimum of cost. Coke ovens will also be erected at once.

LOCAL manufacturers of costly pyrotechnics are quite busy at present making up large stocks of fireworks for the fall campaign. Presidential years are greatly appreciated by this class of workers. The importation of firecrackers this year, it is stated, will amount to

length from its California Central line to the bed from which the clay for the sewer pipe is to be taken. This bed is near Elsinore. Crude petroleum will be used by the sewer-pipe company in the burning of the clay. About 150 men and boys will be employed at the works.

GRASS VALLEY wants a fruit cannery. The fruit-growing business of this section is largely increasing, the new orchards that have been planted will add largely to the annual crop in a year or two more, and provision must be made for that portion which cannot readily be sold for shipment or local consumption. The fruit-canning business has been found to be profitable wherever started in the State, and the number of such establishments is increasing from year to year. The demand for good canned fruits is practically unlimited, and those of California preparation are already finding a world-wide market.

A DISPATCH from Tacoma, Washington Ter., says: The fishing schooner Oscar and Hettie arrived here yesterday with 150 tons of halibut, which is being packed in refrigerator cars at the wharf, preparatory to being shipped to St. Louis, St. Paul, New York and Boston. The fish are exceptionally fine in quality, and were all caught outside Cape Flattery in three days of this week. Capt. Johnson, the owner, who brought his vessel from Gloucester, Mass., round Cape Horn, expects to be able to make shipments of fresh halibut East every two or three weeks, and to supply the Eastern market with a superior quality of fish at least as cheap as the Gloucester fishermen can. The Northern Pacific railroad has arranged to give special dispatch to fresh halibut and cod shipped. A number of other Gloucester fishermen are expected here shortly with their vessels and tackle, and shipments will be made almost daily to the Eastern markets, soon after their arrival.

THE old Confederate cruiser Shenandoah is to be placed in active service once more, and

mitted by slow degrees to take possession of the big laundries. It was only recently, however, that the largest laundry in the State made the change in the sex of its employees. Now the greater number of persons employed in laundry work in that great cleansing establishment are women and girls. They labor for a less rate of wages than men and do nearly the same amount of work. There are now about 125 white laundries in this city, large and small, and they employ altogether about 1200 men, women, girls and boys. Of Chinese laundries there are about 200, employing nearly 1500 men.

Washington Coal-Fields.

We present on this page an illustration showing the manner of loading vessels with coal at Tacoma, W. T. Tacoma is one of the ports on the sound where a great deal of the coal mined in the tributary regions is loaded into vessels to be transported to San Francisco and other markets. These coal-fields are vast in extent and comparatively inexhaustible. The chief supply-points for Tacoma are South Prairie and Carbonado. From these places the Northern Pacific Co. has built railroad tracks, and hauls the coal in 50-carload trains to the great coal-bunkers of the company on the Tacoma water-front. The track leads by easy grade to immense bins some 50 feet above high water, from whence the coal is dumped by the tens of tons into the holds of vessels lying alongside or beneath. This is a great and growing industry and one which will contribute for generations to the wealth of Western Washington Territory.

NEARLY half a ton of gold bearing quartz has been taken from the Michigan mine at Ishpeming. The week's output was worth \$67,000. Free gold-quartz has also been found in the bottom of the gold shaft of the Lake Superior Iron Co.

NOTICE TO GOLD MINERS! SILVER-PLATED AMALGAMATED PLATES For SAVING GOLD!

IN QUARTZ, GRAVEL, OR PLACER MINES. MADE OF BEST SOFT LAKE SUPERIOR COPPER
FULL WEIGHT OF SILVER AND BEST QUALITY OF WORK GUARANTEED.

GET OUR PRICES BEFORE ORDERING ELSEWHERE. SAMPLES
FURNISHED ON APPLICATION.

**SAN FRANCISCO NOVELTY AND PLATING WORKS,
No. 108 FIRST STREET.**

NOTICE.—All our plates are guaranteed to have the full weight of silver agreed upon, and are tested before leaving our works, thereby avoiding the complaints about light weight, made so often before we started in this branch of industry.

THE JOSHUA HENDY MACHINE WORKS, Nos. 39 to 51 FREMONT STREET, SAN FRANCISCO, CAL.

"HENDY" IMPROVED "CHALLENGE" ORE FEEDER.

The best form of Feeder ever devised, and pronounced by reputable mining men to be far superior to any form of "Roller" Feeder manufactured. We refer to the following gentlemen who have furnished us with testimonial letters to the above effect, which can be seen at our office, viz.:

N. W. CROCKER, Supt. Bunker Hill Gold Mining Co., Amador City, Cal. D. C. WICKHAM, Taylor Mine, Greenwood, Cal.
J. R. TREGLOAN, Supt. South Spring Hill Gold Mining Co., Amador City, Cal.
W. G. ROBERTS, Greenwood, El Dorado Co., Cal.

WE ARE MANUFACTURERS OF THE

'CHALLENGE,' 'STANFORD,' 'TULLOCK,' & 'ROLLER' FEEDERS,
And will furnish descriptive Catalogues and quote prices upon application.

THE ROLLER ORE FEEDER

[Patented May 28, 1882.]

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.
In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

**Golden State and Miners' Iron Works,
Sole Manufacturers,
527 First Street, San Francisco, Cal.**

TO ALL INTERESTED IN THE USE OF

GOLD & SILVER MINE

Now Under Development,

Together with many additional claims. Shaft down (in ore) 120 feet. One carload already shipped, \$1750. Capital wanted to further develop, rapidly. To these meaning business, good terms will be offered. Mines 8 miles from railroad. Address,

J. B. BAINBRIDGE,

Box 380.

Pasadena, Cal.

FOR SALE.

2 Triumph Concentrators.
1 New 12-inch, 35 H. P. Engine.
VERY CHEAP. Apply
130 Sansome St., room 12.

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; is in successful operation and we guarantee its work as represented.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

FRISBEE-LUCOP MILL COMPANY,

GIDEON FRISBEE, Manager, 461 Howard St., San Francisco.

HOOKE & LAWRENCE, Gen'l Ag'ts, 145 Broadway, New York.

THE RAND DRILL COMPANY, 23 Park Place, New York.

We are now so situated with our new works as to offer to the miners of the Pacific Coast SMALL AIR-COMPRESSING PLANTS at such prices that almost any small mine can afford to put in power drills if they have none in use.

By our NEW AND PATENTED SYSTEMS (by which the duty or performance of drills is not reduced with use) it is no longer necessary PLANTS IN THIS COUNTRY, and has patterns for all sizes up to 40-inch diameter of cylinder.

In respect to capacity, SPEED OF DRILLING, perhaps it is in order to say that in EVERY AUTHENTIC TEST CONTEST for speed yet initiated, the RAND DRILLS have, without exception, BEEN VICTORIOUS. This fact, coupled with another important one, that the drills use much LESS AIR and cause LESS REPAIRS, has won for them nearly all of the Eastern mining trade, which has kept their works always busy.

Since the reasons which formerly restrained us from the California market no longer exist, we are now in the field for the business.

SPECIAL ATTENTION is called to the latest designed sectional Compressor just built for the Batopilas mine in Mexico, and to the Compound Engine Compressor built for the Anaconda mine in Montana.

**JAMES LEFFEL'S
Mining Turbine Water Wheel.**

These Wheels are designed for all purposes where limited quantities of water and
high heads are utilized, and are guaranteed to give more power with less water than
any other wheel made. Being placed on horizontal shaft, the power is transmitted
direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted to
capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the
ordinary Vertical Turbine for Wooden Penstocks and in Iron Globe Cases, free of cost,
by applying to the manufacturers.

Mining Share Market.

The movements of the mining share market have, during the past week, been like that of the door on its hinges, going back and forward, but making no progress. If the prices of the "securities" have wobbled enough to allow the brokers and "chippers in" to make cigar money, that is probably all that can be claimed for them.

Notwithstanding this untoward condition of the market, the mine are producing fairly well, the amount of net earnings made, though less in the aggregate than when the Comstock was making its abnormal output of bullion, being fully up to the standard of late years, those earnings being at the same time more widely distributed than was formerly the case. But a stagnant share market and a large bullion production are not in mining affairs a phenomenal condition of things. They very often go together—so often that the existence of the one almost implies the existence of the other. When the mines are making good earnings the insiders manage to depress the prices of shares preliminary to gathering them in.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports: Mount Diablo, Sept. 1, \$3427 88; Nevada Queen, 2, \$24,000; Eberhardt-Monitor, 3, \$2000; Monitor Belmont, Aug. 31, \$5000.

Please Remit.

Too large a number of our subscribers are in arrears on this paper. Now that we have been a little overhauled to such, there is the stronger reason that they should make an extra effort to remit the amount due us for subscription without further delay. We have been very earnest and sincere in presenting a paper to each and every one of our subscribers well worth the price asked for it when paid in advance, and in justice to ourselves we must now insist upon all subscribers in arrears paying up. While to each individual the amount is small, collectively it is large to us, and we are obliged to urge settlement.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, term of subscription, and give it their own patronage, and as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of progress, knowledge and science, by assisting Agents in their labor of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

G. W. INGALLS—Arizona Territory.
A. F. JEWETT—Tulare Co.
C. E. WILLIAMS—Yuba and Sutter Co.'s.
JOHN L. DOYLE—Oregon, Montana and Idaho.
W. W. THURMAN—Sonoma, Napa and Yolo Co.'s.
F. B. LOAN—Nevada State.
S. J. LITTLEFIELD—Santa Barbara, Los Angeles and San Diego Co.'s.

J. A. JOHNSON, 307 Montgomery street (the Nevada Bank building) is the general agent of the Stiles quartz machinery, and offers easy terms for introduction.

Dewey & Co., American and Foreign Patent Agents.

PATENTS obtained promptly; Caveat filed expeditiously; Patent Reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences presented; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Soliciting promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and thoroughly established. Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We can and do get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) sooner than other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of most inventions discovered here than any other agents.

Situated so remote from the seat of Government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars of information to inventors, free.

Home Counsel.

Our long experience in obtaining patents for inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

Engravings

We have superior artists in our employ, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

THE LIXIVIATION OF SILVER ORES WITH HYPOSULPHITE SOLUTIONS

(With special reference to the Russell process),

BY C. A. STETEFELDT.

Treatise on the Chemistry and the Practice of the Lixiviation Process

Published and sold by the Author, 18 Broadway, New York.

Price \$5.00, Registered Postage Prepaid.

Remittance should only be made by Bank Draft, or by P. O. Money Order, payable to the order of C. A. STETEFELDT.

HOSKIN'S
IMPROVED
ONE-JOINTED
HYDRAULIC MACHINE.

The statement of Mr. Joshua Hendy that any style of machine is an infringement on any style manufactured by him, he knows to be absolutely false. The Supreme Court of the United States on March 10th decided that the pretended patent for infringing, which he has for years been fleecing miners for royalty, is absolutely void, with costs of suit to Hendy & Fisher. I am the inventor of all styles in use, and am prepared to fill orders to suit customers. Send for list of prices of Hydraulic Machinery. R. HOSKIN, Empire Foundry, Marysville, Cal.

FROM 2 TO 100 H. P., ALWAYS IN STOCK

MILL SUPPLIES AND LUBRICATING OILS.

THE DOUBLE "ECONOMIC" STAMP MILL.

We have here the Stamp Mill in a cheap and simple form. The high drop of the old stamp is more than compensated for by the great weight (1200 lbs. each) of our stamps, and the rapidity (300 strokes each per minute) with which they run. There are 4 shoes in each stamp, so that there are 4800 strokes of the shoes on the dies per minute. Less power is required than in any other mill to do the same amount of work.

The Mortar has screens at both ends, giving ample discharge. There are no cams or tappets to wear or be adjusted. The stamps adjust themselves as the shoes wear.

AN AUTOMATIC ORE FEEDER

Goes with each Mill. We also have a suitable

Rock Breaker.

Several Mills are now in the mines doing excellent work. The "Economic" is not only a mill for small mines, but we believe it is destined to SUPERSEDE THE OLD STAMP IN MILLS OF THE LARGEST CAPACITY.

TATUM & BOWEN,

ATTENTION, GOLD MINERS!

WE ARE SELLING

Silver-Plated Amalgamating Plates

For Saving Gold in QUARTZ, GRAVEL and PLACER MINING,

At reduced rates. Get our prices. Three thousand orders filled. Fifteen medals awarded. Our plates have proved the best, and far superior to others in weight of silver and durability. Old mining plates replated. These plates can also be purchased of JOHN TAYLOR & CO., cor. First and Mission Sts.

SAN FRANCISCO GOLD, SILVER and NICKEL PLATING WORKS,

E. G. DENNISTON, Proprietor.

653 & 655 Mission St., San Francisco, Cal.

NOTICE.—Our Silver Plated Plates have always proved as represented. We have been manufacturing them for 20 years, and use only the best Lake Superior Copper and Refined Silver. Comparing our plates with those of other manufacturers, after repeated tests, we can safely guarantee much better plates for the same money. Our plates are used by all the prominent mining men on the Pacific Coast. SEND FOR CIRCULAR.

Progressive Costa Rica.

Mr. E. G. Gaertner, mining engineer and superintendent of the Costa Rica Exploration Company, to whom we have on former occasions been indebted for much valuable information concerning that country, being again in the city, has favored us with a call. From Mr. Gaertner we learn that the several mining enterprises by foreigners, lately set on foot in Costa Rica, are in a prosperous condition, some of them succeeding beyond expectation; of these the most notable are La Trinidad, formerly owned by the Exploration Company, now the property of English parties, and La Union, which the Exploration Company still owns, and is working in an active and profitable way.

Oa La Trinidad mine a 40 stamp mill has been erected, and is now running. On La Union a 60-stamp mill is up and nearly completed. These mines are situated in the District of Cirreelitas, 20 miles north from Punta Arenas, the principal port of Costa Rica on the Pacific side. Connecting the mines with the port is a road capable of being traveled by two-wheeled carts. These vehicles are drawn by oxen, which haul from two to three tons to the load—cost of freight, \$30 per ton. The face of the country is rough, rendering the construction of good wagon-roads difficult and costly. Most of the transportation, all of that to more distant points, is done with pack-animals. The country is everywhere well supplied with wood and water, all the machinery in use being water-driven. The streams are generally rapid, making it possible to obtain almost any desirable head without building very long ditches. At La Union mill the water is delivered on a double-hocket patent wheel under a pressure of 450 feet.

Among the more common trees are rosewood and cedar, the former being used for battery posts and the latter for battery blocks. Some of the rosewood trees cut down for this purpose would bring a small fortune in San Francisco.

The Exploration Company has secured government title to 14,000 acres of land, much of it mineral-bearing. The mines here all consist of auriferous quartz. There are no placers. The ledges are large—20 to 60 feet wide—occur in porphyry accompanied by dykes of sienite, their general strike being northwest and southeast. The ores are easily crushed and yield an average of \$15 per ton. The most of the gold is free, the concentrates being worth not over \$60 per ton. The Exploration Company employs native miners with a little imported skilled labor. The English company employs Italians, a hundred having lately been imported for this service. Native labor is cheap and tolerably efficient. La Trinidad mine has been worked for the past ten years, and has produced over \$400,000 with imperfect machinery. In the Aguacate district, farther in the interior, a good many quartz mines are being worked in a small way, the natives having not yet got into the practice of using improved machinery. Gradually, however, as they see the advantages of our method of carrying on the business, they will come to adopt it. All mining machinery for that country will be obtained in San Francisco. The big mills already put up there were made at the Union Iron Works in this city.

Of all the Central American States, Costa Rica is the most thrifty and progressive. The

natural resources of the country are also very great. Besides gold and some silver, Costa Rica produces several of the tropical staples in large quantities, such as indigo, sugar, cocoa,

PERSONAL.—We received a call last week from Mr. E. G. Gaertner, mining engineer of Punta Arena, Costa Rica, who favors the MINING AND SCIENTIFIC PRESS with an occasional

Scraper Ready to Fill.

Scraper Dumping Its Load.

THE "DEEVY" WHEELED SCRAPER.

coffee, sarsaparilla, etc. The climate is generally healthful, more especially in the interior, the temperature varying with elevation. This Republic extends from ocean to ocean, and a railroad is now being built across it via San Jose, the capital. Other enterprises of magnitude have been projected or are in contemplation, showing that the spirit of enterprise pervades the popular mind.

contribution. Our readers will recollect an interesting letter from his pen in this journal a few months since. In another column of this issue will be found some remarks on the mines of Costa Rica gathered from Mr. Gaertner, who is now in the city on business for the Costa Rica Exploration Company, which, completed, he returns to the theater of his duties and labors.

A Million-Dollar Fire.

One of the most disastrous conflagrations which ever visited San Francisco broke out about noon, on Sunday last, in the sash and blind factory of Day, Huber & Crocker, on Main street, near Howard. Property to the amount of fully one million of dollars was destroyed.

Among the heavy sufferers was the National Iron Works, corner of Main and Howard streets, owned by L. C. Marshutz and T. G. Cantrell. This company was very extensively engaged in the manufacture of steam engines, flour, sugar, saw and quartz mill machinery. They employed about 200 men. Their extensive plant of machinery was totally destroyed. We have not learned the amount of loss or of insurance, but we understand that there will be no cessation of business by their firm.

Other shops in the vicinity have generously tendered them whatever assistance they may need in filling the orders already on hand, and they are also prepared to receive orders for work, which will be as faithfully and promptly executed as though there had been no interruption. The California Machine Works, William H. Birch & Co., were not seriously damaged by fire as reported in the daily papers. There has been no interruption to their business whatever.

The total number of men thrown out of employment by this fire is about 1000; but many, if not a majority, of those engaged in the places of business destroyed will find work elsewhere until new buildings and shops can be erected, or in other shops beyond the limits of the fire to which business will go temporarily.

"Deevy" Wheeled Scrapers.

The form of earth-scraper known as the "Deevy" Wheeled Scraper, as shown in the accompanying cuts, was devised after more than two years of thorough practical experimentation, and embodies certain improvements not heretofore brought to notice.

Among the improvements in this machine it is claimed that they are more easily handled than any other form of scraper—one man being able to fill and dump the largest size as easily as two men can fill and dump any other style; that they will carry more cubic feet of earth than any other of similar size; and that they are more simple in construction, have fewer parts, and are consequently less liable to require repairs.

They are designed to withstand rough usage. The wheels are of wrought steel and iron, with wide tires, and need not be removed to oil the hubs. They will stand the exposure of every climate, as they have no wooden wheels to swell and shrink and decay. The tongue irons are built of double the usual strength of other styles, and the axles are correspondingly heavy. They are for sale by the Joshua Hendy Machine Works, Nos. 39 to 51 Fremont street, San Francisco, Cal., who are sole manufacturers in the Pacific States and Territories.

SHOULD BE STATED.—In our description of the improved four-sided molding machine, which appeared with illustrative cut in our last issue, it should have been stated that the agents for these machines for this coast are Messrs. Tatum & Bowen, 34 Fremont street, San Francisco, to whom we are indebted for cut.

CORRESPONDENCE.

We admit, unadvised, opinions of correspondents.—EDS.

Calaveras County Mines.

EDITORS PRESS:—The excessive heat is telling on the water supply of this section. To provide against a shortage in the future, the Union Water Co. is building an additional reservoir, which will store sufficient water for mining and irrigation in the section covered by the ditch. This water system was constructed in the early mining days to wash the placer claims. To reach these, distributing ditches were run on almost every mountain in this vicinity. Now that the quartz veins in these hills are being opened and their value proven, it is only necessary to drop a pipe down the mountain-side to the gulch below to obtain a fall for pressure of 300 feet or more. The great value of this condition in enabling the ore of this vicinity to be worked cheaply is not fully appreciated by the residents, though the fact that Mr. A. Hayward of Angels is constructing a six-mile ditch from a point just below Murphys to a hill opposite Angels, from which point he will pipe three miles to his mine in Angels to obtain 135 feet fall, shows by contrast in expense of obtaining power the natural advantages of this section.

On the Stanislaus river, Senator Dorsey's mines are considered "good enough to keep" and so are idle. "Lex" Johnson is driving ahead some 150 feet on his lode with a good showing. Uncle Tom Goodwin has not reported of late, but his various prospects are reported good.

Mr. Hallock, the inventor of the Robison process, has taken hold of the Collier mine, and once he gets in operation proposes subduing the rebellious but high-grade ore of this mine. Just below the Collier, Messrs. Josselyn & Lake of S. F. have resumed operations on the Cataract and Wide West hydraulic claims, their first mine being a location of 3500 inches of water on the Stanislaus. Mr. Buck is in charge. These claims cover large beds of rich gravel, and under proper management must prove all that their owners can desire.

Further south, the Mitchell gravel claims have put in a centrifugal pump of sufficient capacity to drain the "flat." The surface of this "flat" was worked over in early mining days, but the large gravel-beds below water level were scarcely touched. Various Californians have endeavored to get hold of these valuable mines, but litigation shut them out. Now, however, this obstacle has been removed, and the "flat" will be made to give up its store of gold. That it is there, and that in abundance, is easily proved.

The writer this week saw a miner, who works an adjoining claim, exchange about \$3000 of gold dust at one time, as the result of his clean-up. Chase & Pray have stopped their hydraulic till the water supply increases, as have also the Central Mill Co. Once these claims consolidate and obtain the dump of the one and high head of water on the other, they will have as good a property as they could wish.

Our miners are not troubled on account of their sloth, the tailings being free from pipe clay; the ranchers convey the tailings on to worked-out gravel claims, filling up the gulleys and covering the stone-piles, thus restoring what the early miner took away. In quartz, the Esmeralda is sinking an additional 100 feet with the vein now five feet wide; a hoist of one-ton capacity is being erected. The woods in the vicinity of the mine are full of prospectors and a number of locations each week is the result.

Cunliff & Driver are driving ahead on their Heroules mine and are now down 150 feet—16 feet vein. Sublett & Cutting, just out of Murphys, are drifting on "No. 3," are down 70 feet and have drifted the same distance. This mine is one of those "soft things" that seldom fall to the prospector's lot. While the owners keep quiet, it is known that "it's loney with gold," Sublett is driving the drift alone, taking out in coarse gold 15 ounces of gold the past week with every evidence of a bonanza ahead. May it stay by them!

The May Flower, now the property of S. F. Penlies, has been opened by shaft tunnel 40 feet, and from the crosscut drifts now 100 feet east and west on the vein into the hills on each side. They are now sinking, and a good hoist pump is contemplated. When these gentlemen came into the section the usual gang of black-mailers, that infect every mining camp, took them in hand and so discouraged them that they were almost persuaded not to go and look at the mine. Since taking possession, they have repeatedly been assured of their ultimate failure, but every stroke of the drill and pick has served to convince them that they have "a good thing," and they mean to stay by it. All the prospects of this section want is depth; the average of the present shafts is ten feet. Wherever these claims have been taken hold of and put down, they have shown increasing width and richness.

This field is as Angels was but a few years ago; then a quartz claim was looked upon as poor property, but when Mr. Hayward and others came into camp, put down their money and their shafts, the whole aspect changed, and to-day the old prospect-holes are eagerly bought up, the shaft put down, and one good mine after another added to the list in boom-

ing Angels. To the man of sufficient means I would say, "Come to Murphys. Select your prospect and go down or in on it, and obtain a good mine for little more than the cost of development in a section where ore can be worked for from \$1.50 to \$2.50 a ton." *Murphys, Cal.* E. H. SCHAEFFLE.

Mineral Resources of the United States.

Results of Work in 1887.

[By DAVID T. DAY, Chief of Division of Mining Statistics and Technology, U. S. Geological Survey.]

Metals.

Iron.—The principal statistics for 1887 were: Domestic iron ore consumed, about 1,300,000 long tons; value at mines, \$33,900,000. This is an increase over 1886 of 1,300,000 tons in quantity and \$5,900,000 in value. Imported iron ore consumed, 1,194,301 long tons; total iron ore consumed in 1887, about 2,494,301 long tons, or 1,454,868 tons more than in 1886. Pig iron made, 6,417,148 long tons; value at furnace, \$121,925,800. This is an increase over 1886 of 733,819 tons in quantity and \$26,730,040 in value. Steel of all kinds produced, 3,339,071 long tons, an increase of 776,569 tons over 1886; value at works, \$103,811,000. Total spot value of all iron and steel in the first stage of manufacture, excluding all duplications, \$171,103,000, an increase of \$28,603,000, as compared with 1886. Limestone, used as flux in the manufacture of pig iron in 1887, about 5,377,000 long tons; value at quarry, about \$3,226,200.

Gold and Silver.—The total value of gold produced in 1887 was \$33,100,000, a decrease of \$1,900,000 from 1886. Silver increased from \$51,000,000 in 1886 to \$53,400,000 (coinage value) in 1887.

Copper.—Total production 184,670,524 lbs., of which 3,750,000 lbs. were made from imported pyrites. The total value was \$21,052,440, at an average of 11.4 cents per pound. The estimated total consumption of copper in the United States increased by about 14 per cent.

Lead.—The production of lead was 160,700 short tons, valued at \$14,463,000 at \$90 per short ton. The heavy increase of "desilverized" lead from 114,829 short tons in 1886 to 135,552 in 1887 was probably due to the importation of Mexican lead-silver ore. The large product of non-argenteiferous lead, 25,148 short tons, is due chiefly to the development of the Saint Joe district in Missouri. The production of white lead, and the several oxides, from pig lead increased to a total of about 75,000 short tons.

Zinc.—The producers' returns show an increase from 42,611 short tons in 1886 to 50,340 in 1887. The price increased to 4½ cents per pound, making the total value in 1887, \$4,782,300. The production of zinc oxide was practically steady at 18,000 short tons, valued at \$1,440,000.

Quicksilver.—Production and value increased from 29,981 flasks, valued at \$1,060,000, to 33,825 flasks valued at \$1,429,000. Except 65 flasks from Oregon the total supply came from California. The price in 1887 varied from \$36.50 to \$45 per flask in San Francisco.

Nickel.—The supply includes 183,125 pounds of metallic nickel, valued at \$117,200; 10,846 pounds of metallic nickel contained in matte, and 11,595 pounds contained in nickel ammonium sulphate. Total value, \$133,200.

Cobalt Oxide.—The product includes 5769 pounds of cobalt oxide for potter's use, and 12,571 pounds of oxide in matte exported to Europe. Total value, \$18,774.

Chromium.—Shipments from California increased to 3000 long tons on account of better freight facilities by rail to the Eastern States. Total value in San Francisco was \$40,000.

Manganese.—The total production of manganese ore in the year ending December 31, 1887, was 34,524 long tons, valued at \$333,844. The production of manganiferous iron ore was 211,751 tons, valued at about \$600,000. The production of argenteiferous manganese ore was 60,000 tons, valued, chiefly for its silver, at about \$600,000.

Antimony.—The production, all in California, was 75 tons, valued at \$15,500. This is an increase from 35 tons in 1886, valued at \$7000.

Aluminum.—The production of aluminum bronze containing 10 per cent of aluminum increased to 144,764 pounds in 1887, valued at \$57,905. Other alloys, principally of iron and aluminum, amounted to 42,617 pounds, worth \$17,000.

Platinum.—Considerable search by dealers produced 445 ounces of crude platinum, valued at \$1838. Part of this came from British Columbia.

Fuels.

Coal.—The total production of all kinds of commercial coal in 1887 was 123,965,255 short tons (increase over 1886, 16,283,046 tons), valued at the mines at \$173,530,996 (increase, \$26,418,241). This may be divided into Pennsylvania anthracite, 39,506,255 short tons (increase, 2,809,780 short tons), or 35,273,442 long tons (increase, 2,508,732 long tons), valued at \$79,365,244 (increase, \$7,807,118); all other coals, including bituminous, brown coal, lignite, small lots of anthracite produced in Colorado and Arkansas, and 6000 tons of graphitic coal mined in Rhode Island, amounting in the aggregate to \$4,459,000 short tons (increase, 13,473,266 tons), valued at \$94,165,752 (increase, \$18,611,123).

The colliery consumption at the individual mines varies from nothing to 8 per cent of the

total output of the mines, being greatest at special Pennsylvania anthracite mines and lowest at those bituminous mines where the coal-bed lies nearly horizontal and where no steam-power or ventilating furnaces are needed. The averages for the different States vary from 2.1 to 6.1 per cent, the minimum average being in the Pennsylvania bituminous and the maximum average being in the Pennsylvania anthracite region.

The total output of the mines, including colliery consumption, was: Pennsylvania anthracite, 37,578,747 long tons (increase over 1886 2,725,670 long tons), or 42,088,197 short tons (increase, 3,052,751 short tons); all other coals, 87,837,360 short tons (increase, 14,129,403 tons), making the total output of all coals from mines in the United States, exclusive of slack coal thrown on the dumps, 129,925,557 short tons (increase, 17,182,154 tons), valued as follows: Anthracite \$84,552,181 (increase, \$8,433,061); bituminous, \$97,939,656 (increase, \$19,458,600); total value, \$182,491,837 (increase, \$27,891,661). The above figures show a notable increase in 1887 over 1886 in the aggregate output and value of both anthracite and bituminous coal.

Coke.—The total production of coke in the United States for the year ending December 31, 1887, was 7,857,487 short tons, valued at \$15,723,574. This is the greatest product ever reached in the United States, being 1,022,419 tons greater than in 1886.

Petroleum.—Total production, 25,249,543 barrels of 42 gallons each. The total value, at an average of 60 cents, was \$16,949,726. The increase over 1886 was very slight, only 139,428 barrels. There was a decrease of 1½ cents per barrel in the average price.

Natural Gas.—The production of natural gas in the United States in 1887 was equivalent to 9,055,000 short tons of coal displaced. This, at an average value of \$1.50 per ton, would make the value of the coal displaced by natural gas (which is the measure of the value of the gas) \$13,582,500. In 1886 the corresponding quantity was 6,353,000 tons, worth \$9,847,150.

Structural Materials.

Building Stone.—Direct returns from producers show a total value of \$25,000,000. This marked increase shows that the statement for 1886 was too small.

Brick and Tile.—Value, \$40,000,000. This represents an increase of about 13 per cent in the production of brick and a decrease in tile, owing to the drought in 1887 in Indiana and Ohio. Prices were slightly lower.

Lime.—The production is estimated at 46,750,000 barrels, with an average value of 50 cents per barrel.

Cement.—The production of cement from natural rock was 6,692,744 barrels, valued at 77½ cents per barrel, making \$5,186,877 as the value of a year's product.

Abrasive Materials.

Bluish stones.—The value of the total product is estimated at \$200,000.

Grindstones.—In Ohio and Michigan 37,400 tons were produced, valued at \$224,400.

Corundum.—Total production from North Carolina and Georgia 600 short tons, with a spot value of \$108,000.

Novaculite.—Production 1,200,000 pounds, valued in the rough state at \$16,000.

Infusorial Earth.—Maryland produced 3000 short tons, worth \$15,000. A small quantity was produced in Nevada and in New Mexico.

Miscellaneous.

Precious Stones.—The value of American gems in the rough state amounted to \$88,600, besides gold quartz for specimens and gems, valued at \$75,000.

Phosphate Rock.—South Carolina phosphate rock, 480,558 long tons, valued at \$1,836,818; an increase of 50,009 tons, but a decrease of \$36,118 in value, due to greater competition, reducing the price to \$3.75 per ton for land and \$4 for river rock.

Marls.—In New Jersey the production is estimated at 600,000 tons, worth about \$300,000. While the New Jersey marl is yielding slowly to commercial fertilizers, the Virginia marls, as well as those in North and South Carolina, Georgia, Mississippi, and Florida, are finding increased local use.

Salt.—Production in 1887, 7,831,962 barrels (of 280 pounds), value \$4,093,846. The annual production has increased each year since 1883, but the total value has declined, being less in 1887 than in 1884, although only 6,514,937 barrels were made in that year.

Bromine.—Stocks accumulated in 1886 and reduced the output of 1887 to 199,057 pounds, valued at \$61,717. The price was held at 31 cents per pound.

Borax.—Production, 11,000,000 pounds, all from California and Nevada. Total value, \$550,000, at 5 cents per pound for the average grade. The price was rising at the close of 1887.

Sulphur.—Production about 3000 tons from Utah, worth \$100,000. Litigation checked the use of an increased plant. The imports of Sicilian sulphur, with small shipments from Japan, were 96,882 long tons, valued at \$1,668,360.

Pyrites.—Production 52,500 long tons, valued at \$210,000, at \$4 per ton at the mines.

Barytes.—The production increased to 15,000 long tons of crude barytes, valued at \$75,000 at the mines.

Gypsum.—The condition of the industry is practically unchanged. The estimated total product was 95,000 short tons of crude gyp-

sum, valued at \$425,000. In addition, 162,154 long tons of crude gypsum were imported, chiefly from Nova Scotia.

Mica.—The production increased to 70,500 pounds, valued at \$142,250. The increase was chiefly in North Carolina. New Hampshire, Massachusetts, and Virginia also produce mica. No shipments were reported from the Black Hills or New Mexico. The use of mica waste is increasing; 2000 tons, worth \$15,000, were ground in 1887.

Feldspar.—The amount consumed, principally by potters, was 10,200 long tons, valued at \$36,100 before grinding. This includes freight to the principal markets, Trenton or New York. The consumption in 1886 was about 5000 tons less than the production returned by quarrymen.

Flint.—For pottery 19,800 tons were used. Including the use for sand-paper and in glass manufacture, the total consumption was about 32,000 tons, worth, on ground, \$155,000.

Potter's Clay.—The consumption of kaolin and ball clay by potters aggregated 28,000 tons, valued at \$290,000. In addition, the potters used 15,000 tons of fire-clay, worth \$50,000.

Asbestos.—The total product hardly exceeded 150 tons, worth \$4500. In addition, several hundred tons of fibrous actinolite were used for weighting paper.

Mineral Paints.—Including ochre, metallic paints, and small quantities of umber and sienna, the production amounted to 20,000 long tons, selling for \$310,000 at the mines.

Graphite.—The production at Ticonderoga is reported as unchanged. Small lots ranging from graphitic clay to pure graphite were produced in North Carolina. Total production, 416,000 pounds, worth \$34,000. This does not include 500 tons of impure graphite mined in Rhode Island for foundry facings.

Fluorspar.—The production remained constant at 5000 tons in Indiana. The total value was \$20,000.

Mineral Waters.—The product which was sold amounted to 8,259,609 gallons, worth \$1,261,473.

Totals.—The following tabular statement shows an aggregate value of \$538,056,345 for the year. This is the largest total ever reached by the mineral industries of any country. It is nearly \$73,000,000 more than the product of the United States in 1886 and considerably more than \$100,000,000 in excess of the year 1885. Of many items which have contributed to this result it will be noted that all the metals increased in quantity, except gold and the minor metal, nickel, and nearly all increased in price. The significance of this is seen in the increase in production of the fuels necessary for reducing these metals and preparing them for use. All of these fuels, including natural gas, show a marked increase. The increased value of building-stone is principally due to a more careful canvass of this industry than has been possible in previous years. It is not probable that the great total recorded for 1887 will be equaled in the present year, 1888.

METALLIC PRODUCTS OF THE UNITED STATES IN 1887.

	Quantity.	Value.
Pig iron, spot value, long tons...	6,417,148	\$121,925,800
Silver, coinage value, troy ozs....	41,260,240	\$3,441,300
Gold, coinage value, troy ozs....	1,536,500	\$3,100,000
Copper, value at N. Y. City, lbs. 184,670,524	184,670,524	21,052,440
Lead, value at N. Y. City, short tons	160,700	14,463,000
Zinc, value at N. Y. City, short tons	50,340	4,782,300
Quicksilver, value at S. F., flasks	33,825	1,429,000
Nickel, value at Philadelphia, lbs.	205,566	133,200
Aluminum contained in alloys	74,006
Antimony, value at S. F., short tons	75	15,500
Platinum, value (crude) at N. Y. City, troy ounces	448	1,838
Total.....		\$250,419,283

NON-METALLIC MINERAL PRODUCTS OF THE UNITED STATES IN 1887 (SPOT VALUES).

	Quantity.	Value.
Bituminous coal, long tons.....	78,426,214	\$97,039,656
Pennsylvania anthracite, long tons	37,578,747	\$84,552,181
Building stone.....	25,000,000
Lime, barrel.....	46,750,000	23,375,000
Petroleum, barrels.....	25,249,543	16,949,726
Natural gas.....	6,692,744	13,582,500
Cement, barrels.....	7,831,962	4,093,846
Limestone for iron flux, long tons	5,377,000	3,226,200
South Carolina phosphate rock, long tons	480,558	1,836,818
Zinc-white, short tons.....	15,000	1,440,000
Mineral waters, gallons sold.....	8,259,609	1,261,473
Borax, pounds.....	11,000,000	550,000
Gypsum, short tons.....	95,000	425,000
Manganese ore, long tons.....	34,524	333,844
Mineral paints, long tons.....	20,000	310,000
New Jersey marl, short tons.....	60,000	300,000
Pyrites, long tons.....	52,500	210,000
Flint, long tons.....	32,000	185,000
Mex. pounds.....	70,000	142,250
Sulphur, short tons.....	0	108,000
Precious stones.....	3,000	100,000
Crude barytes, long tons.....	15,000	75,000
Gold quartz, souvenirs, jewelry, etc.....	75,000
Bromine, pounds.....	199,057	61,717
Feldspar, long tons.....	10,200	56,100
Chrome iron ore, long tons.....	3,000	40,000
Graphite, pounds.....	416,000	34,000
Fluorspar, short tons.....	5,000	30,000
Slate, ground as pigment, long tons	2,000	20,000
Cobalt oxide, pounds.....	18,340	18,774
Novaculite, pounds.....	1,200,000	16,000
Asphaltum, short tons.....	4,000	16,000
Asbestos, short tons.....	150	4,500
Rutil, pounds.....	1,000	3,000
Total.....		\$281,637,062

RESUME OF THE VALUES OF THE METALLIC AND NON-METALLIC MINERAL SUBSTANCES PRODUCED IN THE U. S. IN 1887.

Metals.....	\$250,419,283
Mineral substances named in the foregoing table.....	281,637,062
Total.....	\$532,056,345
Estimated value of mineral products unspeci-	
fied.....	6,000,000
Grand total.....	\$538,056,345

SAN FRANCISCO

Saturday Morning, Sept. 15, 1888.

TABLE OF CONTENTS.

EDITORIALS.—Progressive Costa Rica; A Million-Dollar Fire; "Deevey" Wheeled Scrapers, 173. Passing Events; The Secret of Their Success; Mining in Fresno County; The Tariff on Leads, 176. American vs. English Shipbuilding; Projected Building of this San Francisco Cremation Company, 177.

ILLUSTRATIONS.—The "Deevey" Wheeled Scraper, 173. Projected Edifice of the San Francisco Cremation Company, 177.

CORRESPONDENCE.—Calaveras County Mines, 174.

MISCELLANEOUS.—Mineral Resources of the United States, 174. The Russell Process; The Air in Coal Mines, 175.

SCIENTIFIC PROGRESS.—Photographing a Thunderbolt; What is Latent Heat; An Interesting Experiment with Water; The Coldest Spot on Earth; A Gloomy View of Modern Civilization; A Curious Phenomenon; A Marble Tablet, 178.

MECHANICAL PROGRESS.—Important Improvements in Pipe Joints; How to Secure Clean Castings; New Hydraulic Tube Press; An Alloy for Cold Soldering; The Castner Sodium-Aluminum Processes; New Tin Plate Machinery; Giant Hydraulic Presses; Flaws in Steel; Experiments with Sheet Copper; More Locomotive Working in Hot Water; Something New in the Mechanical Treatment of Leather, 178.

GOOD HEALTH.—Use and Abuse of the Brain; Celery for Rheumatism; Medicinal Value of Buttermilk, 179.

USEFUL INFORMATION.—The Manufacture of Mortar; Useful Colors; The Oil Rocket as a Defense Against Shipwreck; Cultivate the Use of the Left Hand; Fish Living in Hot Water; Economy in the Use of Sugar; The California Lion; Sawdust for Fuel, 179.

ENGINEERING NOTES.—The Oscillations of High Chimneys; Testing for Foundations; Direct Connection; A New Principal in Propulsion; A Canal Across Italy; Water for Paris, 179.

MINING SUMMARY.—From this various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 180-21.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 184.

Passing Events.

More phenomenal weather has occurred on the coast during the past week. On Sunday we had a good sprinkling of rain which extended over a wide portion of the State, being the first precipitation of the season. On the 11th inst. a hot wave such as has never before been experienced swept over the city, this sultry blast having been preceded by a high wind that brought with it a dust-storm and followed by a smart shower which equalized the temperature and put an embargo on the dust.

Field and forest fire continue frequent in the interior of the State, some of them causing much damage.

On Sunday last a fire broke out in the lower part of San Francisco, and, sweeping over several blocks, proved the most destructive that has occurred in the city for some time past. Total loss, \$1,000,000, with but little insurance.

THE U. S. revenue cutter Bear arrived in port from the Arctic on the 6th instant, bringing news of a terrible storm which occurred Aug. 3d in the vicinity of Point Barrow, wrecking five vessels of the whaling fleet and damaging many others. The Bear had on board 109 seamen belonging to the lost vessels.

The Secret of Their Success.

The means by which certain operators in mining stocks manage to achieve an almost uniform success is to the many who fail cause for perpetual wonderment. Just now, when this branch of our "home industries" is so nearly paralyzed that we cannot, in remarking upon it, be suspected of trying to bull or bear the market, there being no market, is a good time to explain so far as may be the methods by which such success is reached; that is, as seen from our standpoint of view. It may, indeed, seem presumptuous, for one who has had so little experience in this branch of business, to essay a task of this kind, the writer never having gambled in these nor any other class of "securities"—never, in fact, knew the name of a card in his life. Nevertheless, it has so fallen to our lot that we have now and again been called upon to examine into this subject with such fitness for the work as has been vouchsafed us.

Let it be premised, then, that the present season of depression, the situation to the outsider seeming irretrievably desperate, is not regarded by the veteran professional, who well knows that this is according to the order of nature—knows that the resting and recuperative winter must precede the growing and maturing summer. This is his seedtime; the harvest will come by-and-by, when he who has industriously sown and patiently waited shall reap an abundant harvest. Now, therefore, when the bottom has gone out of the market and prices have fallen below zero, he proceeds to load up with mining shares, selecting only such as he has reason to believe will at some future time command a good price. But he goes about this quietly, picks up through his agents small lots here and there as opportunity offers; for until he has gathered in what he wants it is not his policy to "boost" the market. Indeed, while this gathering is going on everything possible is done to depress prices, at least of these particular stocks.

In so loading up the experienced speculator is not governed so much by the intrinsic value of the shares selected as by certain combinations made, or which he knows are to be made, to insure for the same a future market at good prices. How this is to be brought about, although not exactly a trade secret, forms an essential part of the business, which, it is needless to say, is conducted with system and exactness. It is not left to run itself, nor are outsiders permitted to run it, however much they may sometimes think they do so.

A buoyant mining-share market cannot, as some people suppose, be made to order, nor can its advent be much hastened through recourse to purely fictitious means. Its success, and even its possibility, are largely dependent on the existence of favorable conditions. The astute manipulator knows as well as the practical dairyman that milking-times must not be too frequent; he therefore awaits patiently the opportune season for repeating the process.

It might be thought that combinations formed for so making and controlling a mining share market would find their load a heavy one to carry by reason of the many assessments apt to be levied on their large holdings. Not at all—when it comes to paying their due, these fortunate parties are found to hold but few assessable shares. When it comes to voting or receiving dividends, they are found to hold always a good many. These wily people are not apt to load up with a stock till the annual assessment has been paid, and, as the yearly election approaches, they manage to borrow enough shares to re-elect their own board of trustees, and so continue the management in their own hands.

Now if any one thinks a business like this can be organized and carried on without money, nerve and skill, he is much mistaken. The men who combine for such purpose possess all these and a good deal more, manifesting often a tact, patience and care not always shown by those engaged in a more legitimate calling. They do not, like the dabbler in stocks, become panic-stricken, and let go just when they ought to hold on. They reverse the policy of the inexperienced "chipper-in," huying when others sell and selling when others buy, the secret of their success lying in their ability to do so. The men who form these associations do not become alarmed at a break in the market, and, like the multitude of small speculators, scurry away like a flock of scared sheep, which, once started,

rush headlong one way, even though it lead over a precipice.

To the investor of small means we would say avoid stock dealings altogether. This we tender as the best advice we can give him. If, however, he is bound to tempt fortune in this perilous field of adventure, then he had better lay aside everything else and devote his time, means and energies wholly to it. If he have aptitudes for the business, and is able to form an advantageous alliance, he may in the end achieve a success, though it will certainly cost him much hard work and possibly come twinges of conscience, if he have any.

Death of Proctor.

Richard A. Proctor, the famous astronomer, died Sept. 12th at the Willard Parker Hospital, New York City, of yellow fever. It is with great surprise we make this announcement, as he was a sturdy Englishman in the prime of life. He had been spending a few weeks with his family at Oaklawn, Marion county, Fla., where he had an observatory and one of the loveliest homes in the South. As he had not been near Jacksonville, it is difficult to explain how he contracted the contagion. He was on his way to England, and had secured passage on the steamship Umbria. While at the Westminster Hotel, where he had been in the habit of stopping the last 10 or 12 years, he complained of feeling fatigue and of indisposition. He went directly to his room and sent for a physician. As his symptoms were mysterious he was kept in isolation. Last Tuesday morning he grew worse, and the symptoms were such that it was thought best to send him to the hospital, where he soon succumbed to the yellow fever.

Richard Anthony Proctor was born on the 23d of March, 1837, at Chelsea, but having had health in his boyhood was chiefly educated at home. He pursued his studies afterward at King's College, London, and St. John's College, Cambridge, graduating in 1860 as twenty-third wrangler. In 1866 he was appointed a Fellow of the Royal Astronomical Society, and seven years later an honorary Fellow of King's College. He became honorary secretary of the society and editor of the Journal of Proceedings in February, 1872, but resigned the offices about one year later. He had carried out a series of original researches, analyzed results collected by the astronomers Herschel, Struve and others, and constructed a chart of 324,000 stars, which led him to a new theory of the structure of the stellar universe. He investigated also in 1874 and in 1882 the transits of Venus, and published many illustrative charts. In 1869 he maintained on theoretic grounds the since established theory of the solar corona, and also the inner complex solar atmosphere, afterward discovered by an American astronomer named Young. The deceased was the author of a number of astronomical works which are rated as standard publications. In 1879 he came to America and Australia, lecturing in all the principal towns of the colonies, and in 1881 started *Knowledge* as a weekly journal, but in 1885 changed it to a monthly.

He was a versatile writer and wielded a vigorous pen, being the author of over 60 books. Among his best-known works are "Saturn and Its System," "Handbook of the Stars," "Other Worlds Than Ours," "Half-Hours With the Telescope," "Light Science for Leisure Hours," "Borderland of Science," "Elementary Astronomy," "The Sun," "Transits of Venus," besides his universally admired "Atlas of the Stars."

The articles on astronomy in "Appleton's Encyclopedia" and the "Encyclopedia Britannica" were his works. He also has been for a number of years an industrious contributor to several magazines. He had constructed a chart of the heavens, and in 1874 added greatly to his reputation by his learned and important researches into the transits of Venus.

He was well known in this country as a lecturer, and though his manner was a little stiff and his style heavy with redundancy, still he abounded in vivid and striking illustrations, and was very popular.

He lost his first wife in January, 1879. The present Mrs. Proctor, who is a niece of General Jefferson Thompson of Virginia, married him in May, 1881. She is a lady of rare culture and very rich in her own right. Last year he decided to become an American citizen.

The Tariff on Lead.

The New York *Financial and Mining Record* is pleased to express the opinion that the proposed reduction of the duty on imported lead from \$40 to \$25 per ton will not injuriously affect the lead-mining interests in this country. The lead miners and their friends, however, hold to a contrary opinion, contending that such reduction if carried out will not only hurt but that it will prove disastrous to that industry, and even in many instances destroy it altogether.

In considering a question concerning which one set of opinions so antagonize another, it is natural to inquire who would be most likely to have an intelligent understanding of the subject, parties living in the lead-producing districts and conversant with the conditions that there obtain, or parties living on the Atlantic seaboard, thousands of miles away from those districts, and who can, of their own personal knowledge, know little about the business. The answer to such inquiry is obvious. The lead-producing people must themselves be the better authority. They have opportunities to acquaint themselves with the situation—to learn the conditions of the business and the wants of those engaged in it which the stranger has not.

But, apart from this aspect of the question, to what end, let us ask, this proposed reduction in the duties on lead imported from abroad? It can have but one object, viz., reduction of the cost of this article to the consumer. But considered in the long run, will it effect that end? We do not think it will, as much of our past experience tends to establish.

In every instance where these domestic industries for the use of which we produce the raw material have been duly protected against foreign competition, the products of these industries have in the end been cheapened. Their prices, advanced perhaps a little at first, while these various branches of business were being established, have afterward gradually declined, being forced down by home competition. This has been true of our agricultural, our mechanical, our mining, in fact of all our industries, manufacturing included.

On this coast, copper, quicksilver, salt, lead, borax, wool, wine, fruit, in short every pursuit made possible in the first instance only through the protection extended to it, serves to illustrate, while it proves the soundness of our argument. Ever since these several industries gained a permanent foothold, the commodities here named have steadily tended to lower prices, until they have at last reached the lowest figures compatible with the continued existence of these industries. In nearly every case these articles are supplied to the consumer at as low a figure as they could be were they imported from abroad.

If this be so, says the objector, if we can make these things as cheaply as they can be made in other countries, what need for imposing a duty on their importation? Simply this, to enable our own manufacturer to build up and establish his business and afterward secure to him the home market. This, in a few words, comprises the whole argument.

There is, however, another factor of the case, and one which, strange to say, has by both parties to this controversy been treated as inconsequential or wholly overlooked. It seems to have been forgotten that here in the United States we are receiving every few years a million people from Europe and other over-populated countries. For these people we are expected to provide employment, very few of them being able to become self-employers. Not ten per cent of these immigrants have means to settle on the land or go out into the mines of the far West and there make a living. Labor, therefore, must be furnished for them, mechanical and manufacturing pursuits being those most available to that end. This being the case, we may well seek to protect this class of industries against foreign competition, for it cannot be expected that we will receive the surplus labor of these countries and the product of the cheap labor they retain at home as well. This makes our case exceptional: we are not exporting labor to other countries, but receiving it from all. The whole world is emptying its superfluous population on us; and to this we do not object if only they will abstain or can be prevented from flooding our country with the products of the ill-rewarded labor of these over-peopled lands. This is an element of the labor and protection problems that seems to have received too little consideration.

American vs. English Ship-Building.

An opinion seems to have gained quite general prevalence on both sides of the Atlantic that our people are quite behind the English and Scotch in ship-building affairs. But a little examination into the matter will satisfy any impartial mind that the fact is quite the reverse.

It was not long since remarked by a New York journal that at that time there were in the harbor of New York two steamships which were likely to revolutionize sea and river navigation. They were the City of New York, presumed to be the best product of English naval ingenuity, and the Monmouth, an American ship built on the Delaware, for service between New York and Sandy Hook, a distance of about 20 miles. Both have two screws, and both have triple expansion engines. The wonderful speed that was then expected of the City of New York has not been realized. She has just been beaten in the great ocean race. Her failures may possibly be due to the newness of her

war ships was created by Congress, which inquired fully into the matter of building war-ships. The evidence collected showed quite conclusively that the English ship-builder had no decided advantage over the American, either as to price or skill. There are many differences in methods of construction; but the materials of the American ships average better throughout. The workmanship is better, the outfit is more complete, and the accommodations for both officers and men are superior. It is possible that the English ship of the same class and tonnage might be built a little cheaper, but it would be at the sacrifice of the many points of superiority which are found in the American ship. During his examination before the committee, Mr. Cramp, the great American ship-builder, said:

"For a high order of work there has not been a great difference in prices between us and the English ship-builders. We would be glad and willing to build at the rates the Cunard people have been giving for their ships. They always give big prices and have the best builders. We

City of New York, and then we shall know what speed and comfort are.

Mr. Cramp is also authority for saying that American ship-joiners are the best in the world, and as an evidence of the truth of this assertion he said that one of the leading master ship-joiners of New York had been time and again solicited to go to England and take charge of the joiner work for some of the English crack ships.

The New York Sun, in speaking of the progress which has lately been made in ship-building, says:

"About the only improvement of consequence made in marine vessels in the past 30 years has been in their machinery. The side-wheel steamships have disappeared. They are too expensive to compete with propellers, and, besides, too slow. What the ordinary propeller has done to the side-wheeler, the triple and the proposed quadruple and even quintuple expansion engines, attached to twin screws, will do to them. Speed and economy are the great objects of marine architects, and until some

consummation, the members confidently believe, notwithstanding our people, so distinguished for their advanced views and liberality, have not as yet extended to this enterprise the aid or encouragement that was to have been expected.

In reference to the new method of dealing with our mortal remains the society, through their circulars, makes the statement that they do not, at this time, propose to enter into details as to the merits of incineration further than to say that it is, through the whole civilized world, forging ahead with rapid strides as the most natural, practical, economical, safe, and, from a sanitary standpoint, the most desirable plan for disposing of the dead.

Cremation has now taken a strong foothold elsewhere in the United States, being successfully in operation in nearly all our large cities.

But besides the esthetic, economic and sanitary advantages of cremation, as above set forth, there is still another which, while it will have little weight with most people, is by others regarded as worthy of consideration and even as being of vital importance. It is held, then, by

PROJECTED EDIFICE OF THE SAN FRANCISCO CREMATION COMPANY.

machinery. But the American-built Monmouth has been in service about the same length of time and yet has shown such speed and economy of fuel as to fix the eyes of the maritime world on both sides of the Atlantic upon her in wonder and admiration. She burns but one-half as much coal as the ordinary side-wheel, walking-beam steamer running on the same line, yet she is much faster. It is claimed for her that she can easily average 18 miles an hour in ocean way. This would make her the fastest passenger vessel in the world with the exception of two or three of the trans-Atlantic greyhounds, which have shown greater speed in proportion to tonnage, but have cost two or three times as much, in proportion, to give them their great speed.

American yachts have again and again beaten the fastest English yachts. An American sailing ship, the Sovereign of the Seas, has made the greatest number of miles ever sailed in 24 hours. Nowhere in the world can there be found more splendidly equipped or faster river steamers than those upon our American inland waters. The same may be said of our coast-wise steamers. What has been said as to our advantage in speed and equipment is also true in regard to economy in fuel. Every one knows of the complete revolution which was introduced in naval warfare by the appearance of our iron-clads during our late civil war. The idea was conceived and carried into complete success by American builders and mechanics.

In 1836 a special committee on ordnance and

would like to fill our yard with the sort of work the Elders have been doing for the Cunard people at the same prices."

Mr. Cramp further stated that "he could build equally as good as theirs, and better as regards the accommodations for the comfort of those on board."

It further appears that the president of the Cunard Company once visited Mr. Cramp's yard, thoroughly inspected Mr. Gould's yacht, and stated that he was giving \$30,000 more to his English builders for a yacht for himself no better than Gould's.

Mr. Cramp further, in the course of the conversation, told the Cunard president that a large majority of the business of the Cunarders had been derived from Americans, and that it would be a compliment to their chief patrons to build one of their new ships here. He had offered to duplicate the Servia for the same price and guaranteed to heat her time across the ocean. This rather startled him, and he said the matter had never been presented to him in that light. But the Englishman took good care to have his last two vessels built on the Clyde. That was a *bona fide* offer from one business man to another. He wanted new ships, we wanted work, and every proposition that was made meant business. Mr. Cramp's firm still holds that offer open to Mr. Burns or anybody else. He will undertake at any time to duplicate any of the higher classes of English work at English prices. Some day perhaps we may have an American ship of the size of the

new and better method of propulsion for vessels is found, the compounding of engines and twin screws will be the favorite method. American mechanics are noted for their skill and ingenuity, and now they have turned their attention to the multiple expansion engines."

Projected Building of the S. F. Cremation Company.

We present herewith a cut of the building proposed to be erected by the San Francisco Cremation Company, the site selected for the same being the 50-vara lot on the corner of California and Laurel streets, two blocks beyond the terminus of the California Street Cable road. The architecture and general style of the edifice being sufficiently shown by the cut, it only remains in this connection to say that all the appointments of this beautiful structure will be in keeping with its exterior appearance. The society, which includes many of our leading citizens, is now taking steps to raise funds for erecting the projected building, and they hope soon to accomplish.

In their circular appealing to the public for aid, the society sets forth that there are now 98 shares at \$50 each subscribed and fully paid in, but a completion of the planned crematory will entail an expense of about \$25,000.

That the friends of enlightened progress in this community will furnish the funds required to enable the society to carry the noble work they have in hand to an early and successful

some, that the spiritual part of man cannot wholly escape from the physical until a complete dissolution of the latter has taken place. Hence, whatever hastens the disintegration of the material system is not only proper but highly desirable. By this class of progressionists recourse to embalming or other means for defeating or retarding the process of natural dissolution is condemned as being unphilosophical and cruel. Whether there be anything in this or not, certain it is the people who hold the doctrine are quite numerous, and, being all the advocates of cremation, will ultimately greatly strengthen the method.

In appealing to the public for financial aid the society does not make such claim on the ground of charity, being satisfied that all who give can, if they choose, realize great and lasting advantages from their benefaction. The cost of cremating a body will not at this institution exceed the sum of \$25, a great number of niches having been prepared in the walls of the edifice for receiving and keeping the ashes of those who undergo incineration.

The snowsheds a mile west of Truckee caught fire from a locomotive on the afternoon of the 7th. A watchman discovered it immediately and fire-trains from Truckee and the Summit soon arrived, but 1300 feet of sheds were burned up completely.

On Friday of last week the mercury at Yuma registered 132° in the shade—the hottest day there on record.

SCIENTIFIC PROGRESS.

Photographing a Thunderbolt.

Hitherto, we believe, there has been no success in the attempts at photographing a flash of lightning. If the exact locality and time of a thunderbolt could be known a minute beforehand, it might simplify the problem somewhat. But at any rate, the enterprise has been successful in one case. During a thunderstorm at Wakefield, Mass., on Saturday night, the 23d of June, Mr. A. H. Bidden, cashier in the office of the Boston Herald, succeeded in obtaining two good negatives of thunderbolts. From these he has developed some fine pictures, large and accurate in detail, and highly interesting as studies, both in the photographer's art and in natural philosophy. One shows a big bolt descending in a slightly zigzag shape, seemingly into the ground. A closer inspection, by the aid of a magnifying glass, discloses the appearance of a spiral motion. It seems to show that the bolt descended, in reality, spirally. This of itself is a fact of some interest and (it may be) of some importance. Doubtless the suggestion it involves will be aided by other experiments to demonstrate or disprove the seeming fact.

The other picture is still more curious. It reveals three principal bolts descending in different places, and a novel scene is disclosed in the shape of numerous thread-like streams of fire, connecting from both sides with each of the main streams. The resemblance to a number of large rivers, on a map, which shows also their numerous affluents, is so striking that it must impress every beholder. This triple blaze of lightning, descending in three widely separated bolts, seems to be visibly connected with a general "crinkling" development of the electric fire about all that part of the sky—a general flashing out of little bolts from the greater, and frequently almost at right angles with the main shaft.

These things no doubt occur in very many thunderstorms, but are not seen in their detail, owing to the swiftness of the movement. If the storm occurs at night, of course the exhibition is far more splendid, but the general impression received by the beholder is of a large and dazzling display of electricity in zigzag bolts and crinkling side-flashes that play against the dark background of the night sky in a manner too rapid to admit of discerning the details. This photograph reveals the details, and it is a surprising scene. Mr. L. B. Merriam of this city has a copy of both pictures. —*Hartford (Conn.) Times.*

What Is Latent Heat?

Heat has its equivalent in mechanical work, and when heat disappears work of some kind will be done to take its place. When a body changes from the liquid to the gaseous form the molecules have to be separated and placed in different positions with regard to each other. This calls for an expenditure of work. This work is supplied by heat which disappears at the time. One can hold his hand in steam escaping from the safety valve of a boiler for this reason. The heat of the steam disappears in pushing apart and rearranging the molecules of the steam as it expands when it leaves the safety valve.

The term latent heat, as commonly used, means the amount of heat which disappears when water changes from a liquid into steam. This is considerable, as will be seen by consulting any table of the heat contained in steam and the water from which it comes.

Water at 212° contains 180 units of heat. Steam at 212° contains 1146 units of heat. The latent heat is the difference of 966 units. Such a large quantity disappears when liquid water changes to steam that boiling water cannot be raised above 212° no matter how hard it is boiled. The heat becomes latent and the mechanical work, or rather molecular work, is sufficient to take up all that is supplied by the fire.

The specific heat of air at constant pressure being 0.2377, the specific heat of water, which is 1, is therefore 4.1733 times greater under ordinary circumstances. A pound of water losing 1° of heat, or 1 thermal unit, will consequently raise the temperature of 4.17 pounds, or, at ordinary temperatures, say 50 cubic feet of air, 1°. A pound of steam at atmospheric pressure, having a temperature of 212° F., in condensing to water at 212° F., yields 966 thermal units, which, if utilized, would raise the temperature of $5 \times 966 = 4830$ cubic feet of air 1°, or about 690 cubic feet from 0° to 70° F.

AN INTERESTING EXPERIMENT WITH WATER. The apparent paradox that the most transparent water is at the same time perfectly opaque from a certain point of view is shown by simple experiment. Partly fill a glass goblet with clear water, and hold it a little above the level of the eye and distant a foot or more. No object can be seen when held just over the surface of the water, but the water surface appears like a burnished mirror.

THE COLDEST SPOT ON EARTH is said by Lient. Schwatka during a late interview to be around the magnetic pole and not around the true pole of the earth. Hence the greater probability of there being an open sea about the north pole. The lieutenant found it 71° F. below zero at the magnetic pole. He further says: "There is a peculiar misunderstanding about such a low temperature in the scientific world. I remem-

ber reading in the *Popular Science Monthly*, which is supposed to be accurate, a statement to the effect that at 71° cold meat taken from a boiling pot will freeze solid before it can be put into the mouth. That is nonsense. Why, I have been naked in a temperature of 68° below. It was inside a snow hut as I took off my clothes and got into a sleeping-bag. It is the wind that plays the mischief with everybody; but, fortunately, the colder it gets the stiller it gets, and when it gets way down it's pretty quiet, I can tell you. But when you get back to the ordinary temperatures, then comes the torture. When I got on the whaler and began to get south I suffered excruciatingly, and thought I should suffocate; a fish out of water was nothing to it."

A Gloomy View of Modern Civilization.

In an address recently delivered in England by Prof. Huxley, he takes the ground that modern industrial activity and competition is simply a warfare carried on under the forms of peace, and that the men or the nations who secured victory in this warfare defeated their opponents by starvation. In other words, that all the new discoveries in the arts and sciences, by which processes or products of manufacture are improved or rendered cheaper, and which are generally regarded as blessings to mankind, are, in reality, simply additional or improved weapons by which the individual company, or nation who can control and make the best or exclusive use of such inventions or improvements, is enabled to more successfully carry on this warfare, and all the more easily and certainly inflict upon their competitors or opponents the penalty of defeat—starvation.

This address was delivered in support of a proposed institute in which it is intended to offer to the youth of England the best possible facilities for obtaining technical training and education. The idea advanced by the learned professor was that, this condition of war being recognized, it was necessary for England to secure for herself the best possible weapons for waging that war, and that one of the most effective weapons was to be found in technical education.

There is much food for thought in such a declaration, says the *American Machinist*, coming from such a source, and it would be a great satisfaction if we could deny its truth; but can we? And if we cannot deny its truth, then it becomes pertinent to inquire if a progressive civilization, which carries with it such results, is worth what it costs, and whether or not it can continue to progress, if, by its progress, it inflicts such a penalty upon those who are unable to attain the victory.

England has recently been meeting reverses in this industrial warfare, and the penalty of hunger has been suffered by many of her working people. Suppose that, by means of the improved weapon which Prof. Huxley speaks of, she regains her lost ground, will it not be at the expense of other industrial armies, composed of human beings, who have claims upon our sympathies?

Altogether it is a very gloomy view of the situation, but we have faith to believe that a better condition of things will be developed, and that civilization will eventually progress without the infliction of such a penalty upon those who may be surpassed in ingenuity and skill by their fellow-man.

We have no theory to advocate to bring about this condition, but we think that, for the best interests of mankind, such a condition must be brought about, and that in some way it will be.

A CURIOUS PHENOMENON is described by a correspondent of the *Germantown (Penn.) Telegraph* as having occurred at Vernon, Iowa, on the evening of July 12th, which was noticed with much interest by people for five miles around that place. The correspondent writes as follows: "The mercury in the middle of the day stood at about 86°. As evening approached a small luminous yellowish cloud arose out of the northwest and slowly floated away to the south. When sunset came the cloud was about west of us, and perhaps 30 degrees above the horizon, when the air became extremely warm, so much so that people became alarmed and wondered what was coming, some thinking they would die. This was all between sunset and dark, and right when the heat was most alarming a cold wind struck us from the northeast, and in a minute the heat and alarm were all gone, and the night was cool and pleasant to sleep. Now what was all that? Morse's geography of the last century tells us that in 1772 an electrical cloud passed over the island of Java and killed 1240 persons. Was our experience of the same kind as that of Java?"

A MARBLE TABLET recently found in an ancient sepulcher on the Via Portuensis, Rome, is apparently a work of the first century. It represents a naked youth, with long, disheveled hair, defending himself against two women, one facing him, and the other attacking him from behind. The women brandish weapons resembling lances in one hand, and a serpent winds itself around the other arm of each, and they seem as if about to sling them at the face of the youth. Archaeologists are puzzled to know what it is all about, but believe it represents the death of Pentheus, who was torn in pieces by Maenads on Mount Cithæron for having reviled the Bacchic mysteries.

MECHANICAL PROGRESS.

Important Improvements in Pipe Joints.

A new English invention of undoubted value, which may soon be manufactured in Pittsburg, is the patent wrought-iron pipe joint, invented by Mr. F. A. Williams, and manufactured in England, at the Britannia Tube Works, Wolverhampton. These joints are being worked under an intermittent pressure of 1200 pounds per square inch, and at various other English mining and engineering establishments they have been adopted with much success.

They are said to be especially suitable for petroleum pipe lines. A special virtue of the invention, which will probably do as much as anything to secure its popularity in America, is the fact that it is, in the words of the inventor, "the thing for petroleum pipe lines." In the first place, it may be attached to tubes of any thickness, and it can be made strong enough to stand any pressure. The makers claim also that the tubes are not weakened by having a thread cut upon them, and the joint can be connected in much less time than is needed to connect a screwed joint.

The method of connecting the tubes is by a slight angle, which may save the trouble and expense of bending them, and a packing of gutta-percha, india-rubber, asbestos, metallic lead, etc., is supplied to fit upon the ferrule, so that when the joint is once braced up the packing cannot readily escape.

Another advantage of the joint is that when ordinary galvanized tubes are screwed the coating of spelter is necessarily cut away, and as the socket never actually covers the whole of the threads, there is a portion of bright metal exposed which is subjected to corrosion, and this part is unfortunately thinner than the body of the tube by the depth of the thread. But galvanized tubes fitted with the Williams joint are not touched by a cutting tool and no part can corrode. Finally, in the maker's words, "the prices are much lower than those of any other tubes in the market, and compare successfully with cast-iron pipes." I may add that many miles of piping fitted with Mr. Williams' joint have been laid up to the present without the occurrence of a single leakage. —*English Cor. American Manufacturer.*

HOW TO SECURE CLEAN CASTINGS.—Clean castings are not always easy to make. A European authority gives a method used by a Dusseldorf firm to separate the light impurities from molten iron or other metals in the operation of casting, with a view to securing pure and clean castings. The "separator" is placed upon the inlet aperture of the molding-box and consists of a rectangular casing provided with a number of transverse partitions, dividing the casing into a series of separate chambers, which are in communication by means of openings at the bottom of the partitions. The molten metal is poured into the separator at one end and is caused to pass through the several compartments in the apparatus before it can enter the molding-box, the light impurities being in this way caused to rise to the surface and prevented from entering the mold with the metal. As the metal passes from compartment to compartment, more and more of the impurities are separated, until the metal reaches the inlet to the mold in a practically pure state; air is also effectually prevented from entering the mold together with the metal. In the second chamber there is arranged near the inlet a round iron rod, which produces ebullition of the metal, causing the impurities to rise to the surface. It is stated that by the use of this apparatus exceeding dense and pure castings may be produced. —*Mechanical and Milling News.*

NEW HYDRAULIC TUBE PRESS.—We had this week the privilege of inspecting a powerful hydraulic tube press for forming metal and steel tubes from circular plates by pressing or forcing them by the aid of mandrels through dies or annular rings. The press is designed and built by Messrs. Henry Bessemer & Co. of Sheffield, for the Birmingham Small Arms Factory, to be used for the manufacture of tubes of large size, and more particularly for making shrapnel, segment, and other hollow steel projectiles which the Government is now anxious to obtain. Hitherto these projectiles used by the English artillery have been made of either cast iron or steel, but the wrought material has proved so much superior that forged hollow projectiles are bound to supersede the present cast materials. The press is built entirely of Bessemer steel of sufficient strength to impart a downward pressure of about 1500 tons, with a stroke of 12 feet. It is also furnished with two cylinders with an upward pressure of 500 tons for the purpose of stripping tubes from mandrels. This novel process of producing hollow tubes and projectiles will dispense with the old method of boring them from the solid bar, which was not only very expensive, but prevented rapidity and extent of output. —*English Paper.*

AN ALLOY FOR COLD SOLDERING.—*La Metalurgie* describes a new alloy which is useful when metals are required to be soldered together at a low temperature. Finely divided copper is obtained by adding zinc to a solution of sulphate of copper. From 20 to 30 parts of this copper, according to the hardness required, are mixed in a cast-iron or porcelain mortar

with concentrated sulphuric acid, to which is added 70 parts of mercury. The amalgam thus formed is thoroughly washed with water, in order to remove the sulphuric acid, and after being left untouched for some time it becomes sufficiently hard to scratch lead. In using the alloy for soldering, it is warmed until it assumes the consistency of wax, in which state it can be applied to the joint.

THE CASTNER SODIUM-ALUMINUM PROCESSES. The manufacture of cheap aluminum has been the dream of the metallurgist for many years, and innumerable have been the "processes" proposed for its realization. Among the most successful of these are the Kleiner method and the Castner method. Each of these methods makes aluminum through the reducing effect of sodium, and as the production of this is necessarily expensive by any method of manufacture yet known, the improvement effected by these processes, though great, seems to us to be only a step in the right direction, and to be indeed a step on a road that will never lead up to, though it approaches, the desired goal—cheap aluminum. This dream, if dream it may be called, must be realized by some direct method, which will take a cheap ore and reduce the metal so as to give it to us at the cost of copper or zinc or lead.

NEW TIN PLATE MACHINERY.—One of the most recent improvements in the mechanism of tin-plate manufacture is the Clydock patent tinning machine. The unique design and ingenious construction of this new apparatus renders it an object of much attention in England. It performs all the work of coating sheets automatically. The action of the mechanical arm attached to the machine for the transference of the plates from the tinning-pot to a rack ready for the cleaning process, is a very interesting and novel feature. The operation is effected without the disadvantage of leaving marks—the not infrequent accompaniment of manual treatment. Fewer wasters are consequently caused, and economy in materials, labor and fuel is also effected.

GIGANTIC HYDRAULIC PRESSES.—In some of the large shops at Sheffield, Eng., gigantic steel forgings are dealt with in a manner that a few years ago would hardly have entered into the heart of man as possible. Hydraulic presses working up to 4000 or 5000 tons are sometimes the engines which men have called to their aid. These things naturally call to mind the question—How are the vast forgings of the future to be hauled; how are they to be carried from the place of production to that where they are to be used? It is these thoughts which have led to the idea of constructing a ship canal from Sheffield to tide-water.

FLAWS IN STEEL.—A correspondent of the *American Machinist*, in allusion to the longitudinal cracks so often met with in wrought steel, explains the trouble as follows: The steel is simply piped. It is caused by hammering the steel when it is too cold under the trip or steam hammers, but sometimes by a flaw in the ingot. It is frequently seen in small tips when they have been forged, from large steel down to small sizes, and some smiths are liable to hammer a piece of cast steel too cold. When so hammered, it will crack in the center almost every time.

EXPERIMENTS WITH SHEET COPPER.—Some very careful experiments to ascertain the effect of increased temperatures upon sheet copper were made several years ago by the Franklin Institute of Philadelphia. Strips of copper were pulled asunder in a properly designed machine at various temperatures ranging from 122° to 1332° F. It was found that there was a gradual and regular falling off in strength as the temperature was increased until the point of 1332° was reached. At this point the copper was at a red heat and the tenacity was nil.

MORE LOCOMOTIVE WORKS.—Some idea of the rapidly increasing necessity for locomotives and cars to meet the demands of our immense interior commerce may be inferred from the fact that the Pennsylvania Railroad Company has resolved to erect immediately at Altoona five immense railroad-shops at a cost of \$100,000 each. The shops will have a capacity for turning out 150 locomotives a year. That company proposes to concentrate all their engine and car-building at that central point on their road.

NEW TAY BRIDGE.—Professor Ewing of University college, Dundee, has recently made a number of seismographic observations on the new Tay bridge. The instrument, which was placed on the southernmost of the great girders, records the vibration during the whole time a train is on the bridge. As the latter comes on at the Dundee end, $\frac{1}{2}$ miles away, oscillations of 1-500 inch are observable, which increase as the train advances to a maximum of one-half inch.

SOMETHING NEW IN THE MECHANICAL TREATMENT OF LEATHER.—Mr. H. F. Bird, of Boston, Mass., has perfected a method for rendering worthless leather valuable by plumping, stiffening and waterproofing the same for use for in-soles, counters, box-toes, etc. He is able to waterproof every part of the shoe or boot either before or after it is finished. A company has been formed to carry on the business with a capital of \$100,000.

GOOD HEALTH.

Use and Abuse of the Brain.

There is a curious disease of the nervous system which is produced by continually using the fingers in the same way for many hours at a time. It is called, according to the occupation of the sufferer, "writers' cramp," "fiddlers' cramp," "engravers' cramp," "telegraphers' cramp," "type-writers' cramp," and so on. The most remarkable feature about the disorder is, that though the subject of it cannot execute the movements necessary to his profession, and which occasion the affection, he can do anything else with his fingers. Thus the book-keeper affected with "writers' cramp," though seized with a spasm of the fingers the moment he begins to write, can use the same fingers in playing the violin, setting type, or, in fact, in executing even the most complicated movement without the slightest difficulty, provided he possesses the requisite technical skill. The nerves are simply exhausted for the particular work which he has been carrying on for years. They have got in a rut, as it were, and cannot get out till rest and change of occupation have permitted them to accumulate the special kind of force needed for writing.

What is true of nerves and muscles is equally true of that organ from which the nerves and muscles receive their force. Excessive use, especially within a limited range, is certain to damage and sometimes to absolutely destroy the parts of the brain which have been unduly exercised.

A man, for instance, spends the greater part of his life in the pursuit of wealth. He leaves his office at evening, but takes his business home with him, carries it to bed with him, thinks of it till tired nature forces sleep upon him, and then it is even with him in his dreams. Frequently, however, he does not sleep, but lies awake hour after hour revolving in his mind all the schemes of the day before and devising new ones for the morrow. In such a case he is burning his candle at both ends, and the day is not far distant when he will have no candle to burn. He goes to his work in the morning ill prepared for either physical or mental exertion, for sleep, that period of life during which the brain repairs the damage that it has received during the day, has either not visited his eyes at all or has come in fitful slumbers that have done him little good. Is it a matter for astonishment that after weeks, and months, and years of such a life, mental decay in some form or other should make its appearance, and that the victim should die outright, or should pass the few remaining years of life within the walls of a lunatic asylum?

Undoubtedly the brain is strong and is capable of doing a great deal of work, and even in many cases resisting the bad treatment to which it is often subjected. It is not frequently the case that the brain suffers from good, honest intellectual work. It is the undue exercise of the emotions that break it down, and unfortunately the work of the present day can scarcely be accomplished without some one or more of the emotions being brought into inordinate action, and, according to my experience, the emotion that affects it most injuriously is anxiety.

Those men suffer less in the brain and nervous system who are able to cast aside all thoughts of business the moment the time for evening work has come. It is those who carry their business home with them, and who allow it to fill their minds when they should be seeking recreation, who suffer the most. It is those who are able to cast off all business cares when their offices are closed, and who spend their evenings in work of a different character from that in which they have been engaged through the day, or, better still, who pass several hours in rational amusements, who are most likely to escape headaches, insomnia and insanity, and to die after a long life in full possession of their mental faculties.

This is only one means for getting overworked brains out of the rut in which they have toiled. Horseback-riding, driving, gymnastic exercises, are always of great use, and we should hear much less of softening of the brain, broken-down nervous systems and insanity if these organs were more frequently brought into use. The brain-worker who divides the day into three portions, taking eight hours for sleep, eight hours for business and eight hours for satisfying his meals and recreation, will be pretty certain to keep his mental faculties in full vigor till he has passed far beyond the age of threescore years and ten.

CELERY FOR RHEUMATISM.—The Leeds (England) *Mercury* is responsible for the following: New discoveries—or what claim to be discoveries—of the healing virtues of plants are continually being made. One of the latest is that celery is a cure for rheumatism; indeed, it is asserted that the disease is impossible if the vegetable be cooked and freely eaten. The fact that it is always put on the table raw prevents its therapeutic powers from being known. The celery should be cut into bite, boiled in water until soft and the water drunk by the patient. Put new milk, with a little flour and nutmeg, into a saucepan with the boiled celery, serve it warm with pieces of toast, eat it with potatoes, and the painful ailment will soon yield. Such is the declaration of a physician who has again and again tried the experiment and with uniform success. He adds that cold

or damp never produces but simply develops the disease, of which acid blood is the primary and sustaining cause, and that while the blood is alkaline there can be neither rheumatism nor gout. Statistics show that in one year (1876) 2640 persons died of rheumatism in this country, and every case, it is claimed, might have been cured or prevented by the adoption of the remedy mentioned. At least two-thirds of the cases named heart disease are ascribed to rheumatism and its agonizing ally, gout. Smallpox, so much dreaded, is not half so destructive as rheumatism, which, it is maintained by many physicians, can be prevented by obeying nature's laws in diet. But, if you have incurred it, boiled celery is pronounced unhesitatingly to be a specific. The proper way to eat celery is to have it cooked as a vegetable after the manner above described. The writer makes constant use of it in this way. Try it once, and you would sooner do without any vegetables, with the single exception of the potato, rather than celery. Cooked celery is a delicious dish for the table, and the most conducive to health of any vegetable that can be mentioned.

MEDICINAL VALUE OF BUTTERMILK.—Through the simplest remedies relief often comes, and one of the new methods of medicating a patient by food may be found in carrying out this formula, as was successfully practiced in General Sheridan's case. Lactic acid, which is not far off from the leverage commonly called buttermilk, has been doing peptic wonders, it is announced. A good many people who are "out of sorts" with liver trouble might try the buttermilk cure direct without waiting for an illness to have it prescribed for them. Especially old people and worn-out people frequently find a fountain of youth in the churn's surplus. —*Philadelphia Ledger*.

USEFUL INFORMATION.

The Manufacture of Mortar.

Very much in regard to the durability of a building depends on having the mortar made on correct scientific principles. Both the durability and safety of buildings depend largely upon the character of the mortar which is put into them. Brick buildings and those not very old are often seen, from which the dry and hardened mortar could easily be picked by the fingers from between the bricks. There is one advantage to be derived from the use of such mortar; if the building tumbles down, or if it is pulled down, there is but little trouble or expense in picking the mortar from the bricks preparatory to putting it up again.

Mortar is often prepared by persons not properly skilled in such work. In order to secure mortar always good and uniform, an idea has been developed in Germany in the shape of the manufacture of mortar by machinery in large quantities to be delivered to contractors or individuals as required for use. About 2,000,000 barrels were disposed of on this plan last year. The idea is a good one and might well be put in practice in all large cities. A brick wall, if put up with the right kind of mortar, will be solid and almost homogeneous, as likely to break through the middle of the bricks as at the joints. Such a building will never tumble down except under great strain, and will even withstand a pretty severe earthquake shock.

An old builder of nearly 40 years' experience in making mortar, writing upon the subject to a contemporary, very justly says: "The mere matter of lacking lime does not make mortar out of it. Lime and water alone will not make any better mortar than sand and water." He suggests the use of plenty of water in lacking the lime, so that when it is run out of the box into the bed it will not bake or burn, as it is liable to do if not well watered. The mortar-bed should be made large and tight, so that there will be no leakage of the lime-water. The proportions should be about 50 yards of good sand to 25 barrels of lime for the first mixing, which should be thoroughly done. The hair should be put into the lime before mixing in the sand. After the mortar has been worked in the above proportions for ten days or more, if the amount of materials given has been used, 25 to 50 loads of sand may be added and worked in. It is said that the water that rises on a bushel of lacked lime, and where plenty of water has been used, if removed and put on a sharp sand, will make better stone than lime and sand mixed, showing that the water should be retained in the lime and sand while it is fresh, and that the mortar should be tempered in its own liquor. Of course where smaller quantities are used the proportion should be retained both at the first mixing and in the sand added subsequently.

USEFUL COLORS.—A variety of useful colors and dyes, says the *Oil Trade Reporter*, may be obtained from common plants growing in abundance everywhere. The huckleberry or blueberry, boiled with a little alum and a solution of copperas, will develop an excellent blue color; treated in the same manner with solution of nutgalls, they produce a clear dark-brown tint; while with alum, verdigris, and eal ammoniac various shades of purple and red can be obtained. The fruit of the elder will also produce a blue color when treated with alum. The privet, boiled in a solution of salt, furnishes a serviceable color, and the over-ripe berries yield

a red. The seeds of the common harning bush, when treated with sal ammoniac, produce a beautiful purple red. The bark of the currant bush treated with a solution of alum produces a brown. Yellow is obtained from the bark of the apple tree, the box, the ash, the buckthorn, poplar, elm, etc., when boiled in water and treated with alum. A lively green is furnished by the broom-corn.

THE OIL ROCKET AS A DEFENSE AGAINST SHIPWRECK.—Results of the scientific test of an oil rocket designed to calm the raging of a troubled sea appear to have been satisfactory enough to warrant the hope that shipwrecks will be rare occurrences ere many years. Four rockets, the same in appearance as those commonly used in ordinary pyrotechnical displays, but with the exploding-cap removed and a light tin cylinder holding one pound of train oil substituted, were sent up at varying angles of projection, the result being that the sea was calmed for thousands of feet around about the spot above which they exploded and fell. The oil spread into a thin, silk-like sheet, which, extending rapidly, appeared to have the power of keeping the waves within passable limits. Through the center of the oil runs a small tube containing two ounces of gunpowder, which ignites as soon as the motive-power of the rocket is spent, and, exploding, scatters the oil in a fine spray over the water. The action of the oil upon the water is almost instantaneous. *Philadelphia Times*.

CULTIVATE THE USE OF THE LEFT HAND. Many are the advantages missed by the non-cultivation of the left hand. Occasionally an artisan is seen who is equally able to handle tools with either hand. Such a one has constant advantages over his fellows, not only in the avoidance of fatigue, but in doing nice work and overcoming with ease difficulties that present themselves to those skilled with only one hand. The man who can use a hammer or knife, or perform any other feat with the left hand at the same time that the right hand is busy, will find frequent occasion to exercise his skill. Another and important reason for training the left hand to act with as great ease and precision as possible is, that if injury occurs to the right hand, the left can exercise readily all the functions possible to one hand unaided. By training the left hand in youth one would be spared, in such a case, from spending much valuable time in educating muscles hardened by age and unaccustomed to obey the mandates of the will.

FISH LIVING IN HOT WATER.—There is a pond on the hay ranch at Golconda which is fed by the water from the hot springs. This pond has an area of two or three acres, and the temperature of the water is about 85°, and in some places where the hot water bubbles up from the bottom the temperature is almost up to a boiling point. Recently a discovery has been made that this warm lake is literally alive with carp, some of which are more than a foot long. All efforts to catch them with a hook and line have failed, as they will not touch the most tempting bait. A few of them have been shot, and, contrary to the general supposition, the fish was hard and palatable. How the fish got into the lake is a mystery unsolved. Within 100 feet of it are springs which are boiling hot, and the ranchers in the vicinity use the water to scald hogs in the hutching season.

ECONOMY IN THE USE OF SUGAR.—All house keepers should know that crystallized sugar when pulverized, loses much of its saccharine quality. Granulated sugar, which is sugar crystallized directly from the vacuum pan, will go much further in "sweetening" anything with which it may be mixed than powdered sugar, which consists of crystallized sugar pulverized. Again, sugar boiled with an acid, if it be but three minutes, will be converted into glucose, which is the form of sugar found in sweet apples and grapes. One pound of sugar has as much sweetening power as 2½ pounds of glucose. In other words, one pound of sugar stirred into the fruit, after it is cooked and while yet warm, will make the fruit as sweet as 2½ pounds added while the fruit is boiling.

THE CALIFORNIA LION. says a correspondent of *Forest and Stream*, who has had considerable experience with the varmints, is naturally a great coward. He says: "I have known one to get into a sheep corral in the night and kill from 20 to 30 sheep, and before an hour's sun the next morning to be treed by a little 'yaller dog' and killed with less trouble and time than it would take to kill a red squirrel." He says he has known them to climb a perfectly straight tree only 18 inches in diameter and 20 feet to the first branch to get away from a common hunting dog. They will, sometimes, when pushed by dogs in a dense wood, jump from one tree to another to baffle their pursuers.

SAWDUST FOR FUEL.—Sawdust is now used for fuel at the Bath, Me., electric-light station, supplied from M. G. Shaw & Son's sawmill through an iron pipe one foot in diameter, which runs from the saw-pit to the station. A powerful artificial draught is established through this conductor, and the dust is blown from one building to the other. This new departure enables the station to secure an abundance of cheap fuel landed directly before the furnaces, and gives the sawmill a chance to get some profit out of material which was comparatively worthless.

ENGINEERING NOTES.

THE OSCILLATIONS OF HIGH CHIMNEYS.—In the *Memoires de la Societe des Ingenieurs Civils* particulars are given of the oscillations of a chimney stack near Marseilles, 35m. (115 feet) high, with an exterior diameter at the top of 1.22 m. (4 feet). During a severe storm it was determined, by observing the shadow of the chimney, that its greatest oscillation was half a meter (nearly one foot eight inches). It was further observed that a chimney set in motion by a gust of wind oscillates from four to five times backward and forward until it is at rest again. M. E. Burgh asserts that should this momentum during the oscillations of a chimney repeat itself in such a manner that its direction coincides with that of the oscillation, the overthrow of the chimney may be expected. This is the explanation given for the destruction of many a chimney constructed in accordance with sound principles of stability. Another German technical journal adds to this statement the qualification that in the case of a chimney near Vienna, 50 m. (164 feet) high and constructed of concentric (hollow) rings, with an inner diameter at the top of 2 m. (6½ feet), which is exposed to considerable gusts of wind, the oscillations were most carefully and repeatedly measured with a theodolite, when the observations showed an extreme oscillation of only 16 cm. (6½ inches) during severe storms.

TESTING FOR FOUNDATIONS.—The foundation of the Congressional Library building, now being erected at Washington, will be required to stand a pressure of 2½ tons per square foot. It was deemed of the utmost importance to test every foot of ground supporting the foundation walls. For this purpose a traveling testing machine was constructed. The method of testing the soil and putting in these concrete foundations may be briefly described as follows: First, the trench excavations are made by the contractor to the width and depth required by the plans, the bottom of the trenches being made perfectly level. Then the testing machine, consisting of a car bearing the required amount of weight in pig lead for making the tests, is placed in the trenches upon iron rails which rest upon four cast-iron pedestals, the latter being set four feet apart each way, each pedestal covering one foot of ground. Thus, one-fourth of the entire weight borne by the car rests upon each one of the pedestals, and the precise weight sustained by each square foot of ground is exactly determined. The soil being thus tested as to its resisting strength is then ready to receive the concrete foundations.

DIRECT CONNECTION.—Russia has commenced the important work of connecting the peninsula of the Crimea with Russia by a railroad and canal. The canal will be about 75 miles in length, 65 feet broad and 12 feet deep. The \$35,000,000, which will be its cost, has been secured. This, like all the great works of improvement undertaken by the Russian Government, will also have an important military value. The voyage from Odessa to Mariopol is at present 434 sea miles long; through the canal it will be only 295. Once the canal is finished, it will be easy for Russia to send her ships from the Sea of Azov to Ochakow, to the mouth of the Dnieper and to Odessa, because they will no longer have to sail round the Crimea, and will not risk being captured by foreign ships in case of war. The chief commercial reason for building the canal is the necessity for getting coal from the Don districts for the Russian fleet.

A NEW PRINCIPLE IN PROPULSION.—The Italians have made use of a new principle for the propulsion of some of their fast gunboats and torpedo boats under construction. They have improved on the twin screws of modern steamships by the addition of a third screw moved by a separate shaft and set of engines. The three screws are placed in the angles of a triangular pyramid. There is one on each side of the rudder as usual, and the third is underneath, on a level with the keel-plate. It was claimed that the third screw increased the speed by fully a third, on account of the great gain in power from the deep immersion.

A CANAL ACROSS ITALY.—An Italian engineer, Signor Victor Brocca, has just completed the survey of the proposed canal across Italy, the object of which is to save the very long journey round Cape Leca. This canal would begin on the western side near Castro, on the Tyrrhenian sea, and reach the eastern coast at Fano, on the Adriatic. Its length would be about 189 miles, and its proposed breadth 110 yards, and its depth 40 feet. For the purposes of the canal it would be necessary to drain the two lakes, Bolsena and Trasimene. The assumed cost of this gigantic undertaking is set down at 20 million sterling.

WATER FOR PARIS.—A Swiss engineer has proposed a scheme for supplying Paris with water from Lake Neuchâtel, at an estimated cost of \$100,000,000. The aqueduct required would be 312 miles long, 22 miles of which would be a tunnel through the Jura mountains. As the lake is 1620 feet above the average level of the streets of Paris, the scheme includes a plan for using the surplus head to furnish power.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

NEW LONDON.—Amador Ledger, Sept. 8: Sinking operations at this promising mine were completed this week. The shaft is down over 1200 feet, and drifting has been commenced at this depth.

MISCELLANEOUS.—The Gillick mine has been started up once more. Hoisting machinery is being erected on the property, and everything indicates that thorough prospecting will be done. There is no mining worth speaking of being done at Volcano at present. The Volcano Gold Gravel Co. is operating on a small scale. The Grass Valley gravel claim is idle for lack of water. The water failed upon them so suddenly this season that they were unable to complete cleaning up. Negotiations are now in progress for the sale of the Amador Queen property to the Minear Co. The price is said to be \$125,000.

PLYMOUTH CONSOLIDATED.—It is now definitely stated that this property will be opened between now and the 15th instant.

Mariposa.

BEAR VALLEY.—Mariposa News, Sept. 8: The shaft at the Winner, the recent find, is now down over 70 feet. The indications still continue good. The shaft will be continued to several hundred feet if the prospects justify it. The Red Cloud shaft is down 575 feet. Two six-inch pumps are used in pumping. The rock in the bottom looks well. The Bonduand mine has commenced work again with a small force. They are putting up an upraise from the main shaft to the surface preparatory to erecting hoisting works.

NOTES.—The new quartz mine recently discovered at Bear Valley still shows good indications. The shaft is down over 70 feet. The vein is from three to five feet, and in good milling ore. The Vanderbilt mine is shut down at present on account of scarcity of water. Two shafts are now at work on the Groves & Ellingham shaft at Whitlocks.

Nevada.

THE EL DORADO.—Nevada City Herald, Aug. 27: The principal owners of the stock in the El Dorado mine are residents of this city. The El Dorado is situated in the famous Delhi section, near Columbia hill, but this town feels a lively interest in its development, for it is confidently expected it will prove a good mine. The owners have patiently stuck to the work of development under very discouraging circumstances, but now feel they are near the ledge with the long, hard-rock tunnel they have been driving for the past eight months. The rock in the face is softer and full of clay seams, which change indicates a near approach to the ledge. G. J. Brand promises to serenade the camp with a brass band if the ledge at the point struck is as favorable as all the indications promise it will be.

NORTH BANNER MINE.—Grass Valley Union, Sept. 8: Good progress is being made on the new mill of the North Banner Company. It will be a 10-stamp mill, and located below the mouth of the tunnel, so that the ore can be run directly from the tunnel to the dump in front of the batteries. Five stamps of the old mill will be utilized in the new mill, but little else of the structure will be used. The mill, which will have the latest improvements, will be driven by water-power under pressure by a Pelton wheel. Pelton wheels will also be used for raising the ore and pumping in the mine. There will be five of these wheels in all used about the works.

BRUNSWICK MILL.—Grass Valley Union, Sept. 7: The mill of the Brunswick Mining Co., which has been working for several days in preparation, was started up with the full head of ten stamps. There is on the dump between 200 and 300 tons of quartz, and the ground that is opened in the mine will enable the working force to keep the mill going regularly. The quartz that is on the dump is of fair milling quality, and favorable cleanups are anticipated.

Placer.

GRAY EAGLE.—Placer Argus, Sept. 1: Things are progressing in good shape at the Gray Eagle mine at Spring Garden. The shaft is down 340 feet, making it the deepest on the divide sunk from the surface. The shaft is nine feet in the clear, in two compartments—one of five feet for hoisting and the other four feet for pumps and ladder. The machinery consists of three boilers of 60-horse power, a single drum-friction hoisting engine, with 600 feet of wire cable, an 18-inch blower and six pumps. At a depth of 230 feet there is a T drift 16 feet back, then 30 feet long at right angles. This is dug down about six feet and is used as a reservoir. There are about 14 inches of water in the mine, most of which is caught at the level. Three pumps are stationed here—two in action and one in reserve, and another is placed at the bottom.

Plumas.

THE GLAZIER MINE.—Greenville Bulletin, Sept. 5: Dick White is in town from the Glazier mine, on North Fork, and reports very rich gravel. The lower tunnel is in nearly 500 feet. At the end of this tunnel an upraise of 17 feet was made, striking into gravel that is very rich in coarse and fine gold. Although the gravel is cemented and very hard, it pays from \$10 to \$20 to the man. Some of the pieces are very large, one of them containing \$26. The channel is from 100 to 200 feet wide. It is a part of an ancient river-bed, evidently cut into by the present North Fork of the Feather river. At the lower end of Big Flat is Meeker Flat, where a man named Meeker and Jobe T. Taylor took out large quantities of gold in 1852 or 1853. This is dug down below this break, Nick Meadows, in a small claim, has taken out, it is estimated, between \$10,000 and \$14,000. Above the Glazier and on the opposite side of the present river, two claims are located on the channel, while five claims cover that part of Big Flat not occupied by the Glazier, whose length is 1½ miles. Here is a chance for one of the richest and largest mining operations in the State.

Sierra.

THE KEYSTONE.—Tribune, Sept. 7: Four men are employed at the Keystone mine by its owner, M. H. Mead. These hands are engaged in putting

through an upraise to the surface and taking out ore for the winter run. It is very probable that inside of another year this mine will be worked on an extensive scale. The Bunker Hill mine, situated near the head of Poorman's creek, is employing 30 men and taking out gravel that pays from \$3.75 to \$4.50 a carload. It is predicted that an immense amount of money will be taken out of the mine during the next year. At the Gold Lake mine, owned by Messrs. Willoughby, Jones and others, the tunnel has been run about 150 feet on the ledge, and the rock prospects well the entire distance.

MEADOW LAKE.—Fred Morris, the newly-installed superintendent of the Marguerite mine at this place, and A. W. Gove came down from Meadow lake last Saturday with a 55-ounce bar of gold (value \$1028.50), the result of the last 11 days' run with ten stamps at the Excelsior mine. This is the last run that will be made there this season with the exception of 20 tons of ore which Jim Hill and Watt Hughes propose to have crushed from their claim. It is found necessary to hang up the mill, owing to the fact that enough dry wood cannot now be obtained to carry them through the winter.

Shasta.

FOSTER MILL.—Shasta Courier, Sept. 8: The burning of the Foster mill at Bullyhoop is quite a setback to that long-delayed district, so rich in mineral wealth and so poor in ready capital.

IRON MOUNTAIN.—Iron Mountain Main Works have shut down, hands paid off and discharged. We understand that this cessation is but temporary in order to repair and replace machinery impaired by use for months past. A mine from which \$10,000 bullion per week is taken is not a failure.

Siskiyou.

FROM THE MINES.—Yreka Journal, Sept. 12: All the river claims on Klamath river in the Honolulu district, north of this place, are paying well this season, and the companies are taking out considerable dust to pay up their debts and get something over. The Phil Mott Company cleaned up 360 ounces from their last cut and are now sinking down on another cut which will pay still better, as the channel was very rich where they quit work in last cut. The Centennial Company made a good clean-up from their last cut and are now sinking down a new cut with still better prospects. The several other companies along the Klamath are all taking out considerable gold and expect to be able to realize a greater amount this season than for many years past, if not driven out by high water and heavy storms before December. The claims above Honolulu, all the way to Henley, are also paying better this season than usual. The Schroeder & Werner quartz ledges, at head of Deadwood creek, are reported as paying handsomely, and a large force is kept constantly employed in getting out quartz and running the mill. The Mountain Boomer quartz mine at New River, in Trinity county, prospects exceedingly rich at present. A tunnel has been run in the mountain from the end of which two drifts have been extended 200 feet each way, also four raises 100 feet apart and 150 feet high, all exposing very rich quartz. About 150 feet below this tunnel another tunnel 150 feet long has been run in to tap the ledge, where the quartz is equally as rich as in the upper level. At Know Nothing creek, in this county, on this side of the New River divide, all the quartz ledges are looking splendid and promise big pay when thoroughly opened. Mr. Clark has a good ledge which contains rich quartz promising a big yield as soon as the winter rains afford water for running the mills. The Know Nothing Company, now building a mill, expects to take out big pay during the coming winter. All the companies at Know Nothing creek, New River, and the tributaries of the Salmon and Trinity rivers along the boundary of this and Trinity county, have their dumps full of quartz, besides considerable piled up outside, awaiting the winter rains to furnish water for the batteries and motive-power for running the mills.

Trinity.

NEW STRIKE.—Trinity Journal, Sept. 8: A good strike was made last week in the prospecting tunnel which is being run on the Lone Jack mine, East Fork district. The tunnel was commenced two years ago but was not pushed till recently. Men driving ahead struck a 2½-foot ledge of good working ore, which shows every indication of a permanent vein. Heretofore the ledge has been broken. The Lone Jack is the pioneer ledge of the district, and was discovered in '83. One crushing of ore from it by inexperienced hands averaged \$36 to the ton. The ledge is owned by the Enterprise Company, and the new strike will greatly enhance the value of their property.

Tuolumne.

MINING NOTES.—Union-Democrat, Sept. 1: Messrs. Oliver & Harriman went to the Bay Monday to get hoisting and pumping machinery for the Bonanza mine. Over 1000 feet of sheet-iron pipe has been received at Summerville for the Eureka Consolidated. It will average 12 inches in diameter. The Utica mine and mill at Angels, Chas. Lane superintendent, is doing splendidly; 40 stamps will shortly be added to the mill, making 60 in all. The crushing capacity will then be nearly 150 tons per day. Mr. Ferguson's quartz-mill at the water-works in Sonora was running this week on rock from the mine of Mr. Marshall, in the southern part of town. The Green mine, several miles northeast of the Excelsior hotel, has resumed operations. Properly opened and developed this mine would soon become a big success. Harry Kirk of Dr. Walker's mine, the Pine Nut, was in town Wednesday. He and James Fitzgerald are running a tunnel on the mine, and it is now in about 100 feet. Mr. Kirk reports the mine as looking well and presenting every indication of a permanent and valuable property. Chas. Smith and partner, Mr. Wilson of Brown's Flat, are getting a big prospect in their claim (the Brown mine) a short distance above the Flat. They are following down the main chute which has a fine crossing, attended by beautiful blue slate. The shaft is now a considerable depth below Wood's creek, but the hoisting and pumping machinery situated in the tunnel easily keep the water at bay. We are informed from reliable sources that the crushing of 65 tons of quartz from the Laura mine has been completed, and furthermore that it yielded over \$3000. The percentage of sulphurets will average 10 per cent—200 pounds to the ton. Lotus Page, the veteran prospector and mining man, was in Sonora Monday. He reports that his shaft at Saw Mill Flat requires con-

stant and intricate timbering to keep it from caving. The breaking of the ditch some time ago allowed the mine to fill with water, which so loosened the hanging wall as to necessitate extra expense and time in timbering. The Moffitt mine at Moffitt's Bridge is working a force of 30 men, and when the water is pumped out it will be increased to 50. The flume now carrying the river-water is about 900 feet in length and is thought to be the longest one in this county. Mr. Moffitt proposes as soon as he can get into the bed of the river to work entirely new group.

NOTES.—Union-Democrat, Sept. 8: Mr. Popovich and partners are striking it rich in their mine on Bald mountain. Mr. Crookshank is doing well with his mine on the Tuolumne river, several miles below Groveland. Mr. Fischer of Tuttle town has completed the construction of his mill at the Lennan mine, situated a short distance below, south and west of the Morris mill. Louis Blanding has tried his new treatment for copper plates at the Ferguson mill in Sonora. It keeps the plates as bright as if they were made of silver. No oxidation can take place and the process works to a charm. It is simple, astonishingly cheap and wonderfully effective. Johnny Hatvig has made arrangements to crush about 20 tons of ore at the Ferguson mill in Sonora. His mine is distant four miles from Sonora, but he feels that the quartz will pay for the trouble and expense. We are pleased to state that the Lane mine, almost within the city limits of Sonora, is looking exceedingly well. A sample of the ore coming from the Norwegian mine was yesterday shown us by Mr. Louis Blanding. It contains free gold in quantity, and is especially interesting from the fact it carries rich tellurides of gold, and silver as well, such as are found in the famous Bonanza mine, situated in the city of Sonora. The Norwegian mine is situated near Robinson's Ferry on the Stanislaus river, and has a 2-foot vein. It is being energetically worked by Messrs. Fischer and Rowe. We learn that Chauncey Wetmore has made arrangements to have a number of tons of quartz worked at the furnace and arrastra of Fred Sutton on Wood's creek. The character of quartz is precisely similar to that of the San Guiseppi mine, and the gold is largely sulphureted. Chauncey Wetmore has been developing the lead for some time, and now the shaft is down about 45 feet. The lode runs east and west, is on Negro gulch, and but a short distance from the Golden Gate mine.

NEVADA.

Washos District.

BELCHER.—Virginia Enterprise, Sept. 8: The 500 level east crosscut shows no change. Will stop this crosscut in a few days and start a drift from the Belcher shaft to connect with the Crown Point 200 level as soon as the surveys are completed. This will give an important connection in case of accident. At the same time it will prospect ground that has never been touched before. The shaft repairs are finished and are now engaged on the incline shaft. The Sutor tunnel drift is out 660 feet, having about 240 feet further to go to connect with the Crown Point 1300 level drift. There is about six weeks more work to connect.

CON. CAL. & VIRGINIA.—On the 1300 level continue retimbering the main south lateral drift. On the 1465 level, at a point in south lateral drift No. 2, 70 feet south from west crosscut No. 1, an east crosscut is advanced 25 feet. The formation is porphyry, with quartz carrying some value. Continue to extract usual quantity of good ore from the stopes east of the winze below this level. On the 1500 level are continuing to extract ore from the southeast drift run from the upraise above the parallel north drift, 58 feet above the track floor of this level. Work is resumed in the parallel north drift on this level, and it is extended a total length of 130 feet from the end of east crosscut No. 1. On the 1600 level continue to extract ore from the stopes around upraises Nos. 1, 3 and 4. Are also extracting some ore from the drift running south from the Ophir line, 36 feet above the track floor of this level. On the 1650 level, the upraise above the drift running south from the east drift from the Con. Va. shaft is up 45 feet. Ore is being stoped from the end of the south drift.

HALE & NORCROSS.—On account of scarcity of water the Nevada mill had to discontinue milling ore for us the first of this month. It worked for us during the month of August 2615 tons. The average of the battery assays was \$12.38 per ton. Have bullion on hand and previously shipped amounting to \$80,000. Complete returns have not yet been received from the Mint. The west drift on the 500 level has been advanced 50 feet, making its total distance 375 feet. Have started to open a new working station on the 800 level, from the vertical shaft.

GOULD & CURRY.—El Dorado level: East crosscut No. 1 from the end of main south drift has been advanced 35 feet in good milling ore. North drift started from west crosscut No. 2, through the old stopes, has been advanced 20 feet. The upraise 45 feet south of crosscut No. 2 has been carried up 28 feet; total height 101 feet. The top in low-grade ore. Drain tunnel: The main south level drift started from east crosscut No. 2, has been advanced 12 feet. Formation in quartz giving low assays.

CHOLLAR AND POTOSI.—The face of north drift No. 2 on the 650 level of Chollar is in clay and quartz of low grade. The old Potosi shaft between the 450 and 550 levels has been cleaned out and retimbered, giving good ventilation to those levels. They have commenced cutting out a new station in the Chollar shaft at the 750 level. In the Potosi mine there is no change in the character of the ground on the 650 level. Considerable work is being done repairing drifts, easing timbers, etc.

ANDES.—During the past week the north drift from the west drift on the 350 level advanced 80 feet in very good looking quartz, some of which assays very well. The east crosscut on the 240 level advanced 7 feet through very hard rock that requires constant blasting, being a mixture of clay and porphyry.

CROWN POINT.—The 700 level south drift from the crosscut advanced 22 feet during the week, making a total length of 78 feet. There is no change to report in the ground. A crosscut has just been started on the 700 level running west, which is expected to reach the ledge within 30 feet.

SAVAGE.—Have finished retimbering 149 feet of the vertical shaft and are now putting in guides.

The south drift on the 500 level has been advanced 38 feet and continues in fair-grade ore. Are running prospect drifts and easing timbers on the several levels of the mine.

BEST & BELCHER.—El Dorado level: West crosscut No. 1, from main northwest drift, has been extended 34 feet; total length, 116 feet. Formation clay and quartz. The main northwest drift has been advanced from west crosscut No. 1, 12 feet. The face is porphyry.

ALTA.—Are extracting the usual quantity of ore from the 825 level, which is being concentrated at the mill. Sinking on the Keystone vein to meet the upraise is progressing favorably; also work of cross-cutting from Alta shaft.

ALPHA AND EXCHEQUER.—On the 382 level of Alpha the northeast crosscut is in 60 feet. On the 500 level the station is in and timbered 28 feet. The east drift is in 25 feet in hard porphyry and quartz.

WEST YELLOW JACKET.—Have been at work temporarily and started to drift at another point. Clay wall carrying quartz in this drift. Will crosscut from this drift after it is advanced properly.

OCCIDENTAL.—On the 48 and 100 levels are stopping ore from these points. Have extracted and shipped to the Atlanta mill 137½ tons. Assay of wagon samples, \$30 per ton.

UTAH CON.—472 level: The east crosscut has been extended 63 feet; total length, 95 feet. The formation is vein porphyry, showing streaks of quartz and some clay.

SEG. BELCHER.—Have advanced the south raise 24 feet since last report, making its total height 74 feet above the track floor. The ground is softer and breaking better.

YELLOW JACKET.—A large force of men is at work repairing and putting a new foundation under the machinery of the hoisting works. The work is progressing fast.

CONFIDENCE AND CHALLENGE.—Only work of repairing and retimbering is being done. The men reach the mine through the Crown Point shaft.

MEXICAN.—On the 1465 level a joint Union drift started from the east drift of the Ophir shaft at a point 150 feet in, is advanced 188 feet.

SIERRA NEVADA.—On the 520 level east crosscut No. 3 is advanced 340 feet. It is still in porphyry with clay slips showing some water.

OPHIR.—On the 1465 level the old east drift from the shaft station is retimbered 165 feet. The shaft station is being repaired.

JUSTICE.—Are prospecting and hoisting ore from the 600 level. Work on the mill and hauling of material is progressing favorably.

BULLION.—Drifting south on the 640 level and crosscutting east on the 500 level, with no particular change to report.

SCORPION.—The south drift on the 500 level has been extended about 15 feet during the week.

BALTIMORE.—Are prospecting in the ledge on the 338. Upraise No. 2 continues to look well.

UNION CON.—Report is identical with that of Mexican.

IOWA.—There is nothing new to report this week.

Tuscarora District.

COMMONWEALTH.—Times-Review, Sept. 7: One hundred-foot level: No. 2 south drift has been extended 29 feet. It has reached the Queen line and a crosscut started to intersect with the upraise from the 150-foot level. The work of timbering the intermediate drift is progressing well. Some very high-grade ore is being extracted in cutting out for timbers. One hundred and fifty-foot level: No. 1 north drift from No. 1 west crosscut has been advanced 15 feet. No. 3 north drift from No. 1 east crosscut has been advanced 11 feet; the face is all in vein matter giving low assays. The east lateral drift has been advanced 8 feet. Have resumed sinking the No. 2 winze from east lateral. The bottom is showing very fine ore. A crosscut has been started near the south end line to connect main south drift with the east lateral. No. 2 west crosscut from main south drift has been advanced 26 feet. Two hundred and twenty-five-foot level: Main south drift has been extended 38 feet, cutting seams of ore assaying \$44 per ton.

NEVADA QUEEN.—The 450-foot level north drift has been extended 10 feet. Joint upraise at the line has been extended up 20 feet; total, 40 feet. The top is still showing very high-grade ore. The stopes are yielding a full supply of ore for the mill. Average assay from battery pulp \$203 per ton. Average assay from car samples \$28.20 per ton. The 100-foot level south drift of Commonwealth has reached the line and a crosscut started to connect with the joint upraise from 150-foot level. The 150-foot level south drift from Commonwealth has been extended 7 feet. The mill is running full capacity and doing good work. Shipped on the 5th inst, \$20,800.

NAYAJO.—The crosscut from south drift on the west vein, 350-foot level, extended 6 feet. North drift from No. 2 winze on east vein, 250-foot level, has been connected with No. 1 winze. The stopes on the 350-foot level are looking well and turning out some very high-grade ore.

FOUND TREASURE.—Southeast drift on south-west vein, 150-foot level, has been extended 10 feet. Stope from No. 3 upraise continues to yield high-grade ore. Southeast drift, 200-foot level, has been extended 20 feet. The face of the drift is showing some high-grade ore.

BELLE ISLE.—The east crosscut from the north drift, 250-foot level, extended 14 feet. The face looks favorable. Some high-grade ore has been taken from the stopes on this level.

DEL MONTE.—The combination shaft has been sunk and timbered 12 feet; total depth, 20 feet. The rock breaks well but is a little harder.

GRAND PRIZE.—All work in the mine has been suspended to admit of repairing the shaft, on which good progress is being made.

NORTH COMMONWEALTH.—The combination shaft has been sunk 12 feet cutting a small vein of chloide ore.

NORTH BELLE ISLE.—East crosscut No. 2 north, 300-foot level, extended 6 feet. The joint upraise from the 400-foot level is up 40 feet and still shows a good width of very high-grade ore. The usual amount of high-grade ore has been taken from the stopes. The machinery in the concentrating works

is being rapidly placed in position. Good progress is being made with the grade for the Union mill.

ARIZONA.

HASSAYAMPA DISTRICT.—This district being of large size, centrally located, easy of access and the most productive in early days of placer gold, naturally has been more carefully prospected for mineral than almost any other in the Territory. Its principal stream, Hassayampa creek, heads in springs on the western side of Mt. Union and the south side of divide between it and Lynx creek and flows west for 12 or 14 miles, and then nearly south for 100 miles, emptying into the Gila river some 30 miles west of the City of Phoenix. All of the country drained by its headwaters is embraced in the Hassayampa mining district, except the Groom Creek district spoken of in the last letter. The district is nearly 20 miles square. From the eastern and southern side the creek is fed by Maple, Boggs' gulch, Jennings' gulch, Slate creek, Ash creek and the East Fork. From the north and west by Little Creek, Groom creek, Indian creek, Big and Little Copper creeks and Catochin gulch. The district is well watered for Arizona. Most of the streams mentioned are running ones the larger portion of the year, and all the mines opened to any depth worth speaking of. The predominating rock is granite and slate, with large belts of porphyry and quartzite at intervals. The main mineral veins run northeast and southwest, but there are cross veins running in every direction. The main creek and most of its tributaries have been mined extensively for placer gold, and all the mineral veins in the district, whether called silver, copper or lead mines, carry an appreciable quantity of gold in their ores. From Mt. Union the Sierra Prieta range of mountains swing round in a half circle, open to the north, in which concavity is the basin of Granite creek and the City of Prescott. All along the west and north line of the range the mountains break off very suddenly down to the valleys called Skull, Kirkland and Walnut Grove. South from Mt. Union a high range, known as the Turkey mountains, extends 20 miles to the Bradshaw mountains, forming the division line between Hassayampa and Turkey Creek mining districts. The range seems also to be a dividing backbone between two mineral belts, being itself comparatively barren—Big Bug, Turkey Creek and Black Canyon districts being on the east side of the range, Hassayampa and Walnut Grove on the west. A miner in Phoenix claims to have discovered the old Spanish silver mine worked 300 years ago. He locates it near the Grand canyon.

COLORADO.

AMONG THE MINES.—Silverton *Miner*, Sept. 1: The Buckeye is advertising for bids for several hundred feet of drifting. The Maid of the Mist machinery has arrived. The Stadacona on Sultan is being worked by a small force. The Climax is sinking the shaft and the company is shipping heavy galena from the Lost Boy. Hunt & Bell have struck a solid streak of gray copper in the Nevada at Guld. Henry Schlicker has struck some pretty good ore in the Theresa No. 1. The Mountain Queen begins regular shipments the coming week. The ore strike has changed to solid gray copper, averaging 110 ozs. The Bismark lode, a short distance from the Simpson mill above Gladstone, is showing up some fine bluish and gray copper. The tunnel is in 75 feet. The Saxon mine in Poughkeepsie gulch has been sold to a St. Louis syndicate, by John J. Myers of Ouray. The deed was placed on record this week and marks the consideration at \$50,000. The Wheeler Bros. own the Harrison lode above Gladstone. They are just about to complete a 150-foot crosscut, which will cut the vein 85 feet deep. A. H. Bridgman and W. W. Reese, who have a sub-lease on the Bear, struck 110 ounces this week in the drift. Capt. Handy brought over from Swamp canyon one of the finest gold specimens ever seen in the country. The rock was as large as two fists and contained at least half a pound of pure gold. It was sent to Denver to be exhibited. The richest mine in the San Juan is the Sunnyside Extension. It has a 40-foot winze, the ore taken out in the sink of which netted \$14,000, while the value of the ore opened up throughout the mine is simply wonderful. The product is mainly gold. The Auburn, opposite the village of Middleto in Tower mountain, is showing up well. The mine has 300 feet of development, all drifting on the vein. It is very desirable ore for smelting, the contents being 99 1/2 per cent lead and 90 ounces silver. Geo. Fisher, who has had the lease on the great Sheridan mine in Marshall basin, informs a reporter that he has secured an extension of the lease for three years more. A vast quantity of coal will be taken over the range to this and other mines in the basin this fall, and Mr. Fisher adds that they will be operated the coming winter on a more extensive scale than ever. All of the high-grade ore is now going to market by way of Silverton. The North Star on Solomon is in bonanza again. The drift is run between the two ore streaks, and about 20 feet from the shaft the vein was crossed, opening out three feet of solid gray copper worth \$300 per ton. Last year \$270,000 was taken from this shaft on the sixth level, but the water drove them out.

GLENWOOD.—The El Paso is erecting ore bins at its shaft-house and probably will begin shipping soon. The lessees of the Four Per Cent are still drifting south on the small streak of ore which was struck some time ago, and it has not yet opened sufficiently to make it of much account. The Adams mill is in operation again, running on low-grade ore from the Brooklyn shaft. The Adams has not increased its shipments much, but will begin to produce more ore this week. The lessees of the Mike and Starr are still working in the lower level under the ore body, doing development work in order to command it. A raise from the lower level is expected to run into the ore some time next week. The Virginus is shipping now 60 tons of argentiferous iron per day. The iron is of very low grade and much of it nets over \$2 per ton. The Virginus should pay good interest on its purchase price out of its own iron body alone. The winze from the lower level of the Minnie went down 25 feet, when water began to run in and further sinking was prevented. This makes the total thickness of the Minnie's ore body at this point, so far as opened, about 150 feet. No further prospecting work will be done in this direction for the present, but eventually one of the shafts

will be sunk deeper. The Minnie is at present shipping about 75 tons of ore per day. Shipping will be increased very soon if the price of lead holds above \$1 25. The Colonel Sellers mine is said to have more ore in sight at the present time than at any time for five years. The character of the ore now being mined is less zincy than it has been for some time, and carries a higher percentage of lead. Very good lead ore is being taken from all parts of the mine, which is shipping 75 tons of ore per day; average 40 per cent lead. The concentrating-mill is running regularly and dressing about 50 tons of low-grade ore per day; assays from 12 to 15 per cent ore. The mill should be very profitable when supplied with this class of ore. It was formerly run on ore not one-fourth as good. Three and one-half tons are concentrated into good, and about 15 tons of concentrates per day are produced.

ABOUT SILVER CITY.—*Enterprise*, Aug. 31: The Mountain King at Pinos Altos is showing up well, a vein having been found that seems extensive and permanent. The Flagler is now running night and day, smelting about 17 tons daily of copper ore from Ilanover. It is expected that 27 tons will soon be the daily work. T. B. Pheby kept three Chinamen working at the mill and on the dumps but a few days, and did not intend to keep them permanently. It would be a misfortune for any considerable number of Chinese to get a hold in the mines. McKnight & Warnock's Silver Belt in San Domingo gulch, Pinos Altos district, is down 32 feet; has a 3-foot vein of silver-bearing ore, samples of which are as rich as can be seen anywhere, being plastered over with native silver. A streak of free gold ore has been encountered at 31 feet. The Socorro *Chief*, speaking of parties who search for the Adams diggings, says: One the *Chieftain* knows of, and it has been out for the past six months under the captaincy of Pioneer Patterson, an intimate acquaintance of Adams and a firm believer in the story of the lost treasure. Mr. Patterson is a thorough mountaineer and practical miner, and if the Adams diggings exist he will find them. A carload of ore from the Oakland mine, in the Silver Creek district, has been sent to Denver. It is expected to average \$250 per ton. The mine shows a 4-foot ledge, and a carload of ore will be shipped weekly hereafter.

DAKOTA.

CALEDONIA.—*Deadwood Pioneer*, Sept. 5: The 20 new stamps, making in all 80 with which the mill is now equipped, begin dropping on Caledonia ore this morning. The increased milling capacity cannot fail to add appreciably to the monthly bullion output of the property, while the additional cost for operating will be insignificant.

IDAHO.

THE SIERRA NEVADA.—*Wardner News*, Sept. 1: The chief work now in progress in the Sierra Nevada mine is confined to tunnels A and B. In the last named a large amount of stowing work is being done, and a number of men are employed in opening up new ground. As depth is attained a much higher grade of ore is encountered and the recent developments are of a most satisfactory nature. The water in the ditch is very low just now, and a supply from the mine has of late been utilized in running the works. Fifty-one men are on the company's payroll.

PALMER FRACTION.—The Palmer Fraction adjoining the Sierra Nevada is a claim that promises in the near future to yield rich returns to its owners. Their shaft is down 124 feet; and at a depth of 118 feet cut the vein.

CONCENTRATING WORKS.—The massive machinery of the Poorman concentrating works was put in motion for the first time last Monday. Everything worked like a charm and Superintendent Clark feels satisfied he has a mill at his command that will meet the requirements of the great ore-producing property under his control. The hoisting machinery for the mine arrived from New York on Wednesday and will be brought into requisition immediately. The force engaged in the construction of the Granite concentrator on Canyon creek has been reduced to six men, the company not desiring to have the work completed until the erection of the tramway is finished.

NEW MEXICO.

MINES AT ASPEN.—*Republican*, Sept. 3: The Regent has awarded the contract for the handling of its output for 60 days to the Rust sampler, and is now delivering 75 tons a day. The contract calls for 4500 tons to be delivered within the time mentioned, and from the figures alone is to be derived a fair idea of the magnitude of the property. The grade of the ore is said to have been improved by the recent developments. The Aspen is handling nearly 70 tons of mineral that affords excellent returns each day. The ore bodies in the Mollie Gibson are increasing at each shift, proclaiming the property one of the largest that has been proven on Smuggler mountain. The assays indicate a variation in the grade of mineral from 50 to several thousand ounces, a portion of the vein being heavily impregnated with native silver. Manager Bulkeley of the Aspen Mining and Smelting Company is now handling large amounts of very fine-grade mineral that is being divided between several rival smelters. The Enterprise is extracting considerable mineral from the locality of the new strike. The output in all of the producers is said to be showing an increase the present month. The owners of the Cora L. are shipping some high-grade ore from superficial workings. The strike in the San Jacinto is improving with each shift, and the main ore-body is expected each day.

NOTES.—Silver City *Enterprise*, Sept. 7: The last car of concentrates shipped by the Mountain Key Company netted \$3809. A Mexican named Jose Saleva and two sons are washing out \$25 per day in one of the placer gulches of Pinos Altos. There are now regularly employed in the mines of Pinos Altos 414 men. The different payrolls amount to over \$40,000. Andy Stewart is said to be taking out good ore from the Peerless. As rich ore as has ever been taken out of the Bremen mine is now exposed in several openings, and the future of the mine was never more promising than at the present. Nick Rascom started for the Julian mine in Cow Springs district, to take out ore for the

Flagler works, on last Wednesday. An average sample of 150 pounds of the ore, made by the assayer of the works, gave returns of 12 1/2 per cent copper, \$15 in gold and 10 ounces in silver, and \$32 per ton is offered for the ore at the works. It again looks as though Georgetown is to push to the front as the banner camp of the county. Fully 100 men are employed in the mines. About 65 of this number are engaged by Thos. B. Pheby, while others are distributed on the different leases. The amount of ore taken out is surprising. Mr. Pheby alone producing fully \$1000 in silver a day, besides the concentrates he is making. Work is progressing slowly but very satisfactorily to the management at Telegraph. There are now 32 men on the payroll, and others will be put on as fast as possible. The greater portion of the work thus far done is on the Mother Lode claim, from which any quantity of low-grade ore can be broken, as the vein is about 8 feet in width. There are 22 men regularly employed on the Deep Down mine. In both drifts of the 200-foot level high-grade ore in quantity is being taken out. In the south drift eight inches of the richest ore yet found in the mine has been encountered, while in the north drift the vein is but six inches, but very rich. In the shaft there are ten inches of good ore. The run of 20 tons just completed averaged \$30 to the ton.

NOTES.—Kingston *Shift*, Aug. 25: The most important strike reported is that of the Charm, on the Sweepstakes hill, having found a contact full of rich ore. The Keystone on the North Percha and the Lady Franklin on the Bonanza hill, are both taking out ore from their deep-down shafts, and, with the Templar, never looked better. The problem as to whether ore was deep down in the Kingston camp has been solved. The Superior is preparing to resume work. Every mine that has ever shipped ore has it in sight to-day. The situation on the south, in the new Tierra Blanca precinct, improves, the Hornet and Log Cabin still being the center of attraction. The Superior is preparing to resume work with Gillette as superintendent. The Keystone looks better than ever. Ore on both ends of the lower level, which is 200 feet lower than the lowest workings on the Templar through the Equator tunnel, and still above water. A visit to the Enterprise mine gives a stranger the idea that we have a mining camp. The recent strike in the Templar and Keystone will certainly encourage all the mine-owners in that section, particularly the Iconoclast and Pride of the West, which join on the north and are supposed to be in the same belt. The Charm boys have struck the contact at the depth of 20 feet and find plenty of rich ore. John Johns and Dennis Findley truck a large body of ore last Thursday in their lease on the north end of the Hornet, which in breast is about four by seven feet. The Nevada Consolidated group of mines in the Black Range mining district, Sierra county, near Kingston, N. M., consisting of the Nevada, California, Path Finder and Veteran mines, has been purchased by a syndicate, composed of capitalists of Kansas City. This property has produced shipments of very high-grade ore and has paid for its discovery.

MONTANA.

MEAGHER'S MINES.—*Inter-Mountain*, Aug. 29: The Judge lead, situated on Mineral Hill, 15 miles east of White Sulphur springs, is rapidly developing into one of the best mines in Meagher county. The three men engaged in sinking a shaft on the ore chute are said to be hoisting \$1000 worth per day. The last accounts report ore on both sides of the Alice shaft, which will reach the depth of 100 feet this week. The Solid Silver, an extension to the Hidden Treasure, shows four inches of galena and over two feet of hard carbonate ore. The mining in the Castle mountains is steadily drifting toward Copperopolis, which promises to be the center of a very rich district.

NOTES.—*Mining Review*, Sept. 5: Coffee Bros. & Co. are engaged in hauling ore from the West Grass Valley to Silverman's sampling works, and have their ore-house full of fine carbonate and galena ore. The mine shows in the face of the 50-foot level two and a half feet of this same ore. A carload of ore was shipped about a week ago to Omaha from the Enterprise mine, located in the Stomple district, about three miles from Marysville. A cross-cut has been run which is in a fine body of ore. A new strike has been made in the Anna Maud mine at Strike. In the Carbonate mine, located three miles from Marysville, the tunnel is now in 225 feet, and the ore is improving with depth and running about \$60 per ton. Over in the gold belt east of Butte a number of mines have been worked, among them the Minnie Rand. This mine has paid from the grass roots. The Silver Spray mine, which has been idle for the past year, we understand will commence work shortly.

UTAH.

THE ONTARIO.—*Park Record*, Sept. 1: Work is progressing favorably at the 1200-foot level of the Ontario No. 2 shaft. The east drift is in over 130 feet and the ore body shows up well, though it is "pinched" a little since it was first struck. A flow of 200 gallons of water a minute is encountered, but it is pumped up to the 1000-foot level, where the Cornish pump receives it, without any difficulty.

MONTREAL DEVELOPMENTS.—The Montreal group, consisting of five claims in the lower part of Snake Creek district, is coming to the front as one of the bonanzas of the future. The property is worked by a tunnel running along the course of the ledge, and it is in about 335 feet already. At a point about 275 feet in from the mouth two crosscuts of 20 feet each were run, but no pay streak was encountered.

CAMP CROSSCUTS.—The Anchor tunnel is in about 450 feet, over two-thirds of the way. The Apex is making a shipment of over 50 tons of first-class ore through the Mackintosh sampler. Geo. Pierson's Red Oxide tunnel in Pioneer ridge is showing up well. The vein in the face is being followed up. Work in the Parish & McLaughlin shaft is confined now to crosscutting the formation in the lowest level. John Oldham is driving a tunnel on one of his claims on the north side of Bonanza flat. It is in about 30 feet, and in the face of the tunnel a fine seam of ore is exposed.

ORE AND BULLION SHIPMENTS.—During the week the Crescent shipped 249,200 pounds of concentrates and 290,650 pounds of first-class ore. For

the week just ended the Mackintosh sampler received 472,300 pounds of Ontario ore and 64,370 pounds of Daly ore. During the past week the Ontario shipped an aggregate of 49 bars of bullion, containing 28,111.12 fine ounces of silver. The product of Daly bullion from the Marsac mill for the past week was as follows: On the 26th, 10 bars, 10,512 ounces; 29th, 9 bars, 9300 ounces; and this morning, 8 bars, 8768 fine ounces of silver.

MINING MATTERS.—*Park Record*, Sept. 8: J. M. Kennelly has finished developments for the present on his Scott Hill claims, and he has put his men to work on the Rosebud, near the Great Basin. Buchanan's gold strike over on the Provo river is panning out a sort of silver lode. A late assay from there showed some 50 ounces of silver with no gold. The event of the week in mining circles is the rich strike in Woodside canyon. A couple of weeks ago Messrs. Drake, Farish & Williams took a year's lease on the Woodside property, owned principally by Hon. E. P. Ferry, and a thorough examination of the upper tunnel workings was made. A small seam of ore was traced toward the surface, and while Mr. Williams was returning from the Morgan lake with Mr. Drake, the supposed course of the ledge was traversed. As romantic as it is, it is nevertheless true that a boulder was broken open carelessly, and it was a surprise to the finders when they saw what it contained. A few minutes' digging there showed that it was the outcropping of a vein. Work has been pushed on this new discovery the past week, and when a reporter of the *Record* visited the spot on Thursday the vein had been stripped for 10 or 12 feet. The body of ore is about five feet wide and there is every indication of permanency, for the lime footwall and quartzite hanging are, as far as can be seen, regular and well-defined. Already the leasers have taken out about six tons of first-class carbonates that will assay about 100 ounces silver and 45 per cent lead to the ton, and shipments to the sampler will be commenced soon. Indeed some picked samples of the new find assayed as high as 600 ounces silver to the ton. There can be no doubt of the genuineness of the find, but the wonder is that it was not discovered before, because there is hardly a rod of ground up there that has not been slept on and walked over time and again.

WASHINGTON.

THE SALMON RIVER QUARTZ MINES.—*Oregonian*, Aug. 24: These mines are located on the eastern slope of the Cascade mountains, in a portion of the Moses reservation which was recently thrown open by the Government, and extends from the British boundary line to the Columbia river. Active developments in two shafts were being done on the War Eagle, owned by St. Paul capitalists, the same ore being found, and the two shafts will be connected with that of the Idaho mine for work and ventilation purposes for the mutual benefit of both companies. The joint tunnel will be 600 feet in length.

OTHER RICH MINES.—Perhaps the richest mines discovered thus far in this belt, known as the Ruby district, are the Fourth of July, First Thought and Lenora. Rich chlorides are present in the Lenora, although not in defined bodies. It is scattered through the ore, but if a body of the same character develops, it will prove very rich. This ore on the 15-foot level runs from 125 to 300 ounces of silver per ton.

THE FAMOUS ARLINGTON.—In the same mountain, 1 1/4 miles distant, a tunnel is being driven on the 200-foot level to tap the Arlington mine. There is a continuous chain of locations on the same lode from the Arlington on the south, a distance of over three miles, to the west fork of Salmon river. On the opposite mountain, and just above Ruby City, a cross-cut is being run to develop the Anaconda (a very rich mine on the surface) on the 150-foot level.

WANNICUT LAKE ORES.—The Wannicut lake ores are chie fly free-milling gold, a little silver being present. The veins are strong and well defined, often cropping throughout two or three claims. The most prominent properties are the Jessie, the Pinnacle and Rainbow, and the Black Bear and War Eagle. Every condition for mining and milling is admirable in this region, the winters being short and mild, and agricultural supplies abundant in the vicinity. Mule deer are very plentiful, as well as grouse and water fowl. A greater diversity of mineral lakes would be hard to find anywhere. The prevailing formations are granite, syenite, porphyry, lime and slate.

THE RICHEST SECTION.—North of the west fork of Salmon river is Mineral hill, in and about which are located the Conconelly mines. A great deal of development work has been done here, many of the properties having from 100 to 150 feet of work on ore. The veins are much smaller than in the Ruby district, but the ore is of higher grade. A 60-ton concentrator has been erected at Conconelly City, which lies immediately under Mineral hill. The most prominent properties of this vicinity are the La Una, the Lone Star, the Eureka, the Tough Nut and Homestake, the John Arthur, Lady of the Lake, Okanagan Chief and Sunrise. The first shipment of ore has just been made by T. L. Nixon from the La Una to San Francisco. The ore of this vicinity runs from 600 ounces of silver per ton, and it is confidently expected that the present shipment will yield 300 ounces per ton. An ounce of silver is worth 90 cents. There were 20 tons of ore in the shipment. The La Una product is a gray copper ore.

FACILITIES FOR REACHING THE MINES.—Last year from five to six days' staging was necessary to reach these mines from the rival outfitting points, Ellensburg and Spokane Falls. This season the time has been reduced on the Ellensburg route by steamboats on the upper Columbia to less than 30 hours. The present travel consists of 32 miles staging to Rock Island rapids, thence by steamer to Lumben's Landing, six miles above the mouth of the Okanagan; thence 30 miles by stage. The fare is \$16.50. On Rock creek, the Cariboo, owned by Spokane Falls and Portland people, is being developed with very satisfactory results, the ore sampling upward of \$80 in gold and silver per ton. Twelve miles from the properties last named, on Boundary creek, just north of the line, is located the None Such. This property is from two to three feet in width, and crops for over 1000 feet. It occurs between hills of porphyry and diorite. It is a milling and concentrating ore. Seven sample tests from this mine ranged from \$17 to \$575 per ton, making an average of \$160 per ton.

ATTENTION, GOLD MINERS!

WE ARE SELLING

Silver-Plated Amalgamating Plates

For Saving Gold in QUARTZ, GRAVEL and PLACER MINING,

At reduced rates. Get our prices. Three thousand orders filled. Fifteen medals awarded. Our plates have proved the best, and far superior to others in weight of silver and durability. Old mining plates replated. These plates can also be purchased of JOHN TAYLOR & CO., cor. First and Mission Sts.

SAN FRANCISCO GOLD, SILVER and NICKEL PLATING WORKS,
E. G. DENNISTON, Proprietor.

653 & 655 Mission St., San Francisco, Cal.

NOTICE.—Our Silver Plated Plates have always proved as represented. We have been manufacturing them for 20 years, and use only the best Lake Superior Copper and Refined Silver. Comparing our plates with those of other manufacturers, after repeated tests, we can safely guarantee much better plates for the same money. Our plates are used by all the prominent mining men on the Pacific Coast. SEND FOR CIRCULAR.

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; is in successful operation and we guarantee its work as represented.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

FRISBEE-LUCOP MILL COMPANY,

GIDEON FRISBEE, Manager, - - - 461 Howard St., San Francisco.

HOOKER & LAWRENCE, Gen'l Ag'ts, 145 Broadway, New York.

THE RAND DRILL COMPANY,

23 Park Place, New York.

We are now so situated with our new works as to offer to the miners of the Pacific Coast SMALL AIR-COMPRESSING PLANTS at such prices that almost any small mine can afford to put in power drills if they have none in use.

By our NEW AND PATENTED SYSTEMS (by which the duty or performance of drills is not reduced with use) it is no longer necessary PLANTS IN THIS COUNTRY,

and has patterns for all sizes up to 40-inch diameter of cylinder. In respect to capacity IN SPEED OF DRILLING, perhaps it is in order to say that in EVERY AUTHENTIC CONTEST for speed yet initiated, the RAND DRILLS have, without exception, BEEN VICTORIOUS. This fact, coupled with another important one, that the drills use much LESS AIR and cause LESS REPAIRS, has won for them nearly all of the Eastern mining trade, which has kept their works always busy.

Since the reasons which formerly restrained us from the California market no longer exist, we are now in the field for the business.

SPECIAL ATTENTION is called to the latest designed sectional Compressor just built for the Batopilas mine in Mexico, and to the Compound Engine Compressor built for the Anaconda mine in Montana.

Send for Circulars and Price List.

MARSHUTZ & CANTRELL.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-fourth of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or any other ore crushing machines now before the public.

Mining Turbine Water Wheel.**

These Wheels are designed for all purposes where limited quantities of water and
high heads are utilized, and are guaranteed to give more power with less water than
any other wheel made. Being placed on horizontal shaft, the power is transmitted
direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in
capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the
ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost,
by applying to the manufacturers.

The BUYERS' GUIDE is
issued March and Sept.,
each year. It is an ency-
clopedia of all useful infor-
mation for all who pur-
chase the luxuries or the
necessities of life. We
can clothe you and furnish you with
all the necessary and unnecessary
appliances to ride, walk, dance, sleep,
eat, fish, hunt, work, go to church,
or stay at home, and in various sizes,
styles and quantities. Just figure out
what is required to do all these things
COMFORTABLY, and you can make a fair
estimate of the value of the BUYERS'
GUIDE, which will be sent upon
receipt of 10 cents to pay postage.

Mining in Fresno County.

The indications are very promising that Fresno county will ere long take something like a prominent rank among the mining counties of the State. For several years some little mining has been done in the mountain regions of that county, and during the last two years several quite promising mines have been opened—both gold and silver.

The reported richness of the silver mines has recently attracted the attention of several successful expert miners of Montana. During the past week Messrs. Henry Klein and John Shopp and their mining superintendent, Mr. J. L. Waggoner, favored us with a call and assured us that from their intimate knowledge of silver mining in Montana, they entertained high hopes of the future of that portion of the country where they are operating upon their own property, under the name of the Star Mining Company, near the summit of Mount Raymond. They have already erected reduction works, and have just made arrangements to put up an elevated cable tramway, to carry their ore 7600 feet from the mine to their reduction and concentrating works, at a point lower down the mountain, where they have a fine water-power.

The vein is a very heavy one, carrying galena with a fair yield of gold and silver. They are now taking out about 200 tons per day, at a cost of about \$1.50 per ton, delivered at the mill, where it is concentrated for 50 cents per ton. The concentrated ore will be delivered at the railroad for \$10 per ton. It will be shipped to San Francisco or Denver for treatment.

There are quite a number of mines in the neighborhood awaiting the result of the work upon the Star mine. Small samples have been sent to this city for treatment, with very satisfactory results. Should the anticipated success be met with in the Star mine, it will no doubt be the means of introducing a large amount of mining capital into that portion of the country.

The Copper King mine, located about 28 miles east of Fresno City, has been taking out what is pronounced very rich ore for some time. Mr. J. F. Hutchinson, the lessee, is now about shipping a carload to this city. It is believed that this ore contains a workable percentage of gold and silver. Should it turn out as well as expected, it will at once be worked for all that it is worth.

There are already several San Francisco and English firms engaged in mining in this county, with mills of from five to ten stamps, and others are in contemplation.

Between gold, silver and copper in her mountains, and the rich agricultural products of her valley land, Fresno bids fair to become one of the richest and most productive counties in the State.

Mining Share Market.

Operations at the stock boards remain in statu quo—not better nor worse than they were one week ago. Variations in prices and volume of business have been few and of microscopic proportions. The minnows continue to swim around shyly, the more fortunate brokers getting now and again what the patient angler would call “a glorious nibble.” Nevertheless there is all the while a little being done, and some predict while all hope for an early improvement in the market. Meanwhile the bullion output continues steady and up to the full complement of late. There has occurred during the past month some falling off in the Comstock product; but this being due to lack of water for running the mills on the Carson river, will probably prove to be only temporary. While it lasts the deficiency is being nearly made good in other quarters, though many of the quartz-mills in California are suffering from the same cause.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports: Con. California and Virginia, Sept. 12, \$123,679; Daly, 4, \$9519.

THE Florence (A. T.) Enterprise says: The eviction of the settlers from the Maxwell grant of New Mexico and Colorado is being forthrightly resisted and bloodshed has already occurred. The sympathies of the people of the State and Territory are with the settlers.

A NEW YORK paper declares that a gang of expert thieves are systematically robbing the mails between that city and the West. All efforts to trace the loss of many thousands of dollars already taken have proved fruitless.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in DEWEY & Co.'s Patent Office Library, 220 Market St., S. F.

FOR WEEK ENDING SEPTEMBER 4, 1888.

- 388,815.—CAR COUPLING—John Bound, Tucson, A. T.

- 388,978.—DEVICE FOR LIFTING GOODS FROM SHELVES—J. H. Jeffrey, Crescent City, Cal.
- 388,980.—STATION INDICATOR—John Knight, S. F.
- 388,986.—SIDEWALK CONSTRUCTION—J. McGillivray, Sacramento, Cal.
- 388,988.—HYDROCARBON BURNER—Samuel McMurray, Alameda, Cal.
- 388,993.—VENTILATING MANHOLES OF SEWERS—T. W. Morgan, Oakland, Cal.
- 389,007.—WINDMILL—J. S. Philpott, Windsor, Cal.
- 389,020.—NEUTRAL COMPOUND—A. Sommer, Berkeley, Cal.
- 389,021.—COMPOUND OF TALLOW AND CHLORIDE OF SULPHUR—A. Sommer, Berkeley, Cal.
- 388,932.—WINDOW—H. Tintrop, S. F.
- 389,122.—ACTUATING STATION INDICATORS—W. A. Turner, S. F.
- 18,583.—DESIGN FOR PINCUSHION—G. F. Atkinson, S. F.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

DEVICE FOR LIFTING GOODS FROM SHELVES.—John H. Jeffrey, Crescent City, Cal., assignor of one-third to Henry Albert of same place. No. 388,978. Dated Sept. 4, 1888. This device, as its name implies, is to be used for the purpose of handing down goods from elevated shelves. It consists essentially of a long handle or pole, having connected, with its upper end, peculiarly arranged jaws for gripping the package of goods, and a table on which the package rests in handing it down, the jaws and the table being operated from below by means of a depending wire or rod, guided by the handle or pole.

WINDMILL.—James S. Philpott, Windsor, Cal. No. 389,007. Dated Sept. 4, 1888. The novelty in this invention consists in the simple but peculiar connection between the vane and the turntable, whereby when the former is forced around by the wind, in order to throw the wheel into the wind it not only turns on its pivotal center, but rises also, at the same time, on another pivotal center, and returns from this position by its own gravity. In this movement it keeps perfectly straight by means of a peculiar connection with the middle of the vane providing for its proper support and effecting its operation without undue strain.

SAFETY COVERS FOR POISON BOTTLES.—Ferd O. Bratton, S. F. No. 389,051. Dated Sept. 4, 1888. This is a very neat device for calling the attention of the person to the fact that the bottle contains some injurious material. It consists of a complete cap which is fitted over the cork of the bottle and embraces the neck. The cap is provided with a couple of spring arms which embrace the neck of the bottle, and are fastened in a small opening or slot in one edge of the cap. The cap is thus readily applicable to the bottle, and yet is so fastened that while capable of easy removal, the operation is such as to require the particular attention of the handler, thereby giving him full notice of what he is about.

HYDROCARBON BURNER.—Samuel McMurray of Alameda, assignor of one-half to Edward Donnelly, S. F. No. 388,988. Dated Sept. 4, 1888. This burner is of that class for using liquid hydrocarbons, in which the parts are so arranged as to provide for the union of the hydrocarbon with air and steam, whereby the former is atomized or vaporized. The invention consists in such an arrangement of the parts as will provide for the introduction and union with the hydrocarbon in a heated state of the air, also in the heated state, and superheated steam. The object of this construction of the burner is to provide for the most complete and perfect atomizing or vaporizing of the liquid hydrocarbon, which object is attained by the union of the hydrocarbon and air, both in the heated state, with superheated steam.

LAMP-SHADE HOLDERS.—Wm. E. Brown, assignor of one-half to Nathan Dohrman & Co., S. F. No. 386,686. Dated July 24, 1888. This holder consists of a central hub or ring, to which the arms which support the

shades are connected; the hub or ring being so threaded at each end that it can be readily interposed between the lamp-bowl and the burner. It screws into the lamp-bowl collar, and the burner screws within it. The object of the invention is to make a holder which may be readily applied to any form of lamp, independent of the shape or construction of its burner, its chimney gallery, or other portion to which the ordinary shade-holder is usually attached. Lamps differ so much in the parts above mentioned that it is the custom to adapt a particular shade-holder to a particular form of lamp, and the shade-holder is generally inapplicable to any other form. But this holder, by screwing it into the lamp-bowl, and receiving in itself the lamp-burner, is adapted for any form of lamp, and can be used without interference with the removal or replacement of the burner. The arms, although they may be secured directly to the main ring or hub, are preferably secured to a ring which fits around the main ring or hub, so that the arms, under certain conditions, as when they have to be made of a peculiar shape, may be readily turned so as not to interfere with the insertion of the burner.

DEVICE FOR OPERATING STREET OR STATION INDICATORS.—Wm. A. Turner, S. F. No. 389,122. Dated Sept. 4, 1888. The object of this device is to prevent the actuation of the indicator by obstructions which may be accidentally present upon the track. In the appliances which have heretofore been used for operating these indicators, a single obstruction serves to operate the lever attached to the car, whenever the car passes the point where the tripping block is fixed; and through this lever the indicator card or device is exhibited. The objection to this is, principally, that it is liable to be actuated by obstacles accidentally placed on the track, in which case a false record is given. This invention overcomes this defect in the ordinary apparatus by the arrangement of levers in sets of two or more, and tripping blocks or obstructions correspondingly fixed in pairs or series in the proper intervals upon the roadway, so that the levers shall be actuated simultaneously, and if less than all the levers are moved then the indicator will not be affected thereby.

VENTILATING MAN-HOLES FOR SEWERS.—Thomas W. Morgan, Oakland, No. 388,993. Dated Sept. 4, 1888. This ventilator, which is adapted for man-holes for sewers, consists of a supplemental flue or chimney built in the wall of the vertical man-hole, and connected at or near its lower end with the man-hole. The top of the flue communicates through an opening in the side of the man-hole curve or cover, with the space just below said cover, a pan being arranged under the cover to close the main opening, thereby causing a draft or current of air from the sewer to go through the flue. The supplemental flue or passage is filled with charcoal or other disinfectant substance, and the gases arising from the sewer passing up the man-hole, will enter the flue through the lattice-work or grated opening below, and rising through the material of the flue, will again return into the man-hole above the pan through the top opening, and will thence escape into the open air. A free escape is thus provided for the gases, and if desired a means for purifying them, before they escape; while by means of the cover or pan within the curb, obstructing bodies are prevented from entering the man-hole.

SIDEWALK AND SIMILAR CONSTRUCTION.—John McGillivray, Sacramento, Cal., assignor of one-half to John R. Watson, same place. No. 388,980. Dated Sept. 4, 1888. This invention has to do with the construction of sidewalks, floors, ceilings, etc., and it consists essentially in a peculiar and novel girder for supporting the material of the sidewalk. It consists, also, in connection with the girder, of peculiarly ar-

ranged supporting planking or plating, which may be either temporary or permanent. The girder itself has, in cross-section, the shape, approximately, of an isosceles triangle, with the apex above. From the base of the girder project flanges on which the planking or plating rests, the sides of the girder being held together by cross-ties. The sloping sides of the girders act as wedges for supporting the material so that the usual supporting arches of brickwork may be dispensed with. This construction will permit of the ready removal and repair of any portion of the sidewalk or floor without having to remove the entire section. For a ceiling, the planking is bolted up under the girders instead of resting upon their base flanges.

New York Metal Market.

Telegraphic advices dated Sept. 13th give the following New York prices:

BAR SILVER—94 1/2c per oz.

BORAX—90.

COPPER—LAKES—\$17.50.

IRON—No. 1, \$22.00.

LEAD—\$5.00.

TIN—\$23.00.

The following is the latest by mail from the "New York Metal Exchange Market Report":

COPPER—Steady, spot closing at \$16.70/16.85. Transferable Notices (Lake) issued at \$16.50/—.

LEAD—Active, at \$4.92/—, spot. Transferable Notices issued at \$—/—.

TIN—Closed firm at \$21.50/22.00.

Prices generally ruling for metals not regularly dealt in on call at the N. Y. Exchange, covering extremes of buyers' and sellers' views. All prompt delivery. Australian Tin, —/—; Billiton Tin, —/—; Banca Tin, —/—; Baltimore Copper, \$14.75/15.00; Orford Copper, \$15.25/16.25; P. S. C. Copper, —/—; Foreign Lead, \$4.00/5.00; Foreign Spelter, \$5.40/5.50. Antimony, \$9.75/13.50.

Please Remit.

Too large a number of our subscribers are in arrears on this paper. Now that we have been a little overkind to such, there is the stronger reason that they should make an extra effort to remit the amount due us for subscription without further delay. We have been very earnest and sincere in presenting a paper to each and every one of our subscribers well worth the price asked for it when paid in advance, and in justice to ourselves we must now insist upon all subscribers in arrears paying up. While to each individual the amount is small, collectively it is large to us, and we are obliged to urge settlement.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3.00 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

G. W. LEONARD—Arizona Territory.

A. F. JEWETT—Tulare Co.

C. E. WILLIAMS—Yuba and Sutter Co.'s.

JOHN L. DOYLE—Oregon, Montana and Idaho.

F. B. LOAN—Nevada State.

H. O. PARSONS—Oregon and Washington Territory.

M. C. BOW—Butte and Colusa Co.'s.

M. S. PRIME—Alameda Co.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party, requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

Sampling Works for Sale.

The works are situated on A. & P. R. R., Calico Mining District, Daguerre, Cal., and contain a first-class Engine and Boiler with Ore Crusher and other machinery, Platform Scales, Mill Scales, Assaying Outfit, etc., all nearly new. Also upon the premises an office building and a comfortable dwelling house (portable). The above can be had at a bargain. Apply to GILLESPIE & CHILDS, 123 California street, San Francisco.

This paper is printed with Ink Manufactured by Charles Eneu Johnson & Co., 500 South 10th St., Philadelphia. Branch Office—47 Roca St., New York, and 40 La Salle St., Chicago. Agent for the Pacific Coast—Joseph H. Dorsey, 529 Commercial St., S. F.

ELECTRIC DEVELOPMENT COMPANY.

Incandescent & Arc Electric Lights.

Electric Motors, Dynamos, Trancams, Elevators, Signals and all kinds of Electrical Systems or lighting and transmission of power, either direct or with storage Batteries.

For Mines, Hoisting Works, Mills, Reduction Works, Indoor and Outdoor Illumination of every kind. Gas, Oil and Candles superseded by the

EDISON INCANDESCENT LIGHT,

The only complete and satisfactory incandescent system. Lights require no attention and are under complete control. Over 500,000 lights in use in the United States. SELF-REGULATING ARC LIGHTS turn night into day and afford a means of working the whole 24 hours; invaluable to contractors and others to whom time is an object. Estimates and designs on application.

Dewey & Co.'s Scientific Press

Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintances with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

\$1,000 CHALLENGE!

THE FRUE ORE CONCENTRATOR
OR VANNING MACHINE.

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS
(\$575.00) F. O. B.

OVER 1400 ARE NOW IN USE. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at 220 Fremont Street, San Francisco.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1888.

DEAR SIR:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered twenty more of your machines for immediate delivery. Yours truly,

THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners having been started gave such satisfaction that 44 additional Frues and more stamps have been purchased.

Protected by patents May 4, 1869; December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 13, 1883. Patents applied for.

\$1,000 CHALLENGE ACCEPTED,

PRICE, FIVE HUNDRED AND FIFTY DOLLARS
(\$550.00).

THE
"TRIUMPH" ORE CONCENTRATOR.

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

THE DOUBLE "ECONOMIC" STAMP MILL.

We have here the Stamp Mill in a cheap and simple form. The high drop of the old stamp is more than compensated for by the great weight (1200 lbs. each) of our stamps, and the rapidity (300 strokes each per minute) with which they run. There are 4 shoes in each stamp, so that there are 4800 strokes of the shoes on the dies per minute. Less power is required than in any other mill to do the same amount of work.

The Mortar has screens at both ends, giving ample discharge. There are no cams or tappets to wear or be adjusted. The stamps adjust themselves as the shoes wear.

AN AUTOMATIC ORE FEEDER

Goes with each Mill. We also have a suitable

Rock Breaker.

Several Mills are now in the mines doing excellent work. The "Economic" is not only a mill for small mines, but we believe it is destined to SUPERSEDE THE OLD STAMP IN MILLS OF THE LARGEST CAPACITY.

Comparative Mythology.

An interesting lecture was given before the Academy of Sciences on Monday evening last by Adley H. Cummins on the subject of comparative mythology. Mr. Cummins said that many of the mythological tales had no ulterior aim but to entertain, simply appealing to the craving in humanity for fiction. They were tales which grew up around some half-developed savage custom. He proceeded to give an interesting account of the religion of the Aryans, their gods and surroundings; of the sun myths, Daphne and Apollo; Daphne, the first love of Phoebus; of Alphens, the river-god, and the nymph Arethusa; of Endymion and Selene,

Engine Lathes.

The engraving shown on this page represents the Lodge Davis & Co. engine lathe. They are made in six sizes to swing 17, 19, 21, 24, 27 and 38 inches, and of any length bed. The out given represents the 24-inch and 27-inch lathes, which, though massive in size, are as easily handled by their special conveniences as the smaller sizes.

Nothing but the best material and workmanship is used in their construction. Spindles made from high-grade special steel and are hollow, and the boxes are made from the best phosphor bronze being provided for taking up wear and for easy and constant lubrication.

lets to suit each and every size wanted. With each lathe is sent the following attachments, which are usually furnished only as extras by other manufacturers: Compound rest, full-swing rest, taper attachment and automatic stop for carriage. These lathes are also provided with the usual steady and follower rests. The agents for their sale on this coast are Parke & Lacy, Nos. 21 and 23 Fremont street, this city.

MINERS' CABINS IN ALASKA, especially for winter occupation, have to be more substantially constructed than the same class of shelters are in the Sierras. The Juneau *Free Press* says that the miners there, however, find no difficulty in keeping their cabins warm and

Copper Ore in Heaps.

The roasting of ore in heaps or mounds is a slow but comparatively cheap process. The method varies slightly in different countries. In this country furnaces are mainly used for ores requiring roasting, but when heaps are roasted a single heap usually contains 30 to 40 tons of ore, and requires five or six weeks for the operation. In preparing it, a bed of cordwood about 16 feet square is laid as the base of the pyramid that is to be composed of ore. Directly upon the ground a course of thick billets of wood is laid, the sticks being parallel, a little distance apart to permit passage of a current of air. Above this, other courses of wood are laid

THE LODGE DAVIS & COMPANY ENGINE LATHE.

Orpheus and Eurydice; Varnna, Indra, Thor, Heimdol, Bragi, Oegir; Surya, the dweller in the globe of the sun; Aphrodite, who arose from the sea; Agni, Vulcan, Prometheus, Hermes and other gods of ancient lore of the heavens, the earth and the under world. Referring to the god Thor, who, in the tales of mythology, sat in the form of a raven on the shoulders of Hugin and Munin, the lecturer said he might be taken as a fit emblem of the newspaper of to-day. The god looks into the doings of men and of all things, and in many of the Vedic hymns we are borne entirely out of the realms of mythology, and man communicates directly with his Maker. By his ordinance the moon shines in the sky, and the stars which are visible by night disappear on the approach of daybreak. Neither the birds flying in the air nor the rivers in their sleepless flow can attain a knowledge of his power or wrath. His spies behold both worlds. He himself has a thousand eyes. He knows the flight of birds in the sky, the path of ships on the sea, the course of the far-sweeping wind, and perceives all the hidden things that have been or shall be done.

The live heads are wedged their entire length and not weakened by cutting to make room for reverse plate, as no reverse plate is used. All feeders are reversed in the apron. Tail stocks have set over and are particularly solid and substantial, with heavy spindles and centers and nuts and clamping bolts of steel.

The lead screws are steel, extra large, placed directly under the front, V, on which the tail-stock slides, are inside of bed and covered, taking hold of the carriage in the center of its weight, and directly under the line of strain when cutting screws.

The dog shown on the bed may be set and clamped at any point, and will then form an automatic stop for the carriage. This is quite a feature where large quantities of work of one kind are being done, besides making it very handy to drop rack pinions out if desired when cutting screws. No worms or worm gears are used, consequently all feeds will reverse instantly without losing a fraction of a revolution.

The following rest is provided with means of adjustment so that any size shaft within range may be handled without stopping to make col-

comfortable, as they make use of Russian ovens, which are very simple to build, as they are made of stone, in the shape of a large box-stove, from three to four feet long inside, from 18 to 20 inches wide, and the same in depth, with an iron plate on top to cook on. The chimney is built of the same material. Miners who wintered here last winter and the previous winter went out every day to out their regular firewood, and so far no severe cases of frozen limbs have occurred. Indians travel and live in brush-houses all winter. They subsist chiefly on dried moose, caribou meat and fish.

A RAILROAD TO THE LIVERMORE COAL MINES. A survey for a railroad from Livermore to the coal mines, a distance of about eight miles, is now being made by the Livermore Coal Mining Co., and work will be begun within 90 days. The company is now working day and night with three shifts of men on their incline, and have a four-foot vein of good clean coal.

The wild gooseberries which grow plentifully in the neighborhood of Truckee are pronounced better than the tame fruit.

more closely and crosswise, forming a bed five or six inches thick, requiring altogether about a cord of wood for a single heap. A wooden chimney or box-flue 9 or 10 inches square is set up vertically in the center, passing down through the bed of fuel and reaching above the top of the heap. A small quantity of charcoal is put in at the bottom of the box or chimney, and the heap is ignited when ready by setting fire to the coal.

The ore is formed into a heap about four or five feet high on this foundation and around the central chimney. The larger pieces are placed on the inside and the whole covered on the outside by a layer of fine stuff. This is so disposed as to control the rate of combustion, promoting it if too slow in any part by opening a passage for the draught, or checking it if too rapid by covering more closely. The heaps when burning require only sufficient attention to insure a proper rate. If allowed to burn too rapidly, the ore slags; or, if too slowly, the calcination is imperfect and the fire may go out altogether, requiring rehandling, with a loss of time and money. Tailings, owing to their fine condition, cannot well be roasted in heaps.

The Russell Process.

Its Practical Application and Economic Result.

(Continued from our last.)

G.—Mechanical Treatment of the Products.

The precipitated sulphides are removed from the three precipitating-tanks for solution about once in three days, and the precipitate from the wash-water tanks at the same time if the wash-water has been precipitated by sodium sulphide, otherwise, usually only once a week. To remove the sulphides, the clear solution is decanted by means of the surface discharge as low as possible. The gate or valve on the rear of the precipitating-tanks is then opened, and the sulphides allowed to run out into the trough or launder leading to the tank for the storage of sulphides. The sulphides are permitted to settle in this tank, and the clear solution again decanted, so as to save running it through the press. The storage-tank, of the size given in the drawing, will hold the sulphides for one week's run, or about 700 tons of average ore. The sulphides may be more compact and reduced in bulk about two-thirds by using a jet of steam in the storage-tank. But, if this is done, the sulphides should be allowed to cool before pressing, for reasons explained further on. When the sulphides are to be pressed, all the valves between the storage-tank for sulphides and the filter-press (except the steam valves on top of the pressure-tank) are opened, so that the sulphides run freely through the pressure-tank into the press. In this way, two-thirds of the pressing is accomplished by gravity. While the sulphides are running into the press, the contents of the tank are occasionally stirred. When the press is so full that the solution comes only slowly from it, the valve between the sulphide storage-tank and the iron pressure-tank is closed, and as soon as the liquid in the pressure-tank has sunk below the level of the small valve on the side of the pressure-tank, three or four inches below the top, steam at full pressure is turned into the pressure-tank, until again the clear solution comes only slowly from the filter-press. It is best not to have the pressure-tank quite full when the steam is turned into it, as the solution would be heated by it, and a hot solution has a bad effect on the filter-cloths, so that they do not last more than one-half as long as they otherwise would. When the press is full, which is indicated by the pressure-gauge, as well as by the slow running of the clear solution from the press, the steam is turned off and allowed to escape from the pressure-tank, and the valve between the pressure-tank and the press is closed. The trough under the press, for conducting off the clear solution, is then removed, and a large iron pan about three feet wide, five inches deep and long enough to reach the whole length of the press between the legs, and having handles, is placed underneath the press. The press is then emptied by eliding the plates apart, and inserting a wooden (not a metal) paddle behind the cakes which causes them to drop into the pan. If distance-rings are used, they are removed from press by the handles and the cakes pushed out. When the press is first opened, a small amount of solution may run out, so that it is best to have the press set in a low tank, about two inches deep, and with a drain-pipe in one corner leading down to the sump under the press.

An 18-inch press has a capacity without distance-rings corresponding to about 250 pounds of dry sulphides per hour. The distance-rings are used when a greater capacity is desired, but the cakes will then contain a greater percentage of moisture.

The appearance of sulphides pressed at 150 pounds per inch does not indicate the presence of more than 10 per cent moisture, but they have in reality about 38 to 42 per cent. If these sulphides are dried in a reverberatory furnace, 0.5 per cent is likely to be lost in dust, and considerable labor is involved.

The best method of drying is by steam, in which there is no loss, and which requires only a nominal amount of labor. After being dried, which occupies two or three days, the sulphides are sampled on the iron floor beside the steam drier. The lead carbonate precipitate is pressed and dried in the same manner as the sulphides.

H.—General Remarks.

While the first wash-water is draining from the leaching-tank, preparatory to using the leaching solutions, cracks are likely to be formed, due to a slight settling of the ore. Before the leaching solutions are used these cracks should be filled up by smoothing over the surface of the charge with a wooden hoe. Also before and during the use of the extra solution, particular care should be used in filling up any cracks, especially around the sides of the charge; otherwise the effect of the extra solution may be decreased.

For maintaining a partial vacuum under the filter and thus accelerating the leaching and circulating the extra solution, the Aller lead-lined siphon pump is the best. It is applicable in all cases except on such extremely fine material as that at Silver City, another case of which is not likely to be found. The various sizes used are Nos. 2, 3 and 4 for leaching-tanks of 12, 14 and 16 feet diameter, respectively. If the leaching-rate without a vacuum is 6 to 8 inches an hour, the use of a siphon pump will usually double it. If only one-quarter to one-half an inch per hour, the use of a siphon

pump will often raise it to 6 or 8 inches. If a more positive vacuum is necessary, as was the case at Silver City, a No. 4 or 5 Knowles pump is used, one being sufficient for a mill of 50 tons capacity.

The lowest six inches of the charge of ore will sometimes show a less thorough extraction of the silver than the uppermost six inches, or the average of the whole charge. Therefore, than in starting new works, or if the value of the tailings is not satisfactory, the lowest six inches of the tailings should be sampled, and this should also be done whenever two methods of leaching are to be compared. If the tailings are sluiced out, the amount of water required for sluicing is 12 to 18 feet per ton of ore. But if roasted ore is being treated no additional water is required, as the last half of the first wash-water can be used for this purpose, being conducted down to and stored in a suitable tank near the fire pump.

III. Leaching Plant.

A.—General Remarks.—In Mr. Stetefeldt's paper on the Russell process in its practical application (Transactions American Institute Mining Engineers, Vol. XV) a short description was given of the plant required for the Russell process. This, however, in view of the many improvements made in the year and a half since the date of that paper, is not sufficient, especially as no plans and only one detailed drawing were given. The working drawings here given comprise the best features of five leaching plants, built especially for the process, and of the Sombrette plant now being constructed. With the exception of two minor details on the precipitating-tanks there is nothing given but what has stood the test of actual practical experience. The plant is entirely independent and complete as it stands and may be situated wherever convenient, without reference to the position of the crushing plant for raw ores, or for the crushing chloridizing plant for roasted ores, except as regards the easy transportation of the raw or roasted ores between the two plants.

Consequently when either one of the two above-mentioned plants for the preparation of the ore already exists in connection with amalgamation, the change to the Russell process can be made by the erection of the plant herein described without stopping or removing the amalgamation plant. The plant has its own boiler, and no engine is required.

TABLE XXIII.
CAPACITY OF THE PLANT PER DAY FOR VARIOUS ORES
AND TAILINGS TREATED BY THE RUSSELL PROCESS.

Name of ore.	Kind of material.	Weight of 1 cubic foot pounds.	Depth of charge in extra solution is made up in separate tank.	Corresponding weight of charge in tons.	Total capacity of plant per day if tailings are sluiced out.	Total capacity of plant per day if tailings are shoveled out.
Silver Ref.	Raw ore and tailings.	80.	55.	110	100	120

12 hours allowed for filling each tank.
2 hours allowed for emptying each tank if the tailings are "sluiced out."
12 hours allowed for emptying each tank if the tailings are "shoveled out."

Table XXIII gives the capacity of the plant for various raw and roasted ores and tailings in tons per day. This capacity may be further increased to the extent of 30 per cent by the addition of two more leaching-tanks, without making any change in the rest of the plant. On the other hand, it is not advisable to erect less than six leaching-tanks, since the remainder of the plant should be the same even if only four leaching-tanks were used. In the drawings showing the elevation of the plant, imaginary grade-lines are shown, one being about 25° and the other about 30°. These grades would be the most suitable, but they are by no means necessary. At Sombrette the same kind of plant is being constructed on a grade of only 12° to 15°.

The building containing the pressure-tank, filter-press, and steam-drier can be put in front of the sump for the solution pump and the storage-tank for sulphides, instead of at the side.

In the plan, the floor is supposed to be removed, but are shown in the elevation. Pipes, details and dimensions are omitted in some of the views, in order to avoid a complicated drawing, but are given in the others. Figures alongside of pipe-lines indicate the sizes of the pipes. All tanks of all kinds, and all troughs or launders are accessible on every side.

B.—Leaching and Storage Tanks and the Tank for the Preparation of the Extra Solution.

All the wooden tanks are usually of white cedar, but this material is not necessary, as was shown at Silver City, the tank lumber being obtained only a few miles from the mill, and put in position while comparatively green. Such a course is not, however, to be recom-

mended. The best plan, except for shipment to Mexico, is to order the tanks made in San Francisco, in diameter about two inches larger than as finally erected, ready to put up, with the exception of having no dowel-pins in the bottom and no gain in the staves. The sides of all the tanks are straight. In making the tanks, even if they have been set up in San Francisco, the staves are dressed to sweep of tank, and of such a length as to allow a 6-inch ohime.

The gaining of the staves, one inch deep, is done by hand. No dowel-pins are used in the bottom, but instead the sides are grooved and joined with a tightly-fitting tongue $\frac{1}{2}$ by $1\frac{1}{2}$ inch, which is imbedded in the grooves with white lead.

All joints of the staves and bottoms, and particularly where the bottom enters the gain in the staves, must be fitted with the greatest accuracy, and the surface forming each joint must be covered with white lead just before finally putting them together. Nails or screws must not be used anywhere. Finally, the tanks are covered outside with three coats of white-lead paint, the last being one of a dark color, such as will not show dirt.

If the lumber is perfectly dry, several coats of paint inside will be beneficial. Too much care cannot be used in the putting together of the leaching-tanks, since not only is an absolutely tight tank required, if the ejectors are to be used to accelerate the leaching, but also because the use of the ejectors will greatly augment any defect in the tank. In the construction of storage and precipitating tanks for solution, so much care is not necessary, but will be found advantageous. But the construction of the precipitating-tanks for wash-water requires more care than for any other except the leaching-tank, as the wash-water requires to be heated if the precipitation is by acid and iron. These tanks should be of dry lumber, carefully put together and coated with paint. The dimensions and number of all tanks are given in the drawings, the storage-tanks being of the same dimensions as the precipitating-tanks.

The space under the filter in the leaching-tanks should be as small as possible. The false bottoms for these tanks are prepared as follows: Wooden slats $1\frac{1}{2}$ inches high and 1 inch wide and separated one inch from each other, are fastened to the inside of the bottom of the leaching-tanks by screws imbedded in thick white lead. The side of the slats next to the bottom is cut out, about every 7 or 8 inches, $\frac{1}{2}$ inch deep and 3 inches wide, so that a passage for the solution is established everywhere. Between the end of the slats and the staves a clear space $1\frac{1}{2}$ inches wide is left all round, a strip of wood $1\frac{1}{2}$ inches high and 1 inch wide, previously cut by a saw on one side in many places and well soaked in water so that it will bend easily, is fastened around the slats, leaving an annular space five eighths inch wide between the strip and the staves. One thickness of stiff matting (covering the slats and the circular strip, but not the annular space) forms a foundation for the filter cloth proper.

The latter, No. 8 canvas duck, is cut to a diameter 6 inches greater than the inside of the tank so that the edges can be pressed into the annular space described above, and kept in position by forcing down a one-half-inch rope. The filter does not require to be removed oftener than once in six or eight months.

There is only one outlet to the leaching-tanks, which is in the center. It consists of a threaded cast-iron flange, bolted to the bottom, the bolts passing through the bottom, and together with the heads being imbedded in white lead. The details of these flanges, and the manner of connecting the two hose with them, are given in Figs. 12, 13, and 16 of the details.

There are three storage-tanks, the use of which vary according to circumstance, as follows:

First.—If raw ore is being treated, one of them (H) is always used for the preparation of the extra solution, and the other two (G, G) for heating and storing warm solution, which is always used in treating raw ores. Second.—If roasted ore is being treated and there is ample leaching-tank capacity, the extra is made up on the ore, the storage tank (H) being used for heating and storing warm stock solutions, and the other two (G, G) for cold stock solution, the coils in the bottom of the latter two not being used. Third.—But if the leaching-tanks are to be run to their utmost capacity, the storage-tank (H) is used for the preparation of the extra solution and one of the other two for warm stock solution and one for cold. The bottoms of the storage-tanks are six feet above the tops of the leaching-tanks. The method of heating the solution is by means of a coil consisting of about 100 feet of $1\frac{1}{2}$ -inch lead pipe in each tank, supported on wooden blocks about 4 or 5 inches above the bottom. In regard to the triple connection between the three storage-tanks, in the first and second cases described above, the valves on the two tanks (G, G) are left open all the time, and the valve on (H) shut all the time.

In the third case all the valves are kept closed.

Above the storage-tanks and just under the ends of the pipe which brings the solution up to the storage-tanks from the solution-pump, are boxes about 2½ feet square and one foot high inside, with one-inch holes in the bottom. The boxes over the two tanks (G, G) are for the purpose of breaking the force of the stream of solution as it comes from the pump, which would otherwise disturb the small sediment of sulphides which is still mechanically held in the solution and is gradually deposited on the bot-

tom of the storage-tanks and is removed once every few months.

This sediment, if disturbed, would pass out of the storage-tanks on to the surface of the ore in the leaching-tanks, and any portion of it deposited after the use of the extra solution might be thrown out with the tailings. But this box has for tank (H) an additional use if the extra solution is made up in that tank, as it serves as a chemical-box in which the chemicals for the extra solution are dissolved by the solution passing through it.

At the bottom of each storage-tank around the outlets are small boxes about six inches high, with perforated tops, which act, not only to prevent the solution being drawn down below six inches, thus keeping back sediment, but also keep chips, etc., from getting into the pipes and valves, over the leaching-tanks. But if the storage-tank (H) is used for the preparation of the extra solution, this box must be removed so as not to keep back any cuprous hypsulphite, or yellow precipitate, which may be on the bottom of the tank.

The hoops of all tanks are of round iron, flattened at one end and with a lug forged on the outer side. The other end of the hoop is upset, threaded, passed through a hole drilled in the lug and a nut screwed on the end. The method of passing the hoop by the sluice-gate is shown in detail in Fig. 12.

C.—Precipitating and "Sump" Tanks and Storage-Tank for Sulphides.

The tops of the precipitation-tanks should be about four feet below the inside of the bottom of the leaching-tanks. The number of the precipitating-tanks required will vary according to the following circumstances:

In the treatment of raw ores there is no first wash-water to be precipitated, so that the total number of precipitating-tanks for a raw-ore plant is only three instead of the six shown in the drawings.

In the treatment of roasted ore from which the solution dissolves little or no lead, the number of precipitating-tanks is the same as shown in the drawing.

If lead is to be precipitated, three additional tanks will be required, and should be placed between the tanks for the precipitation of solution and those for the precipitation of wash-water. They may be placed in the same line and on the same level, and the solution forced from them into the tanks for the precipitation of silver and copper, by means of siphon pumps. The details of the surface discharge (d') of the precipitating-tanks are given in detail, Figs. 6 and 7. As to the stirring apparatus, a mechanical stirrer is entirely unnecessary and in the way.

With an ash or of 16 feet length, the total amount of stirring in 12 hours amounts altogether to only one hour by one man. For easy stirring with the ear, the platform around the precipitating-tanks should not be more than six inches below the top of the precipitating-tanks. The "sump" tank (D) for the solution pump has a box and strainer around the outlet, for the same purpose as that described under the head of storage-tanks. The storage-tank (E) for sulphides has no such box. The pipes from the precipitating-tanks should be coated on the outside with asphaltum varnish; particularly is this necessary for the discharge pipes from the wash-water precipitating-tanks.

D.—Tanks for the Preparation and Storage of Sodium Sulphide and Soda-Ash.

The tank, J, for the preparation of sodium sulphide, is of cast iron, in two sections, the lower being $1\frac{1}{2}$ inches thick and the upper three-fourths inch. The two sections are bolted together through flanges and the joints are leaded. On to the bottom is poured 1 to $1\frac{1}{2}$ inches of melted lead. The pipe for live steam reaches to within $1\frac{1}{2}$ inches of this lead plate.

The two tanks, K, J, for the storage of sodium sulphide, are of three-eighths inch boiler iron, and in the drawing are represented with flanges on top, which are not necessary.

It will be noticed that there is a partition forming a small room around the tank for the preparation of sodium sulphide. This is necessary because in breaking up a drum of caustic soda, pieces are likely to fly and get into the storage-tanks holding the leaching solution.

If soda-ash is to be used as a precipitant for lead, the same number and size of tanks should be used as for sodium sulphide, and arranged in the same way, but are all of three-eighths-inch boiler iron.

E.—Pipes, Valves, Launder (or Troughs), Sluice Gates and Chemical-Boxes.

The sizes of all pipes are given in the drawings. The only place where the solution has any material effect on iron pipes is between the outlet of the leaching-tanks and the precipitating-tanks. Therefore rubber hose is used, which seldom requires renewing. Six-ply steam hose is recommended, simply because it is more durable and does not kink or sag, or wear out at the ends if continually plugged. The line α , leading from the center of the leaching-tank to the triple launder, is in one piece. Wooden plugs are used for stopping the end. The hose β , leading from the center of the leaching-tank to the siphon, is the same size as the other, is attached to the flange below the other hose, and must have a gradual slope, without a sag, down to the siphon pump, so that any drop of liquid coming from the leaching-tank will run down into the siphon pump.

The hose leading from the siphon pump up over the leaching-tank is also of the same size and in one piece, and is used in circulating the

extra solution. The end must be movable from one compartment of the double launder to the other. There is also a short piece of hose (e) leading from the siphon pump to the triple launder, necessary only when the siphon pump is used to accelerate the leaching. At other times it is kept plugged.

The ends of both pieces of steam hose lying over the triple launder can be moved from one compartment to another.

The valve in the steam pipe which furnishes steam to the siphon pump should be of Jenkins' pattern, and situated three or four feet above the siphon so that the leaching solution cannot come in contact with it. As described below, the steam for this siphon pump must be dry and therefore the main and branch lines of steam pipe must be covered. The 2½-inch pipes (a' and b') from the launders to the precipitating tanks are also steam hose.

In order to keep any sand or sediment which might get into the launders from passing into the precipitating tanks, nipples or short pieces of 2½-inch pipe are inserted in the outlets of the triple launder and project about one inch above the bottom. The launder (l) and the pipe (z) are for that part of the wash-water which does not require to be precipitated. The trough (or launder) (m), at the back of the precipitating tanks, conducts the sulphides to the storage-tank for sulphides. It has a grade of about 4 feet in 100. The sulphides are run into it from the precipitating tanks by a short pipe attached to a flange bolted on to the precipitating tank just above the bottom, so that all the sulphides can run out.

The valve is a gate valve, something like a molasses or oil gate, and is shown in detail in Figs. 8 to 11 inclusive.

The launder (n, o) in front of the precipitating tanks is horizontal, and has a division opposite a point between the third and fourth precipitating tanks, so that one-half its length is used for conducting solution to the pump sump, and the other half to conduct the precipitated wash-water out of the mill.

One side of the double launder above the leaching tanks has no division, but runs the whole length of the leaching tanks, having a hole over each, which is closed with a wooden plug. This serves for transferring the special extra from one ore charge or tank to another. The other compartment of the launder has a division between each two leaching tanks and conducts solution or water to the chemical box, which has a perforated bottom and serves not only as a receptacle for chemicals, but also to break the force of the stream of solution, so that it does not make a hole in the ore.

The sluice-box or launder conducting the tailings out of the mill should have a slope of one inch to the foot.

The opening should be about 12 inches high by 18 inches long. The hose connections for sluicing are shown at y. The two lines of hose are each 30 feet long, each doing duty for three leaching tanks.

The sluice gate shown in detail in Figs. 12 and 13 is packed with a rubber gasket. The solution pump sets in a low tank about six inches high, which catches any solution that may leak from it, and a pipe conducts it to the sump-tank under the filter press.

The water pipe r is for leaching. There is no occasion for any water pipe to the storage tanks, as no water is there required after once making up the stock solution. On that occasion the water may be obtained by running water into one of the leaching tanks and then down to the solution pump and pumping it up to the storage tanks.

All the valves in the triple connection between the storage tanks are gate valves; also those on the pipe line leading up from the solution pump to the storage tanks and those near the storage tanks on the pipe lines leading from the storage tanks to the leaching tanks, and all those on the sodium-sulphide tanks and pipes; but all those over the leaching tanks are Jenkins' rubber-faced globe valves. The valves between the solution pump and "sump" and between the storage-tank for sulphides and the pressure-tank, and between the pressure-tank and filter press, and on the pipes which convey the sediment from the solution-pump sump and the solution storage tanks, and on the line of water pipe for sluicing tailings, are also gate valves. At every angle in the pipes for conveying sodium-sulphide should be a cross instead of an elbow. A slight sediment of silver sulphide gradually collects in the solution-pump sump and in the solution storage tanks which must be occasionally removed. This is done by means of the pipes a, b' and c'. The valves should be near the tanks. The pipe from the solution-pump sump ends near the bottom of the pressure-tank, and is connected with it by a hose-coupling only when needed; a permanent connection not being advisable, as a leak in the valve might occur without being detected, thus allowing sulphides to be forced back into the solution-pump sump.

(To be Continued.)

The Salt-Beds of South America.

The salt-beds on the west coast of South America, according to the description of Dr. Carl Ochsénius, occur in a narrow strip along the coast line of the rainless district, rarely exceeding 25 miles in width. The district is bounded on the east by the Andes, and extends into the coast Cordilleras on the south. The author considers that, before the upheaval of the Andes, salt began to deposit in certain bays,

which had been wholly or partially shut off from the sea by the gradual formation of an intercepting bar. Then, while the process of evaporation was still incomplete, the district was raised by volcanic action, and the mother-liquors from the salt lakes eventually escaped, running down into the valleys, and, where they encountered no obstacle, reaching the sea. The coast Cordilleras acted as a barrier in the southern portion of the district, while in the northern part the liquors doubtless returned to the sea. The volcanoes which produced the upheaval exhaled immense quantities of carbonic acid gas, by the action of which a portion of the sodium chloride in the mother-liquors was converted into sodium carbonate. The coast in this part of Chili is studded with small islands containing deposits of guano rich in ammonia. The guano dust is carried by the prevailing west winds far into the country, where, on exposure to the air, at a warm temperature, it would gradually oxidize to nitrate, and, acting on the sodium carbonate, would form sodium nitrate, or Chili saltpeter.—*Popular Science Monthly.*

Natural Gas and the Brine Wells of China.

Consul Denby of Peking explains that to make a well (natural gas is found in several Chinese provinces) the Chinese use a long and elastic bamboo pole, supported in the middle by a crosspiece, a rope made by coupling the ends of long pieces of bamboo, and an iron instrument which weighs about 100 catties—the catty being equivalent to one pound and a third avoirdupois. The rope is fastened on the thin end of the pole, and the iron on the end of the rope. A slight up-and-down motion of the thick end of the pole makes the iron move a vertical hole with its broad, sharpened edge. The ground to be bored consists chiefly of sandstone and clay. When a portion of the rock is crushed, clear water is poured into the hole, a long bamboo tube with a hole in the bottom is lowered, and the turbid water raised to the top. Pipes of cypress wood are rammed in to protect the sides of the bored hole, and to prevent the water contained in the surrounding ground from gaining access to the well. The pipes are attached to each other at the ends with nails, hemp and tung oil. The inner width of the pipe is about five inches. As the work proceeds the pipes are rammed down and a new one attached on the top; the rope, too, is made longer. At a depth varying from 70 to 100 chang (from 700 to a thousand feet) the brine is struck and the well is fit for use. The brine is raised to the top through long bamboo tubes and bamboo ropes, and then carried to large pans for evaporation or led to them through bamboo pipes.

Besides these wells, there are others which are bored to a depth of from 1800 to 2000 feet. At that distance below the surface petroleum is struck. Immediately on reaching it an inflammatory gas escapes with great violence; work is now stopped and a wooden cap fastened over the mouth of the pit, perforated by several rows of holes. In each of these a bamboo pipe is inserted, and through these the gas is led into the evaporation pans. The pipes ramify, and on each end a tapering mouthpiece, terminating in a small aperture, is attached; the gas is then used for evaporating the brine.

A Miner Who Made \$12,000,000.

Marysville, nearly 30 miles from Helena, is a second Wickes in appearance, but when one remembers the wealth of the mines which have created the town, he forgets the ugliness of the streets and ceases to notice the dilapidation of the rudely built cabins. Marysville is chiefly famous as the site of the Drumlunnon, but does not depend on this mine alone for its support. The town is in the chief seat of an extremely rich district, already well developed, and is an important suburb of Helena. It is connected by rail with the latter city, and will eventually be the terminus of a branch of the Manitoba road.

The discoverer of the Drumlunnon was Thomas Cruse. In the days before he sold his property and returned to Helena a much-honored millionaire, Mr. Cruse was locally known as "Old Tommy," and was looked upon as a somewhat visionary man. None questioned, after a time, that his mine, where he lived and labored alone, was valuable, but few placed its worth so high as did the patient owner.

When he refused half a million for his mine, the people of Helena called him foolish, and when he turned away from the offer of a million, they called him a fool. But the miner was wiser than his friends, and eventually received its price, \$11,500,000, and a goodly number of shares in the new company. Then, as so often is the case, the old familiarity was stopped, and the "Tommy" of by-gone days became Thomas Cruse, "capitalist." A kind, thoroughly honest man, of whom all who knew him are ready to say a good word, he is a familiar figure on the streets of Helena, and to-day is president of a savings bank in the city where a few years ago he was not sure of getting trusted for enough to keep himself alive. As an illustration of the ups and downs of a miner's life, he is a notable example.—*Harper's Magazine.*

"Old Locomotive."

[Written for the Press.]

Five o'clock! Not much use trying for another nap, since we have breakfast in half an hour, and at six we must be off on our journey over the rough mountain road in the heart of the Sierra Navadas.

The air is fresh, cool and invigorating, as it always is in this delightful region, although the sky is thick with smoke on this particular morning, on account of the numerous forest fires which are burning all around us. As they have not yet approached too near to us, we pay little heed to them, but at night they make a grand and beautiful sight as they glow out upon the surrounding mountains, intensified by the darkness.

Breakfast finished, we complete our preparations for the journey, which is to be made upon no less a conveyance than a steam wagon or road locomotive. Many of these vehicles have been constructed, and are doubtless familiar to many, but this one is unique both in appearance and achievements.

Let me give you an idea of its appearance: Three enormous steel-tired wheels, between 6½ and 7 feet in diameter, support the frame, two at the rear and one at the extremity front, where it is centrally mounted so that it can be turned from side to side to guide the machine, without in any way interfering with its propulsion and operation. Upon each side, over the rear wheels, two immense cylinders are fixed at an inclination, so that their connecting-rods take hold of the crank-pins of two cranks upon the ends of the shaft of the front wheel, and side rods connect these cranks with other cranks upon the rear wheels.

Behind the boiler is a broad, low cab in which the fireman takes his place, while the engineer is installed in a lofty open-fronted pilot-house in front of the boiler, and just over and behind the big front wheel. Here are the throttle-valve lever, the reverse lever and the steering-wheel, all within easy reach and under instant control. Here also the invited guest may take his place at an elevation which lifts him comparatively above the clouds of light dust which arise from a road subjected to the wear of constant heavy travel during a long rainless summer, and in a position to oversee the road in front, the engine beneath, and the long train of heavy lumber wagons which are coupled on behind the engine.

Everything being in readiness, the monster starts with slow and labored breathing up the side of the mountain, over the dry beds of winter torrents upon bridges, which, although made enormously strong for the purpose, still excite distrust upon the first passage.

Winding up the sides of the mountain, over roads so rough that it seems as if the ponderous machinery must be broken or disorganized at each jolt (and you know that your own is receiving shocks which paralyze you), it seems impossible that such an apparatus can climb such steep grades. Yet upward it goes, steadily and without hesitation, breathing harder as the grade grows steeper, until the summit is reached.

The sun now begins to reach us for the first time, and the forest fires are now very near to us. How grandly they sweep along, devouring the underbrush and smaller trees as they are reached. Now they have surrounded an enormous cedar, whose dense green foliage seems capable of resisting all their attacks.

The fire appears to have burned out around the base of the tree, and to be passing on, when suddenly, with a roar which can be heard for a mile, a column of flame springs upward like an immense crimson sheet, and in an instant envelops and shrouds the whole height of the tree, and shooting a hundred feet above its topmost branch, is gone in a flash and in less time than it takes to tell it.

Look again, and in place of the tree with its robe of vivid green, there stands a dead and naked trunk, with bare arms standing stiffly out from its sides from base to crest.

Now the fire approaches dangerously near to the snow sheds of the Central Pacific, which winds its tortuous way along the distant ridges upon the opposite side of the deep canyon separating it from us, and anon the fire patrol of the sheds, the water train, comes shrieking through the sheds with lightning speed. It stops, a coil of hose rolls down the steep embankment, and in a marvelously short time a stream from the powerful pumps of the engines is hissing in the flames, upon which for a time it seems to have but little effect. The fire creeps slowly toward a high trestle, and they redouble their efforts. We can plainly hear their shouts, as we turn a sharp curve and pass over the brow of the hill and commence the descent into another deep canyon which we must cross, to climb another mountain before we reach the mill where we are to leave our empty wagons and take a full train loaded with lumber.

At intervals we stop at little wayside tanks to replenish our water supply, and at the same time to take on some wood, which, being plenty here, serves for fuel.

Sparkling springs, cold as ice and clear as crystal, break from the mountain-side and invite a stoppage which is often made.

Arrived at our destination, we leave our empty train and couple on to a load which it seems literally impossible for the machine to haul over the road we have just passed. Notwithstanding it has been a semi-daily task for more than

a year past, I could not help feeling that for once there was a load which must bring us to a standstill. But no; the giant machines started with its load and steadily onward and upward it dragged those loaded wagons, with no other signs than the heavier breathing of the exhaust.

Grades of one in twelve, one in nine, and in one case for a short distance one in five and a half, were overcome with apparent ease, and in many cases around curves at the same time, which left the rear of our train entirely out of sight.

Just as we were passing a sawmill-yard, a man appeared running around a sharp turn in the road ahead, frantically waving his hands for us to stop. This we did upon a sharp grade, and soon two enormous log trucks appeared coming down the hill and turned into the road just in front of us leading to the yard. Ten yoke of big oxen to each truck coming downhill, and yet all of them could not have pulled our load up the hill we were now commencing to ascend.

As soon as the trucks were out of the way, we again started, our giant moving the load on the sharp grade where we had stopped, apparently as easily as on a level.

And now for two miles steadily onward and upward does the engine drag that heavily loaded train, with not a stop or falter over rough corduroy bridges and rocky roads which give the severest shocks; but although I watched closely I could detect not the slightest tendency to slip, even upon the worst part of the road.

Grades were overcome with a load of 25,000 feet of lumber, which the best locomotive upon a track could not pull itself over. Three wheels with 14-inch face, steel tires and no especial roughening except the rivet-heads of the tires, furnish a traction sufficient to pull the strongest locomotive backward upon a level. This engine has hauled a load of 130 bales of hay over the road above described, including one short rise of three feet in sixteen and a half.

Upon the ordinary country roads of the valley, such a machine would be invaluable as a feeder for a main line of any description, as it could certainly make daily trips out and back of 26 miles each way, hauling loads proportioned to the character of the road. None that I have seen are nearly so hard as the one where the machine has worked for more than a year without break-down or accident.

Two trips a day are made to the mills 6½ miles distant, and six wagons carrying from 20,000 to 25,000 feet, form a load, which in round numbers makes nearly 50 tons, besides the weight of the engine itself.

A million feet of lumber per month is easily hauled, this being the record for July over the above-described road, and it is said that more could be hauled if it were ready.

It is certain that the return trip could be made equally profitable in localities where a load could be had each way, and in agricultural sections the machine could be utilized to haul gangs of plows at the proper season, and to haul grain and merchandise upon the roads. The broad wheels acting as rollers would improve most roads over which they would pass.

The machine is easily handled, turning around and backing as easily as an ordinary wagon.

Corporation Wrecking.

Railroad wreckers were roughly handled in a decision rendered in Chicago last week, by Judge Tuley in the case of the Smith Bridge Co. vs. Henry Crawford. The plaintiffs claimed that in 1882 they constructed two bridges over the Wabash river for the Chicago & Great Southern railroad, under contract for \$21,000; that Mr. Crawford, who undertook to build the road, did so under a construction contract, having claimed that he had no interest in the company, whereas, in fact, he owned \$2,400,000 of the stock. It was further claimed that this construction contract was made through a dummy board of directors, the contract being made to himself; that as soon as the contract was completed, he caused a mortgage he held on the railroad to be foreclosed, and a receiver for the entire assets appointed. The old company being thus burst up, a new company was created. In this way every creditor of the old company, including the complainants in the present suit, were left without any means of satisfying their claims. "The time has come," said the Judge, "when the courts must rise equal to the emergency that is now upon them, equal to the changed conditions and methods of transacting the affairs of corporations, and hold that the manipulators of corporations do not lose their identity because they hide behind corporate forms and proceedings. Trusts, heretofore unknown to the law, are formed to manipulate corporations, by which the people are oppressed and the powers of the State defied. Corporation wrecking has become an established practice, and parties even use the forms of a Court of Equity for that purpose. Advanced ground must be taken, and these manipulators of corporations, whether 'trustees' or 'wreckers,' must be held personally accountable for corporate assets which get into their possession, and for all profits made by their manipulations in their private interests of corporate property or corporate franchises. The courts must in such cases apply the rule which Courts of Equity apply in all other transactions, and deal with the real party, the moving party, the real actor, and will grasp the substance without regard to the obscuring forms under which it may be hidden."

Passing Events.

During the past week more phenomenal weather in California. Beginning on Sunday, and continuing for two days, much thunder and lightning with heavy showers, the latter extending over most of the State. With this electrical display there will be need for amending the meteorological record of California, the lightning for the first time in the history of the State having been attended with fatal results, two or three deaths from this cause being reported. A Chinaman is said to have been killed here many years ago by an electrical stroke, but the cause not being well authenticated, these recent disasters may be regarded as the first of the kind occurring in the State.

As the day of the great quadrennial election approaches, the situation becomes exciting and partisan feeling intensified. All is noise and turmoil, the great political whirlpool drawing in the local float, and so engulfing it that it will be some time before it again comes to the surface.

From all parts of the mineral domain reports continue favorable, indicating a generally progressive condition of things, and at least an average production of millions for the current year.

Mineral Zones and Mountains.

A glance at a map or orographic chart of this coast shows, aside from the great mountain chain, a general parallelism of ranges and ridges, with a prevailing northwest trend. The materials of this immense mountain area are infinitely varied, ranging from the earliest to the most recent deposits, and embracing almost all known spaces of sedimentary and eruptive products. Clarence King's Exploration of the 40th Parallel demonstrated that all the parallel ranges of the Great Basin, including the chain of the Wahsatch (its Eastern wall) belong to the same system of upheaval, and that while the Pacific built upon the western base of the Sierras those fringing deposits of sand and clay, which thickened through the undisturbed period of the cretaceous and a wide range of the tertiary, the Atlantic, or, more exactly, the ocean which covered the Mississippi basin, heaped upon the east flank of the Wahsatch and laid down a series of cretaceous and tertiary strata, exactly corresponding with the coast deposits of the Pacific. At length, after accumulating to an extraordinary thickness, these outlying and later shore-heds were themselves folded into mountains parallel and astride of the earlier system.

One of the plates accompanying King's Exploration of the 40th Parallel is a section of the Warren map of the U. S. Engineer Department. This section given includes the main central region of the Great Basin, with a part of the coast system of California, and the outlying chains of the Rocky mountains. A brief study of this map will teach the one great and prominent law of arrangement of Cordillera mountain chains, namely, that they trend from north to south, or northwest to southeast; in other words, longitudinally with the main axis of the whole system of elevation. In strict subordination to this longitudinal direction of ranges, says King, are grouped all the structural features of local geology. The average strike of the great areas of upturned strata is generally with the meridian. All the larger outbursts of granitic rocks conform to it as well, since their rents are most commonly the axial lines of actual folds; and, lastly, when the tertiary uplift occurred, its ranges bordered the older mountains in parallelism, and the volumes of lavas accompanying it found exit through longitudinal rents, and either built themselves up along the ancient lines of structure or through new fissures, piled up chains of volcanoes conforming in trend with the general north and south plan.

Over these adobe mountains are found localities of the precious metals, and it is not surprising to observe that, following its leading structural idea, they appear to arrange themselves in parallel longitudinal zones.

This zonal parallelism was first indicated by Prof. Wm. P. Blake in a note in his "Catalogue of California Minerals." It is obviously true, as he has indicated, and King thinks that it is probable that the idea could be carried much further than he has done. The Pacific Coast ranges, upon the west, carry quicksilver, tin and chromic iron. The next belt is that of the Sierra Nevada and Oregon Cascades, which, upon their west slope, bear two zones, a foothill chain of copper mines, and a middle line of gold deposits. These gold veins and the resultant placer mines extend far into British Columbia and Alaska.

Lying to the east of this zone along the east base of the Sierras and stretching southward into Mexico, is a chain of silver mines, containing comparatively little base metal and frequently included in volcanic rocks.

Through Middle Mexico, Arizona, Middle Nevada and Central Idaho, is another line of silver mines, mineralized with complicated association of the base metals, and more often occurring in older rocks. Through New Mexico, Utah and Western Montana lies another zone of argentiferous galena lodes. To the east again the New Mexico, Wyoming and Montana gold belt is an extremely well defined and continuous chain of deposits.

COAL IN INDIA.—There is very little reason to doubt the prediction of Sir W. W. Hunter and others that India will some day become a large coal producer. There are now 105 collieries open in India, 69 of which produced 1,388,407 tons in 1886. The imports of coal during the same year were 848,878 tons. The

Bombay mills use imported coal entirely, there being no coal mines at present in Western India. The native coal is used chiefly on the railways. Nearly all the existing collieries are situated in the Bengal presidency, but there are two in the Central Provinces and three in Assam. It should be stated that no account is taken in the above statistics of coal-mining in any of the native States.

Mining and our Mineral Resources.

From being one of the most exciting and hazardous the business of mining for the precious metals has become one of the most staid and certain of all our leading industries. In no pursuit, not even farming, are the results better assured than in this. Even in the speculative branch of the business there is, at the present time, less money being lost than in transactions of this kind that have to deal with agricultural or manufacturing products. In the attempts to corner the wheat market last year, there was more money sunk in this country alone than in mining gambles the world over. As compared with operations in oil, coal and railroad shares, even the largest deals in mining stocks seem tame and insignificant.

Not only so, but the unhealthy excitements of former days, with their rushes and ruin, have almost died out. The big strike and the far-off discovery are now but feebly responded to by even the most sanguine and restless. While their announcement quickens a little the pulse of the old-time prospector, it fails to start him off on the long and weary tramp in which he once found such delectation. Though it may sadden the hearts of these veterans, so often the victims of the wild stampede, this change is all in the interest of legitimate and well-ordered mining, which, as the experiences of these later days show, is all the better for such absence of flurry and excitement. As all things else may be pardoned the indiscretions of youth, so may mining be excused some of the follies committed during its juvenile stages, which follies, he it observed, have hardly been greater than those incident to many older and long-established industries.

But mining needs no apology. Its record is its own sufficient vindication. It has established by a hullion output of two and a half billions its right to be classed among the great productive industries of the land. Among all our material interests there are but few that could be sacrificed with less detriment to the common weal of our own country or the cause of civilization than this.

There is reason to believe that the extent of our mineral resources is not fully comprehended, nor the importance of mining properly appreciated by the people at large. Few seem to understand that we have within the limits of the Republic over two million square miles of metalliferous territory, hardly more than half of which has yet been thoroughly explored. To say nothing of Alaska, practically an unknown land, we have thousands of square miles nearer home that have merely been run over in the way of prospecting. Even here in California hundreds of known gold-bearing ledges remain undeveloped, to say nothing of the still greater number that more thorough research will hereafter no doubt bring to light.

We have now in our acquired knowledge of the business what constitutes a sound basis for the prosecution of gold mining in a safe, intelligent and profitable manner. We have also the mines that make this an especially inviting field for the investment of capital. We do not say this with a view to disparaging the resources or advantages of our neighbors. But California being an older mining country, naturally possesses greater facilities for engaging in and carrying on the business than her juniors. In the matter of transportation, the construction of machinery, climate, wood and water supply, and various other particulars, we may justly claim for this State some preference in a mining point of view. The mild winters that prevail throughout most of the mining districts of California alone insure to her great advantages over more elevated regions and northern countries.

As for Alaska, however great her mineral wealth, exploration and development will have to be carried on there subject to many drawbacks. But then there is no hurry about that country; its resources, like the north pole, will keep.

Samples and Results.

Not long since an old subscriber of the PRESS sent some ore to this city to be sampled and assayed, not being satisfied with the results he had obtained at local establishments where he was working his mine. He professed to have been careful to select an average of his ore, though the result showed that, as is commonly the case, a better class of ore had been sent than the general run of the vein. Of course the assayer here could only work on samples from the few sacks sent to him. On the basis of these assays, however, our friend sent a quantity of his ore to a custom-mill and was again disappointed.

In judging of the comparative efficiency of various mills or methods by the results obtained on a large scale, it is important to remember that the assay, which is the only standard to which the results are referred, is not infallible.

Notwithstanding all the care exercised by parties interested, even when a great number of samples are selected for assay, the result after all is only an approximation of the truth. Some portions of a given particle of ore may contain free gold or segregated particles of rich silver ore, which quite escape due representation in the samplings, or the contrary may occur, and the value of the particle be overestimated. Further, the variable amount of moisture on the ore affects the result, since the assay is of the dried sample.

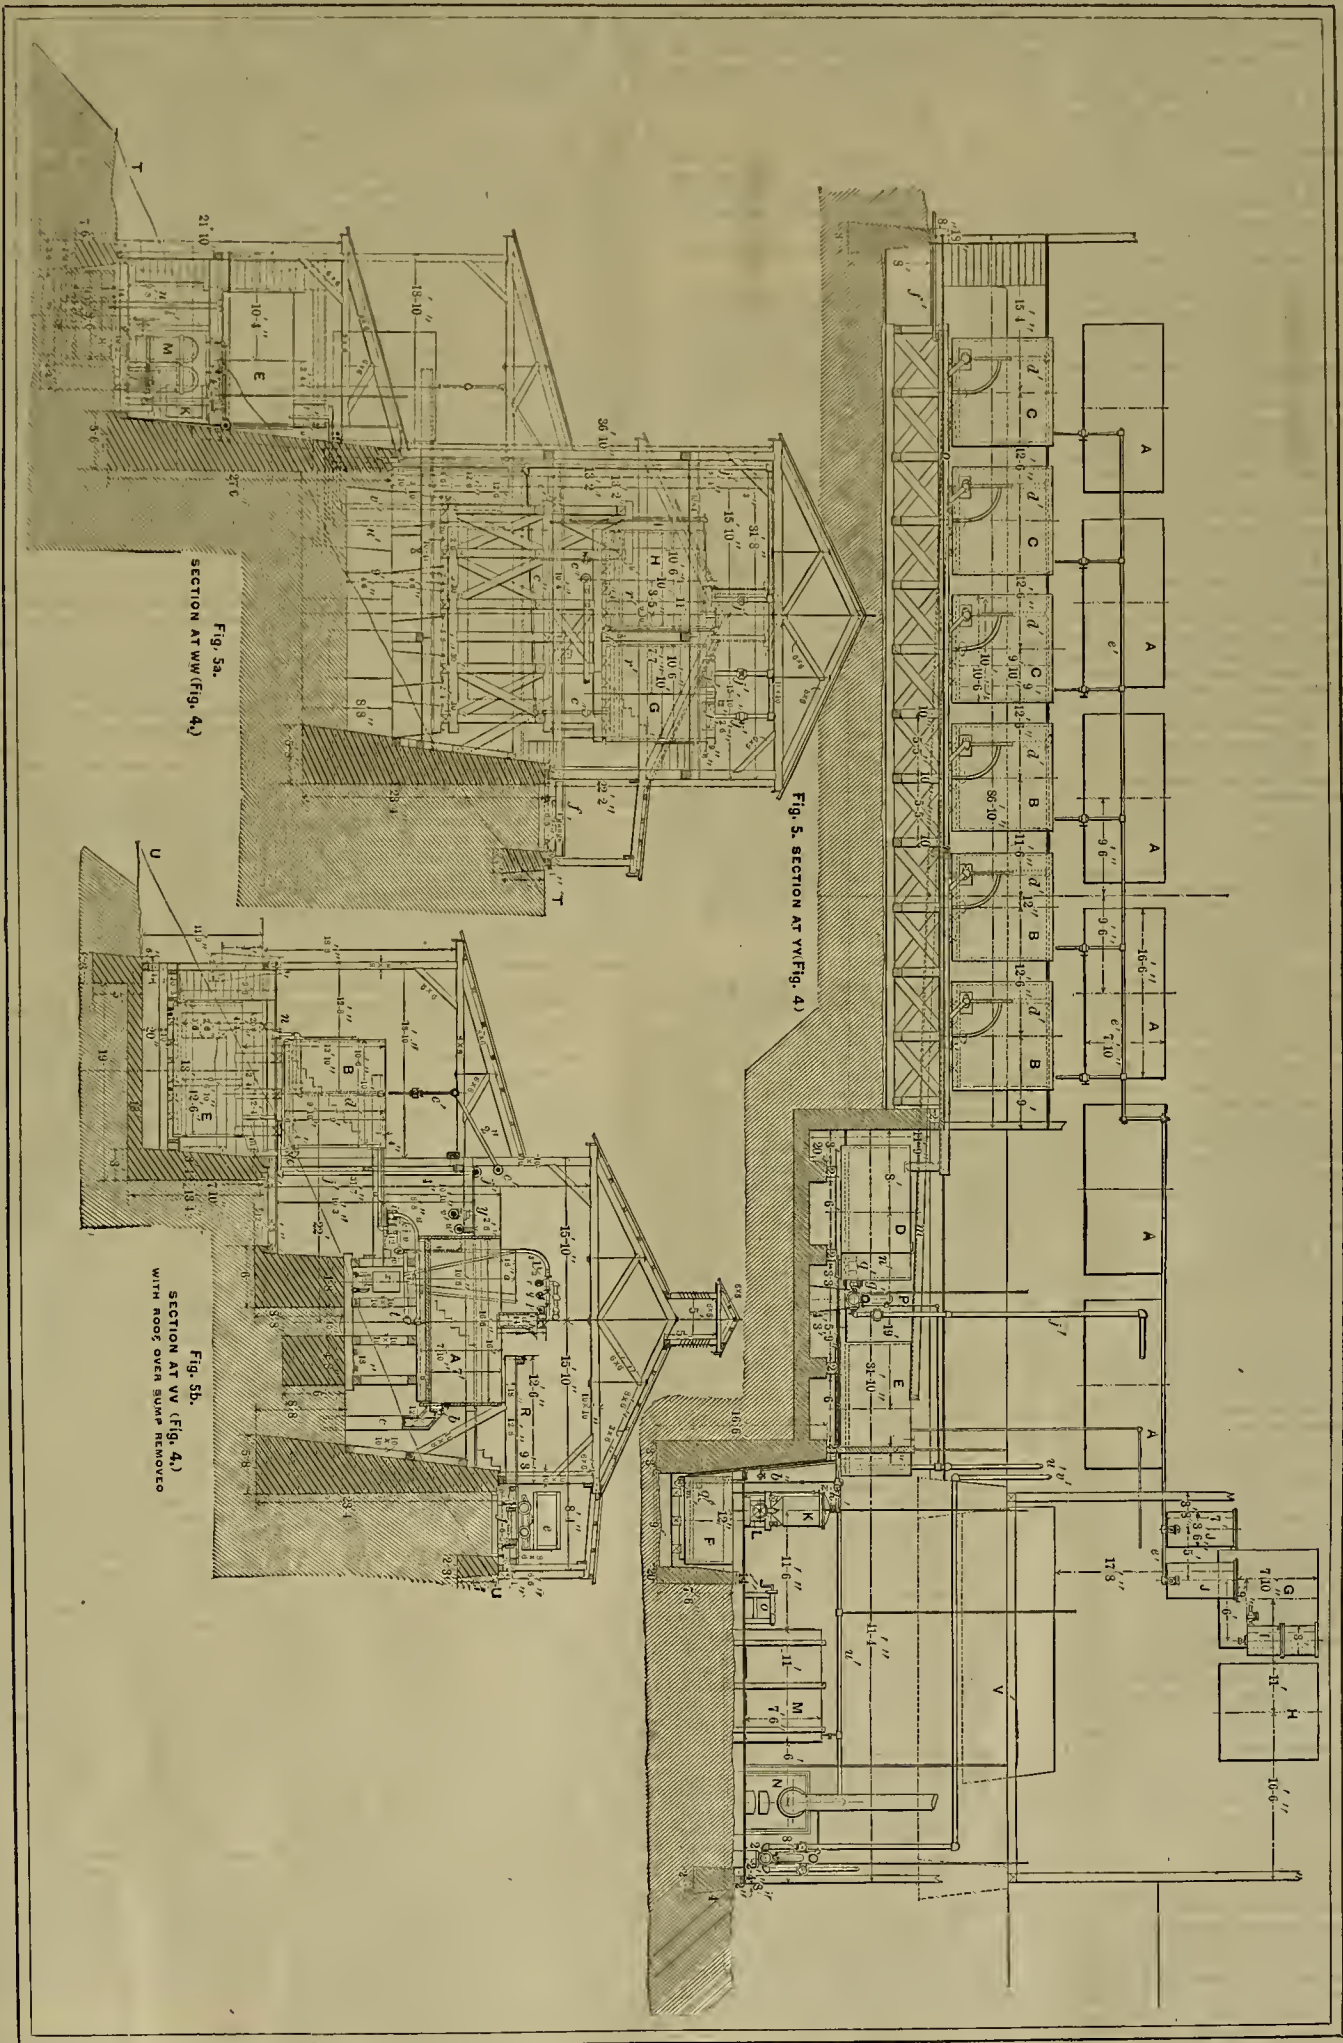

Finally, some ores produce in crushing very variable quantities of slime, on account, partly, of the character of the gangue, some being more clayey than others, and partly by reason of the varying conditions present in the batteries, the weight and speed of the stamps, the size of the screen, etc., affecting the proportion of slime carried. These slimes carry with them a certain percentage of the value of the ore, and the relative amount of slimes and coarser sand produced in the crushing of any given pound of ore becomes an important element in the consideration of the results obtained, whether the former pass out of the mill without treatment or whether they are mixed with the sand and worked in pans, especially if, as seems to be the case, the finely divided condition of the particles composing the slimes is unfavorable to amalgamation.

The Russell Leaching Plant.

In the PRESS of August 25th we gave engravings of part of the plant of the Russell process, showing plan and section. We herewith present other cuts showing other sections of the plant, suitably lettered. Corresponding letters refer to corresponding parts in these and the cuts previously given, and we reproduce as follows the index to parts of plant:

A. Leaching-tanks; B. Solution-precipitating tank; C. Wash-water; D. Solution pump sump; E. Storage-tank for sulphides; F. Filter press sump; G. Storage-tanks for solution; H. Storage-tank for hot solution, or for preparation of extra; I. Cast-iron tank for preparation of sodium sulphide; J. Sheet-iron tank for storing sodium sulphide; K. Iron pressure-tank; L. Filter press for sulphides; M. Steam-drier for sulphides; N. Boiler; O. Fire pump for sluicing; P. Solution pump; Q. Main ore track to leaching-tanks; R. Side tracks to leaching-tanks; S. Side tracks in chemical-room; T. Grade line between boiler and steam-drier; U. Grade line through sulphide storage-tanks; a. Tailings chute (to cars); b. Sluice gate for tailings; c. Sluice trough for tailings; d. Box for chemicals for extra solution; e. Ore car; f. Ore-car truck; g. Chemical car; h. Special extra trough over leaching-tanks; i. Solution trough over leaching-tanks; j. Solution trough to solution precipitating-tanks; k. Wash-water trough to wash-water precipitating-tanks; l. Waste-water trough; m. Trough to conduct sulphides to sulphide storage-tank; n. Trough to conduct solution to solution pump sump; o. Waste wash-water trough; p. Solution pipe to leaching-tanks; q. Hot-solution or extra-tube pipe to leaching-tanks; r. Water pipe to leaching-tanks; s. Hose for circulating extra; t. Hose from leaching-tank to siphon pump; u. Hose from leaching-tank to triple launder; v. Hose from siphon pump to triple launder; w. Siphon pump; x. Tailing car; y. Hose connections for sluicing; z. Waste-water pipe from triple launder; aa. Solution precipitating-tanks; bb. Pipes from triple launder to wash-water precipitating-tanks; cc. Valve or "gate" for sulphides; dd. Surface discharge for precipitating-tanks; ee. Sodium sulphide pipe; ff. Pipe for precipitated wash-water; gg. Connection between solution pump and sump; hh. Box and strainer around outlet; ii. Drip pipe from solution pump; jj. Pipe from pump to storage-tanks; kk. Connection between sulphide storage-tank and pressure-tank; ll. Connection between pressure tank and press; mm. Siphon pump in filter press sump; nn. Solution pipe to sodium sulphide storage-tanks; oo. Pipe for drawing off sediment from pump sump; pp. Pipe for returning solution to solution pump; qq. Small windlass for steam drier; rr. Boxes over storage-tanks to prevent agitation of the solution; ss. Boxes and strainers around outlets; tt. Lead heating coils in storage-tanks; uu. Drip from lead coils; vv. Triple connection between the three storage-tanks; ww. Main steam pipe; xx. Water pipe from fire pump for sluicing; yy. Storage room for caustic soda and sulphur; zz. Storage room for bluestone and hypsulphite; aaa. Trapdoor to filter press sump; bbb. Gauge valve on side of pressure-tank; ccc. Pipe for drawing off sediment from solution storage-tanks; ddd. Siphon pump for circulating solution through chemical-box in extra solution-tank.

"ROAD LOCOMOTIVE" should be the title of an interesting article on page 191 of this issue.

DETAILS OF COMPLETE PLANT FOR THE RUSSELL PROCESS.—See opposite page.

MECHANICAL PROGRESS.

Tempering Springs by Electricity.

There seems to be no end to the application of electricity in the arts. Its application for welding promises to be one of its most useful and notable purposes. One of the latest advances in this direction we find in a late number of the *Industrial World*, which reads as follows:

The subject of tempering spring wire and ribbon by the introduction of a current of electricity as an agency for raising the temperature of the metal to the required heat, has been engrossing the attention of several Chicago gentlemen who have interested themselves in the experiments of Mr. Frederick Sedgwick of this city, the inventor of the process. While Mr. Sedgwick's work has thus far been more especially confined to the tempering of watch main-springs, he has carried out the plan of putting the finest kind of fire temper into round wire, which can be used to great advantage in numerous articles of which more will be said hereafter.

The process by which the inventor tempers steel for watch-springs is very simple and inexpensive. In the first place, he is enabled to temper the steel in continuous lengths of any number of feet or yards, instead of cutting it up into the proper length for one watch-spring, and treating each separately. The greatest difficulty met with in tempering a fine piece of steel, such as that for a watch-spring, by any other process, is the oxidation of the surface of the metal by contact of the heated surface with the air, and also the buckling or twisting of the ribbon on being plunged into the oil-bath. Both of these troublesome points are effectually eliminated by Mr. Sedgwick's process. It is an important achievement, for where the surface of the spring is oxidized in the old method by the heated air in the furnace, as it always is, it has to be rubbed, dressed down, and polished, piece by piece, with emery, until a smooth surface and uniform gauge are obtained; and where the strip of metal is twisted, it has to be straightened out by hand before the temper can be drawn. So much for the old process.

In the new method the soft steel is wound, like a long, narrow ribbon, on a large spool as it comes from the splitting rolls. The ribbon then passes through a set of very fine but powerful rolls which give it a perfectly even gauge of the desired thickness of the finished spring. The soft steel is again spooled, and is ready for the hardening process. From the spool the ribbon passes a point of contact of an electric current from a dynamo, the ribbon itself there forming a circuit by extending to a second point of contact. Midway between the two points, and at the place where the ribbon has received the greatest heat (it being raised to a bright red), it passes into and through an oil bath. The second point of contact is in the further end of the bath, so that a greater portion of the current is taken up in the oil. There is a simple device in the bath for preventing the metal from twisting and kinking, and which also effectually eliminates all oil-bubbles which would otherwise form on the surface of the steel, and thus make it rough. The ribbon, it should be understood, passes through the apparatus continuously at the rate of several yards a minute, and when it emerges from the oil bath it possesses a perfectly uniform temper of great hardness. The fine polished surface given the ribbon by the finishing rolls is not in the least destroyed, and all that is required is to remove the burned oil by the buffing machine, and smooth the edges by an automatic grinder. The temper is then drawn to the required degree and color by a current of electricity, and at this point the temper is automatically gauged. It is then ready to be cut into suitable lengths, and coiled ready for market.

For coil springs such as are used in the magazines of repeating firearms, and light coils of almost any other kind where a reliable spring must be had, the Bessemer electric tempered wire can be advantageously employed, as it can be "hot set." Mr. Sedgwick has a device for giving the wire its proper temper while in the coil. A spring thus made has a much longer life than any other spring coiled in a cold state. Very superior crinoline wire and piano strings can also be thus made. By a slight change in the application of the principles Mr. Sedgwick has successfully case-hardened common soft iron wire. Experiments showed that with Nos. 8 and 9 wire the case-hardening extended through one-third the thickness of the wire. But the remarkable feature of this was that while the surface became so hard that it could scarcely be touched with a file, the wire itself retained its pliability to a wonderful degree. This wire would enter very successfully into the manufacture of wire cable and rope of all kinds.

A COMPOUND ENOINE WITH A SINGLE CYLINDER.—The great advantages of the compound system have long been established, but the necessity of having two cylinders makes a compound engine costly. An engine has been placed upon the market in England, which, it is claimed, combines the economy of the compound system with the cheapness of the single-cylinder engine. This engine has only one cylinder, but the area of the piston in the lower side is reduced to one-third of the full area by means of a trunk. Steam is first admitted into the lower or high-pressure end of the cylinder, and is out off at from half to three-quarter stroke. The steam thus partially expanded in

the high-pressure end of the cylinder is admitted at the completion of the stroke into the other or low-pressure end, when it is expanded to the full extent. The arrangement of valve and ports is stated to be extremely simple and effective, and the diagrams which the engine gives excellent. The advantages claimed for this engine are that it has fewer parts than any other compound engine, and that it can therefore be manufactured at a lower price. The makers are selling them at the same price as an ordinary non-compound engine of the power.

Working Steel.

A thousand useless notions hamper the steel-worker. He is bound down by "processes and personal secrets." He tries to make each two kinds of steel he uses work alike, and he fails. Early training with a certain kind of steel is carried along to hurt his work when some other steel is used.

A certain man may have good success in steel-working. His ways are sought by other men, and used, whether fit for other work or not. There is too little judgment used, and too much "do-so-because-you-do" business followed.

Tempering a solid reamer and tempering a shell reamer are two different matters. The man who attempts both alike fails. That is the result—sure.

Most persistent study and practice is necessary to make a good steel-worker, and then, the experience must be combined with natural adaptability for the work.

There are certain properties possessed by steel which are not comprehended, much less understood, by a majority of steel-workers. Among these properties is the quality of steel becoming capable of staying in place after being hardened by heating to 250° or 275° F.

This property of hardened steel was demonstrated to the writer by Mr. T. K. Almond, the "Almond chuck man" of New York. Mr. Almond has occasion to use from 50,000 to 75,000 pieces of steel, all hardened and made to gauge. These pieces are required to be free from spring in hardening, or, in other words, the molecular tension must be removed, so the pieces will stay forever in the form desired.

It has been demonstrated that if a piece of steel, especially hardened steel, be ground to exact shape, and left to itself for some weeks, the form is slightly changed when examined at the end of that length of time. In other words, the internal tension caused by hardening and forging has changed the shape of the steel in its efforts to free itself, so to speak, from the cramped positions occupied by the steel molecules.

According to Mr. Almond's theory, it is only necessary to force the hardened steel into the desired position, hold it there, and heat to 250° or 275°. The metal may then be allowed to cool gradually, or be plunged into the water-bath. In either case, when cool, the steel will occupy the desired position.

As a peculiarity of this method, the hardened steel shape may be forced by a plunger, driven by hammer blows, into a nicely finished cast-iron die or form. Power enough may be used in driving a two-ounce piece of hardened steel into a die to drive a six-inch spike into a pine log, yet after heating to 275°, and the subsequent cooling, the steel object may be removed with the fingers.

The principle of a relaxation of molecular strains by low temperature has been applied by Mr. Almond with good success in straightening fluted reamers, taps and drills. A press is used to put pressure upon the high side of the steel tool. A Bunsen burner or other hot flame is brought into action, and made to affect the tool opposite the pressure.

The desired straightening can be effected to a nicety and certainty unknown by any other method.—*Manufacturers' Gazette*.

ROLLING OUT CHAINS OF WROUGHT IRON.—The process, some time since announced, of rolling out chains of wrought iron from the solid bar, has, with certain improvements, been successfully resorted to—the principle of forming the rollers and the process of rolling out a chain being, in this case, similar in some respects to the method employed for casting the links and having them come out together in a chain from a mold. In the latter operation, the flask is made to part equally in four ways, and the chain molded while the links are separated so as to divide the spaces equally between them, giving as little clearance as possible, which will not change their appearance perceptibly—the flask is divided, the chain is moved, and one is cast in the mold. Similarly, a piece of chain is swaged out of a bar of iron in an analogous manner, by means of four converging dies. Thus, in producing a continuous chain in this way, the dies are made continuous by having them formed on the circumference of four rollers, arranged with dies distributed in equal divisions, and the rollers driven by gear wheels, so that the four parts of a link will meet accurately in place; proper clearance is given to the dies, so as to allow the material to leave the matrix freely as the roller revolves. As the blank is carried forward between the rollers, the dies partially press or swedge out the links at right angles to each other, breaking the fin or feather edge that is left on the inside of the link.

WHAT may be of great value in ship-building and watch-making is the discovery that steel mixed with 24 per cent of manganese becomes non-magnetic.

SCIENTIFIC PROGRESS.

The New Sugar Substitute.

Our readers will remember our occasional references, during the past few years, to the remarkable substance discovered by Fahlberg, and by him termed "saccharine," from the fact that it possessed the property of sweetness to an extraordinary degree. The discovery was announced some four or five years ago, and since then the discoverer has been diligently at work striving to reduce the cost of its production, in order to make it commercially useful for the many applications in the arts for which its very remarkable properties appear to make it suitable. In this effort he has, from all accounts, already been measurably successful, and a factory for the production of saccharine on the large scale has for some time been in operation.

To what extent this singular compound will ultimately be used to replace sugar, it would be hazardous to venture a prediction; but, from the fact that extended experiments with it have shown that it is quite harmless in its effects when taken internally in articles of food and drink, there appears to be nothing in the way of its use upon the largest scale, save its cost. Upon this point we may add that, to insure its successful adoption as a sugar substitute, it will not be necessary that it should be produced at the cost of sugar, since its sweetening power is so much more intense—several hundred times as great—that one pound of the substitute will effect the same amount of sweetening as many times its weight of sugar.

It should be remembered, however, that saccharine has no nutritive properties, and for this reason can never take the place of sugar as a food, even should it become possible to produce it as cheaply as the latter; nevertheless, there is good reason for the hope that it may prove of the greatest value to those who are afflicted with certain forms of kidney disease (diabetes), in which the use of sugar must be strictly prohibited.

MODERN MAGIC AS APPLIED TO COAL.—Though pit-coal has been known for some hundreds of years, the discovery of its numberless products is confined to the present century. Illuminating gas was unknown 100 years ago. Petroleum has been in use only about 40 years, and it is scarcely more than 50 since some one discovered that stone-coal was inflammable. Nearly all the other products derived from soft coal have been discovered and applied in the interests of science or of fraud within the last 25 years. The first thought in regard to coal is that it is made to give heat or warmth; the next, that one of its principal uses is to illuminate. But there are obtained from it the means of producing over 400 shades of colors, among the chief of which are saffron, violet-blue and indigo. There is also obtained a great variety of perfumes—cinnamon, bitter almonds, queen of the meadows, clove, wintergreen, anise, camphor, thymol (a new French odor), vanilla, and heliotropine. Some of these are used for flavoring. Among the explosive agents whose discovery has been caused by the war spirit of the last few years in Europe are two called dinitrobenzene or helite, and picrates. To medicine coal has given naphthalene, salicylic acid, naphthol, phenol and antipyrine. Benzene and naphthalene are powerful insecticides. There have been found in it ammoniacal salts, useful as fertilizers, tannin, saccharine (a substitute for sugar), the flavor of currants, raspberry and pepper, pyrogallol acid, and hydroquinone, used in photography, and various substances familiar or unfamiliar, such as tar, resin, asphaltum, lubricating oils, varnish, and the bitter taste of beer. By means of some of these we can have wine without the use of the grape, beer without malt, preserves without either fruit or sugar, perfumes without flowers, and coloring matters without the vegetable or animal substances from which they have been hitherto chiefly derived.

THE SUEZ CANAL AND ATMOSPHERIC CHANGES.—The Suez canal is the cause of atmospheric changes which may have an effect of great importance in shaping the destiny of Egypt. Rains are now falling in Cairo and along the delta of the Nile, before almost unheard of. Dr. Chas. S. Robinson of this city notices the arrival of "new forces of disruption from without," and climatic changes most unexpected and peculiar, so that even the mummies, so long preserved in their dry cerements, are now liable to perish from the presence of moisture, before unknown, which percolates through their rocky covering. He says: "Whereas at least until 1878 such a thing as rain was entirely unknown in Cairo, there is nowadays one perpetual and almost tropical downpour, commencing in November and lasting until March," which accounts for the prevalence of typhoid and other forms of malarial fever. And, as might be expected, the manner of constructing dwellings and the mode of life are undergoing a radical change. Roofs must now be made water-tight, and "fire-places and stoves have already made their appearance," instead of the old-time open braziers. The prospect of a new market for stoves, so near the equator, and from causes so remarkable, will scarcely escape the attention of American manufacturers. The fact that there is at this time a most unprecedented season of low water in the Nile, actually threatening a famine from the

lack of overflow, does not militate at all with the above, from the fact that the Nile overflows are due to the rainfall in the mountains of Central Africa. No possible amount of rain in Lower Egypt could cause an overflow of the Nile; but it might obviate the agricultural necessity for the same.—*Ex.*

A HATFUL OF COTTON IN A GLASSFUL OF ALCOHOL.—To all matter must be attributed two essential qualities; first, that in virtue of which it occupies space and which is known as extension, and, second, that which allows only one particle or atom of matter to occupy a given space—the property known as impenetrability. That matter occupies space is appreciated by our senses, and needs no particular proof, but that two portions of matter can occupy the same space at the same time sometimes seems anomalous, as is shown by the following experiments recently described and illustrated in *Scientific American*. Into a tumbler filled with alcohol may be crowded a hatful of loose cotton without causing the alcohol to overflow. The success of the experiment depends upon the slow introduction of the cotton, allowing the alcohol to invest the fibers by capillarity, before they are fairly plunged beneath the surface of the alcohol. In this experiment the penetration of the alcohol is only apparent; the fibers displace some of the alcohol, but the quantity is so small as not to be observable. If the cotton were compressed to the smallest possible volume, it would be found to occupy but very little space. So small a body would be incapable of raising the level of the alcohol enough to be appreciable by an ordinary observer.

THE ELECTRIC AGE.—The last 20 years have seen more advance in the science of electricity than all the 6000 historic years preceding. More is discovered in one day now than in a thousand years of the Middle Ages, so that, literally, "a day is a thousand years." We put it to all sorts of uses. We make it carry our messages, drive our engine, ring our door-bell, and scare the burglar. We take it as a medicine, light our gas, see by it, hear from it, talk with it, and now we are beginning to teach it to write. The question naturally arises in contemplating this subject, "What is it?" I can imagine the last man on the last day asking this same question, "What is it?" At one time, not long ago, it was supposed to be a fluid; by some two fluids, a positive and a negative. But in this day there are few who do not believe it to be simply a mode of motion; not matter, but a condition of matter; and not a mechanical, but a molecular motion. By mechanical motion is meant a motion of the mass, and by molecular motion is meant a motion of the ultimate particles of which the mass is made up.—*Ex.*

AN IMPROVED TELEPHONE.—An inventor has devised an improvement on the telephone which it is claimed will be of great practical advantage. The arrangement is contained in a small box, which is placed in proximity to the telephone and connected by wire. No name has yet been given it. A person is called upon the 'phone, and, if not present, the person speaking continues talking, the communication being electrically committed to wax-paper within the machine. When the person addressed arrives at the other end of the wire, he notices that a hall has dropped on the apparatus, which indicates that some one has been talking. Going to the 'phone he opens the switch, when all that has been said previously by the person at the other end of the line commences to be heard in precisely the same tone of voice and at the same rate of speed. The sheets of paper are 8 by 11 inches, and can at any time be placed in the machine and the sound be reproduced.

WEIGHING THOUGHT.—Starting with the idea that the hand varies sensibly in size with the amount of blood present in it at any moment, Professor Mosso, an Italian physiologist, has made some most interesting investigations. In his first experiments the hand was placed in a closed vessel of water, when the change in the circulation produced by the slightest action of the body or brain, the smallest thought or movement, was shown by a rise or fall in the narrow neck of the vessel. With a large balance, on which the horizontal human body may be poised, he has found that one's thoughts may be literally weighed, and that even dreams, or the effect of a slight sound during slumber, turn the blood to the brain sufficiently to sink the balance of the head. The changing pulse even told him when a professional friend was reading Italian and when Greek, the greater effort for the latter duly affecting the blood-flow.

DOES THE MOON INFLUENCE EARTHQUAKES?—Observations on the part of a large number of scientists prove that earthquakes are more frequent at the time of full moon and change of the moon than at other times, and also more frequent when the moon is nearest the earth or when she is on the meridian. The cause to which this fact has been assigned is the action of those forces which produce the tides of the ocean; their similar influence upon the solid land strata leads to their disturbance in the shape of earthquakes.

A CURIOUS PHENOMENON of last January has just been reported from the fishing village of Kersokharanza, on the White sea. The shore ice, piled to a height of several hundred feet, suddenly commenced moving from the north-west, and in four hours extended a mile inland, burying a village.

USEFUL INFORMATION.

Spiders' Webs in the Meadow.

I read a statement in this magazine, not long ago, about the spiders' webs that cover the fields and meadows on certain mornings in the summer, which was not entirely exact, writes John Barron in *St. Nicholas* for August. It is not quite true, in the sense in which it was uttered, that these spiders' webs are more abundant on some mornings than on others, and that they presage fair weather. Now, the truth is, that during the latter half of summer these webs are about as abundant at one time as at another; but they are much more noticeable on some mornings than on others—a heavy dew brings them to view. They are especially conspicuous after a morning of fog, such as often fills our deeper valleys for a few hours when fall approaches. They then look like little napkins spread all over the meadows; I saw fields last summer, in August, when one could step from one of these dew-napkins to another for long distances. They are little nets that catch the fog. Every thread is strung with innumerable fine drops like tiny beads. After an hour of sunshine the webs, apparently, are gone.

Most country people, I find, think they are due to nothing but the moisture; others seem to think that the spiders take them in as morning advances. But they are still there, stretched above the grass at noon and at sunset, as abundant as they were at sunrise, and are then more serviceable to the spiders, because less visible. The flies and insects would avoid them in the morning, but at midday they do not detect them so readily.

If these webs have any significance as signs of the coming weather, this may be the explanation:

A heavy dew occurs under a clear, cool sky, and the night preceding a day of rain is usually a dewless night. Much dew, then, means fair weather, and a copious dew discloses the spiders' webs. It is the dew that is significant, and not the webs.

A NEW WOOD PULP PROCESS.—The Mitscherlich wood pulp process is thus described by the *Southern Trade Gazette*: About two shovelfuls of flour of sulphur are thrown into the furnace every hour and there allowed to smolder while the fumes rise from it. Above the furnace is a series of cooling pipes, upon which a spray of water continually plays and through which the fumes pass into the vats containing the water and milk and lime. The fumes are drawn through the system of vats by a large vacuum engine, and all the vats are provided with revolving dashers, which agitate the liquor and facilitate the action of the sulphur fumes upon it. The machine that chips up the logs is a large one, and can devour an eight-inch log with ease; and the chips are considerably finer than in the soda process. A blast blows the chips into a bin, from which a conveyor takes them to the digester. After sufficient treatment in this the contents are discharged into a blow pit, whose ventilator shaft is provided with a trap to prevent the escape of any of the product. The success of this plant will lead to the construction of another and larger one.

THE QUALITIES OF A GOOD ROPE.—A German paper, in an article on the present methods of rope manufacture from hemp, and the determination of the different qualities and probable strength simply from the appearance, lays down the following rules: A good hemp rope is hard, but pliant, yellowish or greenish-gray in color, with a certain silvery or pearly luster. A dark or blackish color indicates that the hemp has suffered from fermentation in the process of curing, and brown spots show that the rope was spun while fibers were damp, and is, consequently, weak and soft in those places. Again, sometimes a rope is made with inferior hemp on the inside, covered with yards of good material—a fraud, however, which may be detected by dissecting a portion of the rope, or, in practiced hands, by its behavior in use; other inferior ropes are made from short fibers, or with strands of unequal length or unevenly spun—the rope in the first case appearing woolly, on account of the number of ends of fiber projecting, and, in the latter case, the irregularity of manufacture is evident on inspection by any good judge.

ELECTRIC LIGHT CARBONS.—Of 150,000 carbons burned daily in the electric lights used in the United States, 100,000 are manufactured in Cleveland, Ohio. Six years ago all the carbons burned in this country were made in a single room in Boston. Now there are 20 carbon furnaces in Cleveland alone. The carbons are made chiefly of the residuum of oil after it has been refined, and the deposit about natural-gas wells is also coming into use. The material is ground to a powder, a little pitch is added, and the substance is then placed in molds. These are packed in boxes and the latter placed in a furnace, where they are subject to the most intense heat. The capacity of an ordinary furnace is 45,000 carbons.

DIMENSIONS OF WATER-PIPES.—In the case of laying pipe to convey water from an elevation through a considerable fall, a prominent expert of Nordhoff, Ventura county, Cal., has kindly furnished the following opinion regarding the dimensions of the pipe laid. He says: "As to the beneficial effects on the flow

by introducing a large mouth-piece in the pipe, this influence comes if the pipe has a length of more than 2000 times its diameter. If, for instance, a six-inch pipe is 1000 feet in length, its discharge is not increased by this means. As the pipe shortens this influence increases, so that, if the six-inch pipe were only 250 feet long, a mouth-piece would add about 7 per cent to the flow; if 50 feet long, about 13 per cent; if 25 feet long, about 18 per cent; and if 5 feet long, about 31 per cent. For the most economical use of pipe on long lines it is preferable to use a pipe of uniform diameter."

INDIA PAPER.—India paper, which the Chinese call *lehi*, is made from hemp, mulberry bark, cotton, bamboo, rice straw, barley straw, and from the interior membranes of silkworm cocoons. Sometimes the whole of the stalks of a year's growth are used. The pulp is mixed, after it has been prepared, with a given proportion of a vegetable gum called *hotong* in China. This paper is molded in molds made of fine bamboo filament. These sheets, 60 feet in length, which the Chinese are said to make, are supposed to be fabricated by artfully joining several small sheets at the moment of laying the paper. India paper, being too thin to bear handling or any strain, is mounted on vellum, which serves as a lining to it, and the white borders of which set it off as a frame would do. The sheets are kept in a dry place, far away from the fire, and may be preserved for years.

A NEW LAMP-BURNER.—A lamp-burner has been patented by Mr. Arthur Cautius of Berlin, Germany. The wick tube consists of two concentric tubes, with a space between them for the wick, the inner tube being shorter and the outer one longer and provided with a flange covering the top of the wick, the burning portion of which will be on the inside instead of the top, between the flange and the top of the inner tube.

A REMEDY FOR TENDER FEET is cold water, about two quarts, two tablespoonfuls of ammonia, one tablespoonful of hayrum. Sit with the feet immersed for ten minutes, gently throwing the water over the limbs upward to the knees. Then rub dry with a crash towel, and all the tired feeling is gone. This recipe is good for a sponge bath also.

THE SUNFLOWER IN MALARIAL DISTRICTS.—It is stated that since the sunflower has been cultivated on certain swamps of the Potomac, malarial fever has decreased. The sunflower emits large volumes of water in the form of vapor; and its aromatic odor, as well as the oxygen it exhales, may have to do with the sanitary influence in question.

GOOD HEALTH.

Blood-Poisoning from Dyes.

Some journals take great pleasure in communicating sensational stories about terrible blood-poisoning cases from garments which were dyed with alleged "poisonous dyes," often corroborated by the statements of physicians; but, strange to say, remarks the *Textile Colorist*, we never hear of blood-poisoning among dyers, who daily handle those so-called poisonous dyes, even with chapped hands, as abrasures and small cuts in the hands do not unfrequently occur in the dyer's work, and they would certainly be the persons most exposed to blood-poisoning if the disease were attributable to the dyes.

Editors, even of technical papers, however well posted they may be in other matters, who make capital out of such alleged "blood-poisoning" cases, are probably seriously deficient in knowledge as to dyeing operations and processes; and much less knowledge of these operations and processes can be expected in doctors who, without hesitation, prescribe small doses of poison to be taken internally, but do not know how infinitely smaller actually is the quantity contained in a garment, through dyeing, of any poisonous substance possibly used in manufacturing a dyestuff or mordant. The testimony and opinion of physicians, who often want to shine in the light of great learnedness, or find it in their interest to represent an uncommon case of disease as most dangerous, and who but rarely have an occasion to apply their, at best, but imperfect knowledge of chemistry, must sink into nothingness in the presence of the statements of chemists who must be considered authorities by the extensive practical application of their science in cases of that kind. In the annual official report on the work of the public laboratory in Dresden, we find the following remarks on the interesting question of blood-poisoning by dyed garments:

Special investigations have been instituted regarding the question, whether certain tar dyestuffs, especially azo dyestuffs, were to be included in the law concerning the use of dyestuffs injurious to health. They were left out, however, because experience affords as yet too little proof of the harmlessness or injuriousness of these dyestuffs.

In this laboratory numerous cases were investigated in the course of the year where garments dyed with aniline dyestuffs were alleged to have caused eruptions upon the skin. There were red dyed stockings (the hobby of doctors), green silk ribbons, blue wool. In all cases the objects suspected of being dyed with poisonous dye were submitted for examination; but in no case deleterious dyes, in the sense of the law,

could be detected. All the dyes were free from arsenic, as altogether the aniline dyestuffs containing arsenic have nearly entirely disappeared in commerce.

The question about the injuriousness of aniline dyestuffs can only be decided by means of physiological experiments upon animals, and the questions concerning the production of eruptions upon the human skin will probably be very hard to solve, because there, besides the mordants and the textile material itself, the greater or less susceptibility of the individual must be taken into consideration. In fact, in by far the majority of cases which have come under my knowledge, only a very uncertain opinion could be formed as to whether the material, the mordant or the dyestuff had most contributed to produce the irritation of the skin, or the eruption.

A New Way to Induce Sleep.

The *London Spectator* makes the following novel and apparently philosophical suggestions:

"It is now, I believe, generally accepted that our conscious, daylight-thinking processes are carried on in the sinister half of our brain—i. e., in the lobe which controls the action of the right arm and leg. Pondering on the use of the dexter half of the brain—possibly in all unconscious cerebration, and whatever may be genuine of the mysteries of planchette and spirit-rapping, I came to the conclusion (shared, no doubt, by many other better qualified inquirers) that we dream with this lobe, and that the fantastic, unnatural, spirit-like character of dreams is in some way traceable to that fact.

"The practical inference then struck me. To bring back sleep when lost we must quiet the conscious, thinking, sinister side of our brains, and bring into activity only the dream side, the dexter lobe. To do this the only device was to compel myself to put aside every waking thought, even soothing and pleasant ones, and every effort of daylight memory, such as counting numbers or repetition of easy-flowing verses, the latter having been my not wholly unsuccessful practice for many years. Instead of all this I saw I must think of a dream, the more recent the better, and go over and over the scene it presented. Armed with this idea, the next time I found myself awakened at 2 or 3 o'clock in the morning, instead of trying merely to banish painful thought and repeating, as was my habit, that recommendable soporific, 'Paradise and the Peri,' I reverted at once to the dream from which I had awakened and tried to go on with it. In a moment I was asleep! And from that time the experiment, often repeated, has scarcely ever failed. Not seldom the result is hidden as the fall of a curtain, and seems like a charm.

"A friend to whom I have confided my little discovery tells me that without any preliminary theorizing about the lobes of the brain she had hit upon the same plan to produce sleep and had found it wonderfully efficacious."

MASSAGE AS A HEALTH RESTORER.—A writer in *Cassell's Magazine* commends massage as a producer of sound, wholesome sleep in persons afflicted with insomnia. He also claims that lumbago, stiffness in the joints, sciatica and many kinds of headache readily yield to this treatment, and liver and heart complaints are greatly benefited. It may often take the place of exercise when that cannot be easily had. Massage is a splendid tonic to the whole system. It is a safe tonic. Massage keeps the skin in good working order, and all other glands as well. To people troubled with gout and chronic rheumatism it very often proves invaluable, while various forms of paralysis yield to the new-old cure.

TO STOP BLEEDING AT THE NOSE.—A simple plan of stopping bleeding of the nose has lately been advised. Grasp firmly the nose with the finger and thumb for 10 or 15 minutes; by thus completely stopping the movement of air through the nose (which displaces freshly-formed clots) you will favor the clotting of the blood, and will frequently stop hemorrhage.

IS THERE ANY DEATH FROM OLD AGE?—A physician whose practice is in a large and healthy district expresses the belief that death from old age never occurs. He thinks that some attack of disease, however slight and difficult of diagnosis, some intensifying, perhaps, of previously existing chronic disease, invariably brings about the final change.

A NEW DISINFECTANT.—A new and powerful disinfectant, adapted to all purposes, has been obtained in Paris from coal oil. It is a syrupy brown liquid of a not disagreeable odor, resulting from a peculiar saponification of the oil by caustic soda. It destroys moss and fungus on trees, and sponging with a weak solution keeps flies from horses.

MICROBES.—The idea that all microbes are injurious to health, says the *Sanitary News*, is a very common one, even among those who pose for well-informed persons. The fact is that they are now believed to play a not unimportant part in the process of digestion and the transformation of food into assimilable form.

LEMONS IN HOT WEATHER.—A safeguard against the prevalent summer illness lies in the free use of lemon juice. Citric acid helps to supply the places of the fluids which are unduly dissipated through the pores of the skin in hot weather.

The Poorman Concentrator.

This magnificent mill, said to be the largest of the kind in the United States, and probably in the world, was started up yesterday, and it is drawing it very mild to say that a trip through the huge building, with its massive machinery, is a matter of more than ordinary interest. The structure is immediately opposite the Tigor concentrator. It is 193 feet long and 72 feet wide, with a corresponding height. The building is divided into four compartments—the boiler-house, the ore and rock-braking room, the jigger and table-room and the sacking-room. The engine is of 120-horse power, but steam-power will only be used during the dry season.

In the Spring Months

Water-power will be employed, and a flume and wheel are already constructed. The jiggers are different than those in use in the other mills in the camp, and it is claimed that less power is required to run them. The concentrating tables are round and six in number. They are of huge size. A singular feature, however, is what is termed a "grinder," which receives the refuse and after it leaves the jiggers is ground into powder and then pumped back into the jiggers to take its course through the first process. It is claimed that much valuable ore sticks to the small particles in the rock and is thus saved to the company. In the sacking-room there are a number of reservoirs for catching the very fine float concentrates which are lost in other mills in the camp. These reservoirs are in the shape of baths, and it is difficult to see how much of the valuable stuff can escape them. They are supplied with a

Constant Flow of Water.

The mill is very substantially built, and evidently no expense has been spared to make it the most complete institution of the kind ever constructed. Its capacity is 150 tons of ore per day. While this requires an enormous daily production, there is every indication that the Poorman mine will be equal to this occasion and feed the monster with the requisite amount of ration. The developments in the mine show a continuous ore body of from five to seven feet in width for 500 feet, and a double compartment shaft is now being sunk which will open up the mine 100 feet below the water level. A 70-foot shaft has already demonstrated the existence of a fine body of ore on the west end of the claim, and it is natural to suppose it continues all along the fissure. Everything indicates that mining will be done on a broad-gauge plan, and quite naturally more than ordinary interest centers in the movements of the Poorman Co. This mill is a monument of enterprise, and shows the confidence that is felt in our mines by active mining men.—*Murray Sun*.

Circular Sewer-Covers.

The *Young Scientist* takes this subject of circular sewer-covers for its text, and discourses as follows: In ancient times the circle was the emblem of eternity and the symbol of completeness, and these ideas seem to have created a sort of reverence for this emblematic figure, so that it has been regarded as the height of perfection for many purposes. Indeed, such a firm hold did this view take of the general mind, that even the tube with a circular section was at one time considered the strongest form into which any material could be molded, and it produced a great deal of astonishment among those who held this view when Stephenson and Fairbairn showed that the circle was inferior to the rectangle in strength as well as in other points. Is, is, no doubt, the lingering influence of this blind reverence that causes our city engineers to adopt the round form for the covers of the manholes of street sewers. In most of our small cities the round form has been adopted, where very little consideration would have shown that it is one of the worst forms that could have been selected. The reason for this is simple enough! Whenever the street settles or gets worn below the level of the top of the sewer-cover—and most streets in small cities and country villages do get so worn down—unless the wheels of the passing vehicle strike the cover fairly in the center, the edge of the cover acts as an inclined plane to push the wheels to one side, in which case it is sure to give the vehicle a severe wrench. Now, if the cover had been square, or at least rectangular, this would not have occurred. A wheel striking such a cover at any part of its edge meets it squarely, rises over it and rolls across the surface without any hitch whatever.

As it is now, the round covers cause a damage of thousands of dollars to the vehicles in the cities where they are used, and they, themselves, are rapidly destroyed. We have seen some inches worn off a cast-iron sewer-cover by passing vehicles, and the cover nearly destroyed. A square cover would have suffered no such damage.

The Owens River Canal Co. let a contract August 25th to H. H. Spear, for work on the canal, for \$11,000. The distance covered by this agreement is from the head of the ditch to Claussen's, 9½ miles, less the portion now under contract. The ditch must be finished within 18 months.

To MEND PATTERNS, or making additions where but a few molds are to be made, the following solution will be found very useful: Melt together one pound of hesswax, one pound rosin, and one pound of paraffine wax.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

ZEILE.—Amador *Expositor*, Sept. 15: Sinking operations have been commenced at this mine. Twelve men are engaged in this work, in three shifts of eight hours each. The rock was found to be so hard that it was deemed too slow for hand-drilling. A machine drill has therefore been called into requisition, and the work will advance much more rapidly.

KENNEDY.—Sinking has been finished in the main shaft of this mine. Drifts have been run north and south at the 1050 level, showing the ore body to exist at that depth in undiminished size and quality. At first the ledge was found rather pinched, but it has since widened out to five or six feet thick. The mill is kept running to its full capacity of 40 stamps. Sinking at the north shaft continues.

MISCELLANEOUS.—It is reported that all arrangements for the sale of the Amador Queen mine in Hunt's gulch have been satisfactorily completed. Mr. Wright, who bonded the Cleveland mine, above Big Bar bridge, and who left for the East with the probability of proceeding to Europe to place the Cleveland and other mines with an English syndicate, has not been heard from for several weeks. One crushing was made by the five-stamp mill, which yielded, we are informed, an average of about \$9 per ton. The Reaves and Way mine, or Plymouth Extension, as it is now called, has been sold to the parties in New York who bonded it over a year ago. The bond was allowed to lapse, but the parties made a cash offer—\$10,000—and that sum has been paid and the matter settled. The Plymouth mine, according to all reports, will start up to-day, Saturday. There is no further trouble apprehended from fire. It will take until November to drain the shaft, and until this is done the damage from fire and flood cannot be ascertained with any degree of correctness.

El Dorado.

NOTES.—*Observer*, Sept. 18: Andrew Ellicott of Slate Mountain has been on a visit to old friends at Smith's Flat for a few weeks. Mr. Ellicott was an early settler in this part of El Dorado county, and was the discoverer of the old New York mine at Poverty point, nearly 30 years ago. Mr. Ellicott is well past the meridian of life, and by untiring industry has acquired an ample competency with which to carry himself easily down the grade of declining years. We were shown, by Marco Vazozza one day last week, some ore taken from a ledge near the Baltic mill, which was remarkably rich in gold. The ledge is nearly two feet wide, on which a shaft has been sunk to a depth of over 50 feet, which prospected big from the grass roots down. The ledge is owned by Marco and L. Campini. The former is now at the Baltic, having departed for that place last Thursday, giving the mine his personal attention. About two months ago Thos. Potts of Smith's Flat started a tunnel to strike a body of gravel which had been tapped from an old tunnel many years ago. In the new tunnel Mr. Potts has made an unexpected discovery, by running into the edge of a channel of ground which prospects \$1.25 to the pan. The bedrock pitches down as the tunnel advances, and with that pitch the gravel increases in thickness.

FROM GRIZZLY FLAT.—Mr. McDonald, supt., has a few men working on the Mt. Pleasant. The ledge is reported to be over five feet wide of good ore. Charley Jones and Lafe Mesmore are running a tunnel at the Dryer mine to strike the ledge, when they expect good ore. Thos. H. Russell and R. K. Clabourne are taking out fine ore from the Mt. Hope mine. The Big Bonanza is turning out rich ore showing galena and free gold. Alex. McAfee is sinking on the Ohio mine and has a ledge now 5½ feet wide of very promising ore.

Fresno.

THE STAR MINE.—*Expositor*, Sept. 12: Messrs. J. M. Shopp of Missoula, Henry Klein and J. L. Waggener of Helena, Mont., are visiting Fresno. They are part owners of the Star mine at Mount Raymond, in this county. They report that they are putting up extensive works for operating the mine. The Mount Raymond mines carry gold, silver and lead. The average of the ore runs about 22 ounces of silver and 20 per cent lead per ton. This ore they intend working by grinding it and concentrating the minerals. The concentrations will be packed and shipped to San Francisco and sold to the smelting works there. The works when completed will have a capacity for crushing and concentrating 100 tons of ore per day, but another season they will double its working powers. They estimate that they can mine and mill the ore for \$1.50 per ton. They describe their mine as a true fissure vein of giant proportions—a perfect mountain of ore, so to speak. The supply of ore is almost inexhaustible. All they have to do is to blast it out and convey it to the concentrating works. They expect to get their concentrating machinery in operation in about 90 days.

Mariposa.

GOOD MINE.—*Mariposa News*, Sept. 15: The old shaft in the old Marguerite mine, now known as the Grove & Ellingham, at Whitlocks, has been cleaned out at last. The bottom level extends a distance of 235 feet on a body of ore that averages two feet, and will mill from \$8 to \$12 to the ton of free gold. The quartz is very rich in sulphurets. This mine gives every promise of being one of the best in the State. The shaft will be put down about 100 feet more, and levels run. A steam pump will be put in at once.

Nevada.

CONSOLIDATED BANNER.—*Transcript*, Sept. 13: The property is located three miles north of Nevada City, Cal., and four miles northeast of the town of Grass Valley, both places being well known and prominent quartz-mining centers. The Banner mine was located by Pressy & Co., in 1863, who worked the mine for a short time and then sold it to Mr. William Tisdale and Mr. George W. Kidd. The latter operated the mine for about two years. We are sure that the mine paid them while they managed it \$250,000, principally in free gold, as the

treatment of sulphurets at this early date was very imperfect and not as assured as at present. The mine has been worked for periods of several years at a time and has produced \$750,000—principally free-milling ore. The vein is a true fissure one in slate walls running north and south, pitching east. The chute is 250 feet in length, averaging 5 feet in thickness; this was worked to a depth of 620 feet. At the time the mine was being operated the milling machinery was inferior to that now in use for free gold, and particularly so for sulphurets, as the latter which contained a large per cent of gold were virtually allowed to be wasted. In those early days they did not have the "Frue Vanner" and other concentrators that are now the necessary adjuncts in all quartz-mills. The processes then of saving the sulphurets were simply crude experiments. Other kinds of mining machinery have been vastly improved, so that to-day, Nevada county, Cal., is the Mecca for persons interested in the treatment of quartz rock. By the great improvement in machinery the ore can now be worked for less than one-half the former cost and the yield of gold will be doubled. During the past year about 100 tons of ore averaging \$50 per ton were taken from the 120-foot level. This ore had been left by the old company at that level. The yield of the same kind of ore at the time of the original operation of the mine was \$23 per ton, thus showing that by the new process of treating ores the yield had been more than doubled. There is upon the ground complete machinery for unwatering the mine and exploring it. Tools and all plant necessary are now owned by the company. The vein at the bottom of the shaft was well defined, large and apparently as good as at any time in the history of the mine. When we say "shaft" it should properly be called an incline, as the vertical depth of the opening is only about 350 or 400 feet. Miners in those argonaut days of quartz mining did not believe, as a rule, that pay chutes extended down to any great depth, but the history of the mines in this section shows that they have often proved unprofitable at a depth of 400 or 500 feet, and rich at lower levels. There has never been an assessment levied during all the time the mine has been worked. In addition to the current expenses of the operation, it paid a dividend of \$48,000, and its construction account was \$175,000, which may be regarded as an additional profit. It is proposed to unwater the mine, sink a shaft or incline to a depth of 300 feet more than at present, to explore the old workings.

PIONEER QUARTZ-MILL.—*Grass Valley Union*, Sept. 13: Wm. S. May, who has the contract for building the works on the Pioneer quartz mine, the property of James G. Fair and A. E. Davis, on Humbug canyon, Placer county, went over last evening to look after the work which has already been commenced, an advance party having preceded him. The heavy machinery will be sent from Colfax by way of Iowa Hill. The lumber for the mill will be furnished by the Sugar Pine mill, which is above Iowa Hill in the direction of Humbug canyon. Mr. May expects that it will take about 70 days from the present time to complete the mill and other work included in the contract. The foundations of the mill are now being excavated, and a tramway leading from the mine to the mill-site is well under way, under the direction of Mr. Everett, who has been on the ground for several weeks.

TUNNEL HILL.—*Herald*, Sept. 14: There is a ledge on Tunnel Hill, near the South Yuba canal, which is looking very promising. It is in slate formation and runs across the country rock, east and west. Palmer & Co. of Washington are sinking a shaft upon it for a share in the mine. They are getting very good prospects.

San Diego.

JULIAN MINES.—*Sentinel*, Sept. 14: About five miles from Julian are a group of mines owned by Messrs. Hamilton, Melrose and Feeler, which were discovered last spring. The formation of the country is granite and slate. The parties have two shafts down 40 feet, and on the Gold King mine the outlook is splendid, the rock being very rich, the owners mortgaging out good wages. Around this mine they picked up 20 tons of float rock, all showing free gold. The shaft shows a strong vein all the way down, and at the bottom the ledge is wider and very rich. They also have another mine called the Gold Queen, which looks fully as well as the Gold King. The Fraction mine, which is situated in the Banner district, is extracting very rich ore. The vein is from four to ten inches wide, and very rich in free gold. At present the Cincinnati mine is idle, owing to the bad air. The owner is trying to put up some apparatus to convey air through the mine. The Ready Relief mine is still pushing its lower level forward. They are now in 500 feet, and a good body of ore is in sight. When this level is in 350 feet further it will throw a body of ore overhead 100 feet high by 400 feet long; the level above this one was worked for 14 years, and paid several hundred thousand dollars. The Warlock mine is paying good wages to its owners. They have a good ledge in sight and will soon make big shipments of ore. The Ruby and Hidden Treasure mines are doing well.

RED HILL.—*Julian Sentinel*, Aug. 24: This mine is situated in the Mesa Grande district, and was discovered by Fred Scholder. The formation is red gouge and slate. On this hill and in this claim are hundreds of little strata running in different directions carrying gold paying from \$20 to \$300 per ton; the gulches running from the bill carry placer gold and were worked years ago. In working these gulches the parties were led to this red hill and they began to find float quartz; this caused an excitement which led to the sinking of shafts all over the hill. In most of these shafts strata would be struck which were immensely rich, but none of the parties were experienced in mining, so in a few years the mine became idle. In 1881 J. M. Farley and others purchased the mine, doing work enough each succeeding year to hold the assessments, and finally this year concluded to work the mine for all it was worth. After reviewing the ground they concluded to sink 100 feet and crosscut to find the main ledge. Upon sinking the shaft to a depth of 60 feet they struck a vein two feet wide which will average \$25 per ton, and the ore improves as they go down. The boys are elated and talking quartz-mill already. The outlook is certainly a splendid one and in the near future this will be a good mine, pouring out considerable bullion.

REDUCTION WORKS.—*National City Record*,

Aug. 30: The Reduction Works are forging right ahead and are beginning to attract much attention throughout the country. Communications are being received by Superintendent Chick from all sections concerning ore shipments and when the works will be ready to make contracts. Large quantities of ore are being brought to the city from the mines for mill tests, which are being made daily. One lot brought from a point not far from National City, ran \$120 to the ton, and was pronounced perfectly free-milling. Mrs. L. De Garfias showed some very rich quartz in National this week. It was taken from a claim which she owns about 15 miles below the line.

Shasta.

IMPORTANT SALE.—*Shasta Courier*, Sept. 15: The group of mines on Dog Creek, near Delta, in which Wm. M. Murray was part owner, has been sold to Whitacre Wright of Philadelphia, for \$36,000. As to the richness of these ledges, there is no doubt.

NIAGARA MILL.—James Southerland, superintendent of the Niagara mill and mines in French Gulch District, was in Shasta this week. The great works and mine plant under his supervision are in a flourishing and prosperous condition, and everything moves along with the precision of a clock.

Sierra.

THE MARGUERITE.—*Tribune*, Sept. 14: Work is progressing favorably at the Marguerite mine. Superintendent Morris has leased the old Dutch ditch with the privilege of buying it at a future time. This will always assure an abundance of water to run machinery with.

Trinity.

QUICKSILVER.—*Journal*, Sept. 15: Supervisor Vollmers of Trinity Center was in town the first of the week, and says a good deal of work is being done on the quicksilver mines near Cinnabar. The Altoona Company has 22 men at work and by spring will have over 100 men in their employ. Carpenters, miners, road-builders and brick-makers are all at work and the camp presents a lively appearance. A large supply of brick is being made for the construction of smelting furnaces. In sinking a shaft, double the quantity of ore in sight in any part of the mine was exposed. The ore is very rich, some of it yielding as high as 75 per cent in quicksilver. At present, work on the mine consists of retimbering old tunnels and running prospecting tunnels so as to get things into shape to work on a large scale. Mr. John Lytle, the original discoverer and locator of the Altoona, is the superintendent, having come up from Tulare county to take charge of the mine.

Tuolumne.

NOTES.—*Union-Democrat*, Sept. 15: Louis Blanding, the metallurgist, assayed some silver and gold ore this week from a lode about 40 miles from Sonora. It was rich in gold and silver, going far up into the hundreds of dollars. Messrs. Thos. Birney, Joseph Hudson, John O'Hara and Al. Harkness are working night and day on their Bald Mountain claim. Mr. Harvey Wood and son were in town Monday from Robinson's Ferry. He reports big improvements and extensive operations there consequent on the purchase of large mining interests by the English syndicate. Work was commenced on the Bonanza mine Tuesday. The present management intend to go down as far under the water as the gold goes, no matter how far that may be. To that end substantial improvements are now making in the mode of timbering and development. May the "old Bonanza" always have roots.

THE BALTIC.—*Tuolumne Independent*, Sept. 15: The Baltic mine, the property of Louis Page and Dave Oliver, is being pushed rapidly forward. They depend on the Tuolumne Co. water ditch for necessary power to work the machinery, and through its giving away twice, they have had their pump stop and the mine fill up with water as many times. The shaft is now down about 125 feet below the creek or water level; a cut has been made 325 feet in length and continued by a tunnel running some 650 feet more.

Ventura.

BITUMINOUS ROCK.—*Free Press*, Sept. 7: Tests are constantly being made with the bituminous rock found near here, with the most satisfactory results. There is now little doubt that it is the best quality yet discovered on the coast. If it exists in sufficient quantity to warrant the building of a railroad track to it, it will prove of more value than a gold mine to the owners and the community.

NEVADA.

Washoe District.

HALE & NORCROSS.—*Enterprise*, Sept. 15: Since last report we have received complete returns from the United States Mint of the bullion from 2615 tons of ore worked at the Nevada mill last month. Gross yield, \$87,142.52; gold, \$44,310.96; silver, \$42,841.56. On the 500 level the main west drift has been advanced 35 feet and the south drift 28 feet. The south upraise above the 600 level is advanced 70 feet, and the north upraise the same distance. We have completed the new working station from the 800 level of the vertical shaft and have started a drift west therefrom.

GOULD & CURRY.—The El Dorado level east crosscut from main south drift has been extended 21 feet; total, 56. Formation, low-grade ore. The north drift started from west crosscut No. 2 has been extended 25 feet; total, 45. Upraise 45 feet south of crosscut No. 2 has been carried up eight feet; total 100. East crosscut from top of this raise has been advanced eight feet. Formation, porphyry. The drain tunnel level south drift started from east crosscut No. 2 has been extended 27 feet; total, 39. Face in good milling ore.

CON. CAL. & VIRGINIA.—On the 1300 level have completed the work of retimbering the main south lateral drift. On the 1435 level the east crosscut started from south lateral drift No. 2 at a point 70 feet south of west crosscut No. 1, has been extended 16 feet; total, 46. This crosscut is still in porphyry, with quartz carrying some value. Have continued to extract the usual quantity of ore from the stope east of the winze below this level. On the 1500 level the parallel north has been extended 18 feet; total length north from east crosscut No. 1, 148 feet. Have continued to extract ore from the southeast drift which runs from the upraise above the parallel north drift 53 feet above the track floor of

this level. On the 1600 level continue to extract ore from the stope around upraises Nos. 1, 3 and 4, carried up from the face floor of this level; also, extracting ore from the drift running south from the Ophir line, 56 feet above the track floor of this level. On the 1650 level, the upraise from the drift running south from the east drift from the Con. Va. shaft has been carried up 21 feet; total, 66. Are continuing to stope out ore at the end of the south drift.

BELCHER.—The 500 crosscut is now in 212 feet and shows no change since last report. Have repaired and rest the incline sheave since last reported and repaired and retimbered the station. Will start a drift north from the shaft this week on the 200 level to connect with the Crown Point south drift, 160 level, which is extended to our north line. The Suro tunnel drift is out 700 feet.

SAVAGE.—On the 300 level the south drift has been advanced 32 feet, and continues in fair-grade ore. The car samples average \$28 per ton. We have resumed work in the face of the southeast drift on the 400 level. We have men on repairs, easing timbers and prospecting the several levels of the mine.

BEST & BELCHER.—West crosscut No. 1 from main northwest drift has been extended 29 feet, total, 145. Formation, quartz giving low assays. The main northwest drift has been extended 39 feet; total, 51. Formation, porphyry and quartz.

CROWN POINT.—Started No. 1 crosscut west from the 700 south drift during the week and advanced it 30 feet. The face shows bunches of quartz, but is principally clay. Expect to strike the ledge in a few feet. The Suro drift is out 700 feet.

ALPHA AND EXCHEQUER.—The east crosscut on the 382 level of Exchequer is in 90 feet. The face is in clay and porphyry. The east drift in Alpha is in from the old shaft 95 feet, the last 8 or 10 feet showing fair ore.

WEST YELLOW JACKET.—Made connections with incline and struck a body of low-grade ore, about \$20 rock. There is a very rich seam in the body. Will run the drift about 20 feet before opening up.

SIERRA NEVADA.—On the 520 level, east crosscut No. 2 from the main south drift has been extended 54 feet; total, 304. This crosscut is still in a porphyry formation, carrying some quartz.

OPHIR.—On the 1465 level the old east drift from the shaft station has been extended 39 feet; total distance reopened and retimbered, 204 feet. Have completed the repairs to the shaft station.

YELLOW JACKET.—Surface repairs are progressing satisfactorily. The foundation to the machinery was found in a much worse condition than was expected, but a substantial job is being done.

OCCIDENTAL.—On the 48 and 100 levels are stopping ore. Have extracted 144 tons of ore and shipped to the Atlanta mill 150 tons. Value of wagon samples \$29.50 per ton.

UNION CON.—The joint Union and Mexican north drift, started from the east drift from the Ophir shaft on the 1465 level, has been extended 60 feet; total, 248.

CHOLLAR.—The work during the week has been confined to repairs on the different levels. Have opened a new station on the 750 level, which is timbered in 26 feet.

CONFIDENCE.—Necessary repairs to different portions of the mine, which could not be conveniently done while ore was being extracted, are now being carried out.

MEXICAN.—The joint Mexican and Union shaft drift, started from the east drift from the Ophir shaft on the 1465 level, has been extended 78 feet; total, 188.

ANDES.—Will commence to retimber the shaft next week. It is much out of repair. Are crosscutting on the 240 level and drifting on the 350 level.

KEYES.—Patrick Keyes reappointed superintendent in full charge, and all others bounced. Work will be vigorously prosecuted in the mine.

UTAH.—On the 472 level the east crosscut has been extended 45 feet; total, 140. The formation is porphyry showing some water.

ALTA.—Usual work being done and extracting and concentrating the usual quantity of ore from the 825 and the 1150 levels.

SCORPION.—South drift on 500 level extended about 15 feet during the week. No change in the ground to report.

JUSTICE.—Usual operations going on. The work of putting up the new mill is prosecuted vigorously.

POTOSI.—The south drift on the 650 level is in 384 feet—all in quartz giving low assays.

BALTIMORE.—The work is progressing satisfactorily on the 382 level.

BULLION.—The usual work only is reported this week.

Tuscarora District.

GRAND PRIZE.—*Times-Review*, Sept. 14: Repairs on the shaft are now finished and water being hoisted day and night.

COMMONWEALTH.—100-foot level: No. 2 south drift has reached the south-end line, and joint crosscut started west to intersect the upraise from 150-foot level. The crosscut has been advanced 31 feet, cutting some very fine ore, assaying \$190 per ton. In the north intermediate drift have been putting in timbers. The ore being exposed is as high grade as any ever extracted from the mine. 150-foot level: No. 3 north drift from east crosscut has been advanced 18 feet. No. 1 north drift from No. 1 west crosscut has been extended 12 feet, without any particular change. No. 2 winze from east lateral drift has been sunk 11 feet, showing good ore in the bottom. The south drift from 225-foot level has been extended 22 feet, cutting some very fine ore. The course of the vein is very near the same as the drift, so the drift will penetrate farther in as it advances. Assays show from \$33 to \$291 per ton.

NORTH BELLE ISLE.—East crosscut No. 2 north, 300-foot level, extended five feet in very hard rock. Joint upraise from the 400-foot level extended 22 feet. The high-grade ore has continued in good width the whole distance from the 400 level. The stope on the 300 have yielded their usual quantity of high-grade ore.

NEVADA QUEEN.—Joint crosscut from Commonwealth south drift, 100-foot level, has been advanced 31 feet. The face is all in ore assaying from \$30 to

\$450 per ton. This crosscut is being run to connect with the upraise from 150-foot level. The upraise had fine ore all the way up. The stopes have improved during the week; they yield a full supply for the mill. The upraise from 150-foot level has been extended up 22 feet, total 62 feet, carrying high-grade ore all the way.

NAVAJO.—The crosscut from the west vein, 350-foot level, has been extended six feet. The stopes on this level are looking well and are yielding some very high-grade ore. Some very fine ore is also being taken from the intermediate level.

FOUND TREASURE.—Southeast drift on southwest vein, 150-foot level, has been extended 10 feet. Crosscuts will be run in both directions from near the face of the drift. Southeast drift, 200-foot level, has been extended 20 feet.

BELL ISLE.—Crosscut from the north drift, 250-foot level, extended 12 feet. The stopes have yielded some high-grade ore.

DEL MONTE.—The combination shaft has been sunk and timbered nine feet. The rock in the bottom is quite hard.

NORTH COMMONWEALTH.—The combination shaft has been sunk and timbered nine feet; rock pretty hard.

ALASKA.

MINING ON THE YUKON.—Alaska Times, Sept. 10: A part of an interview with Mr. D. H. McNeill, one of the party who left with William Ogilvie to survey the northern country on behalf of the Dominion Government, says that mining carried on along the Yukon is done in this wise: The river freezes to a great depth, and on the banks and bars the ice is generally solid to the bottom. The miners cut away the ice and then dig up the gravel, which is also frozen, and carry it on the banks. This process is continued till the river breaks up for a couple of months, when the dirt is carried back again and washed for gold. In this way, says the informant, one man took out \$1000; but it is hard work. The gold is principally coarse, the largest nugget being valued at \$40. This nugget, it may be stated, was lost. The owner being drowned a short time after he found it. His name was Michael Sufferin, a native of New Brunswick or Ontario. Mr. McNeill has samples of the Yukon gold with him. Provisions are pretty dear. Flour is \$17.50 per 100 pounds; bacon, 40 cents per pound; beans, 30 cents; sugar, 30 cents; dried apples, 30 cents, of all of which there is a fair supply. During the winter there were 36 cases of scurvy among the miners, and three deaths occurred. The Indians on the Yukon are peaceable and willing to work.

ARIZONA.

THE OLD DOMINION COPPER COMPANY.—Silver State, Sept. 8: On Tuesday we availed ourselves of the invitation of Supt. A. L. Walker of the Old Dominion Copper Company, to inspect the company's mine, the Old Globe. Probably what impressed us most forcibly during our tour of the underground workings, after an interval of more than two months since our last visit, was the great change wrought in the appearance of the stopes, drifts and crosscuts. A copper furnace is a veritable gormand in its consumption of ore, and the daily output from a mine in constant operation very soon renders the ore bodies unrecognizable to a person who is only an occasional visitor. We believe we are within bounds in stating that the result of the present season's operations thus far, both in output and financial returns to the company, was never equaled in the history of the property, considering that, with the exception of a short period, only one furnace has been in blast, and a great amount of deadwork has been done. In fact the development work now in hand is the most important undertaken for years, and as it has progressed ore bodies have been encountered which, while not a surprise to the management, yet in extent, and the character and quality of the ore, are fully realizing all expectations. Work on the drift in the fifth level, to connect the present works with the new double compartment (Interloper) shaft, was discontinued some weeks ago to avoid a flow of water from the mine into the new shaft, which would interfere with sinking. However, this drift and the corresponding one on the fourth level will soon be driven to completion, as the shaft is down as deep as is desired for the present. With these connections made, most of the ore will be raised through the new shaft, which will make a material saving in the handling of ore, the greater part of which is now discharged through the Moony incline shaft and the first level tunnel, not without considerable labor. The new shaft is down about 310 feet, or below what will be the sixth-level station, and it will be sunk no further for the present. It is the intention of Superintendent Walker to soon begin the opening of a sixth level. In the drifts on the fourth and fifth levels before mentioned, fine ore was encountered, and the same character of ore was found also in the Interloper shaft, thus proving beyond a doubt the existence of a continuous ore body, the extent of which, while not yet accurately determined, is known to be large. In the drift on the fifth level, about 150 feet from the new shaft, a crosscut was started, and 25 feet is in good ore, which is widening out as work progresses. In the old workings, on almost every level, more or less ore is being extracted, but chiefly on the first, second and fifth levels, where the showing is excellent.

COLORADO.

NOTES.—Elk Mountain Pilot, Sept. 13: The Norman lode near Elko is developing into a good mine, the ore is galena with some copper pyrites. Mr. A. B. Williamson shipped his first carload of ore this week from the Pennsylvania tunnel. It went to the Pueblo sampling works. Mr. Baxter is working the Excelsior mine in Poverty gulch. He is driving the tunnel ahead on the vein. The Tabor mine has shipped two or three carloads of ore from here to Denver.

DAKOTA.

ELK MOUNTAIN.—Deadwood Pioneer, Sept. 9: The Elk Mountain Company is at present receiving bids for a contract to extend their present tunnel on the Comstock 50 feet.

FLOAT.—The battery for the Homestake steam stamp passed through the city last evening loaded

on two wagons and drawn by 13 yoke of oxen. Considerable activity is noticeable in what is known as Kintabaga gulch, and mine-holders in that vicinity are said to be meeting with very encouraging results. Corncock stockholders are jubilant over recent developments of the property. Recent advices from the Fremont state that work has been suspended for a short period on this property on account of the illness of one of the owners, it requiring the assistance of all in the further sinking of the shaft, which is now down about 50 feet. Directors of the Desire Mining Company held a meeting yesterday, at which an assessment of one-quarter of a cent was levied. Work is being vigorously prosecuted on the Big Owl and several other claims in that vicinity. When Dan Brown left Galena with the express yesterday morning, the Merritt smelter had turned out some 84 bars of bullion. The plant had then been in operation three and one-half days. Among many other properties rapidly coming to the front may be mentioned the Gold Hill. This property is located on the west side of Portland, and is one of the best developed properties in that vicinity. The last work done by the owners consisted of driving a 30-foot tunnel, in the face of which appears a 2-foot vein of ore of a very rich nature.

IDAHO.

SILVER FORTUNE GROUP.—Wood River Times, Sept. 12: The following is from an interview with Mr. McLeod, foreman of the above mine: The Silver Fortune, Oregonian, Snowdell and P K are four as good prospects for big mines as can be seen on Wood River. The four claims run end to end, and we have traced the length nearly the full length of 6000 feet, or for over a mile. We struck ore in every place where we did work, and I would not be surprised if we had an ore-chute over a mile long. If that is not the longest continuous argentiferous galena ore-chute in the world, I am much mistaken. We first got ore in the Silver Fortune, where we sunk a shaft 70 feet. That was the discovery. We traced the vein 600 feet from the discovery, made an open cut there, cut the vein, and found a nice showing of ore. On the Oregonian, which adjoins the Silver Fortune, we sunk a shaft 70 feet, found ore all the way down, traced the vein as far as we went, run two open cuts, and found ore in both. On the Snowdell we traced the vein, ran an open cut, sank on the vein 40 feet, and found ore. On the P K we've done no work besides tracing the vein on the surface. I think that for the amount of work done this is the best showing ever seen anywhere. East Fork is going to be a bonanza camp, and a year or two hence will see the Wood River region as productive as Leadville ever was.

CEUR D'ALENE MINES.—Wardner News, Sept. 8: In the Yreka district work is progressing very rapidly on the Last Chance mine and a large quantity of good concentrating ore is being daily added to the vast amount at present on the dump. The upper tunnel is being extended and a large force of men is engaged in stoping at various points. On the first of the month the lower tunnel was in 238 feet, and an addition of five feet has since been daily added to its extent. The vein will be cut when a distance of 440 feet from the starting-point is attained. The machinery for the concentrating works of this company is all on the ground and is being put in place as rapidly as circumstances will permit.

LALANDE DISTRICT.—The Gem group of mines are winning new honors for the productive regions of Canyon creek and are coming to the front as first-class ore-producers. The Milwaukee Mining Co. was so well pleased with the recent developments, they made the final payment on the property a few days ago and took up the bond ten days prior to its expiration. J. J. Smith, manager, has put on an extra force of men and is pushing work with great vigor. In the lower tunnel, which is in 270 feet, a body of six feet high-grade galena is visible. The company is now shipping enough ore to pay all running expenses. A water ditch is being constructed from Bell creek a distance of 1700 feet with a fall of 237 feet, and all arrangements have been made for the immediate erection of a concentrating-mill with a capacity of 40 tons per day. A. M. Esler has obtained an extension of 60 days on his bond on the Bell group of mines on Canyon creek and has recommenced work on the property.

EVOLUTION DISTRICT.—A number of claims along the famous gray copper belt are being developed to great advantage; every gulch boasts of its prominent mines, and every mine on which any amount of work is being done, promises bright rewards to their owners. The West Point group on Rosebud gulch is looking better than ever. In the upper workings on the Nellie lode, Messrs. Horton & Alger are sinking on a chute of ore from which assays have been obtained ranging all the way from 100 to 4000 ounces per ton. They have from 4 to 15 inches of this class of ore and are preparing to ship a carload of it to the works at Omaha.

EAGLE DISTRICT.—A. J. Prichard has a force of men working his placer claim on Tributary gulch at the headwaters of Eagle creek, near the town of Eagle. While in the city this week Mr. Prichard exhibited to a News reporter a number of coarse nuggets worth \$125, which were taken from his claim; they are fine specimens of gulch gold and a good indication of what his ground contains.

NOTES.—The supply of water in Prichard creek proving rather scant at present, the Mother Lode astrakha can only run about half the time, while the Treasure Box astrakha on the ground adjoining has been obliged to suspend operations. Martin Curran, superintendent of the Morning lode on Chloride Hill, reports a big strike of ore being made this week.

MONTANA.

PEARL.—Inter-Mountain, Sept. 14: J. K. Pardee, who is over from Phillipsburg, reports sinking on the Pearl going on steadily.

COMBINATION.—A diamond drill has been purchased for the purpose of thoroughly exploring the property in advance, that they may sooner arrive at a conclusion relative to increasing their mill capacity by adding 10 stamps.

RUBY.—The syndicate which had a bond upon the Ruby mine in the Lowlands, having given it up, the owners now intend to work the property. They say they have \$150,000 worth of ore in sight and are not at all in doubt as to having a big thing. The

only ore we believe that was ever shipped from the property was some 12 tons last winter, which was taken to the sampling works and netted them something like \$2000.

VOLUNTEER.—The directors of the Volunteer yesterday ordered work to commence at once in sinking the shaft 100 feet deeper, giving a total depth of 300 feet. This work will require about 40 days for its completion, it is expected. The ore in the face of the west drift is about the same in width as at last report—three or four feet. There is a streak in this about 10 inches wide which runs from 30 to 60 ounces. The remainder is a little above 20 ounces.

NOTES.—Boulder Age, Sept. 12: The Amazon smelter resumed work last week with a small force of men. J. F. Smith, who owns the Josephine mine near the head of Galena gulch, has bonded that property to Butte parties for \$20,000. The concentrator at the Evening Star mine is moving along steadily. The machinery is being hauled to the ground and the work of putting it in place begins this week. Uncle Ben Mason has had men at work on the Virginia Bell and its extension for some time, and Monday they struck a fine body of ore just where the two claims join. Tom Harper is pushing the development work on his properties, the Buckeye and Boston lodes, in the Cataract district, and is determined to see what is in them. He has shafts down 20, 25 and 45 feet, and has a force of men constantly at work sinking deeper. Mr. George Spencer is working on his mine, the Wilbur, three or four miles north of Boulder, and has a very promising outlook. He is down about 50 feet and is getting out a considerable amount of fine-looking galena and carbonate ore which will certainly pay.

NEW MEXICO.

FLEMING.—Southwest Sentinel, Sept. 11: The concentrators on the Pauline report the late strike as improving in quality and quantity as depth is gained.

BULLARD'S PEAK.—Mr. Milton Miller reports a new strike on the Alhambra, made on the second level, 200 feet from the main shaft. The ore is of the same character as that formerly shipped from this mine, which yielded from \$1500 to \$8000 per ton in silver.

CHLORIDE.—The carbonate in Chloride Flat is meeting with the expectations of the most sanguine of its owners. A new strike has been made against the porphyry dyke. As yet the extent of the strike is not known, but indications lead to the belief that it will, on development, prove to be of no slight importance.

PIÑOS ALTOS.—The Mountain Key mill is running nights, days and Sundays on ores from the "Key," and has at present a bountiful supply of water. Work is soon to be resumed on the Night Bird. The ore is free-milling. The mines throughout the district are looking well, and the amount of ore on the dumps awaiting treatment closely approximates 2000 tons. The Smith & Ailman five stamps are on full time, and are running principally on custom ore. The Deep Down, near the head of the Atlantic gulch, is rapidly winning a front place as the model mill of the Southwest. The El Dorado group, under the management of Osborne & Co., is one of the steady, never-varying producers of the camp. The labor of three men yields at the rate of 18 tons per month, and the value of the product is a trifle less than \$60 per ton. The Thunderbolt at 55 feet is improving as depth is gained, and it is not at all improbable that this little venture of the Carter boys will net them handsome returns on their investment. The Wagner mill is pounding day and night on ores from the celebrated Atlantic, and hence "Peter the irrepressible" is happy, inasmuch as the yield per ton closely approximates two ounces, which, together with the concentrates, makes a round value of \$60 per ton. The Golden Crown is on the southwest slope of Whisky creek. The shaft is now 90 feet in depth, and copper pyrites is rapidly displacing the zinc, oxides and blends, so common near the surface. The ore assays well and the crevice, as now exposed, indicates great strength and continuity. The Mohawk, under the management of Erich, Haskell & Co., is producing a fine quantity of ore. The arastras will soon be started up, and the product of the mine will be reduced by this primitive method, owing to the fact that the mills are crowded to their full capacity with custom ores. The mills are running on full time, and as we go to press 45 of the 50 stamps are running night and day. The present week Bell & Stevens are running ten stamps on ores from the Golden Giant, now among the most prominent mines by reason of its productiveness, in the district. A big strike was made in the Pacific last week. A drift was run at a point 100 feet below the old workings, striking a vein between four and six feet wide. The ore assays \$40 to \$45 per ton, but will certainly run at least \$25 per ton. A large chunk, weighing about 1500 pounds, was brought to town and is on exhibition at the Tremont House.

OREGON.

OLD MONUMENTAL SOLD.—Bedrock Democrat, Sept. 10: The parties from London, Messrs. Mitchell and Bowick, the representatives of the syndicate upon whom devolved the examination of the property and to reject or approve the terms of sale, visited the Monumental mine and mill and returned to the city. Yesterday they were met in this city by Messrs. C. A. Alisky and C. S. Miller, and papers were made out by which the London Company, through their agents, Messrs. Mitchell and Bowick, became the owners of the property. The Monumental has had a history similar to many mining enterprises that have been inaugurated on the Pacific Coast. Discovered in 1873, the property was developed to some extent by parties who were lacking in means, but finally passed into the hands of Portland parties. A company was incorporated and development work pushed, and the prospects were so satisfactory that in the year 1875 a first-class milling plant of 20 stamps was erected. A merchandise store, boarding-house and other business houses were started at the mine, and for a year or so the camp had a genuine boom. Finally the collapse came for some reason and operations were entirely suspended. From that time until now the mine and mill have remained idle, and the owners have been hoping against hope for some good fortune to come to bring the enterprise to the front once more. The sale of the property at this time be-

tokens a renewal of operations on the Monumental on a more extensive scale than ever before attempted, and bids fair to create a new interest in the mines of that section of which there are numerous good-paying properties if properly handled. Messrs. Mitchell and Bowick yesterday made extensive purchases of supplies for the mine, and will in a day or so send out a force of miners to commence operations at once.

GRANITE CREEK.—Extract from a letter to the Pendleton Tribune. The writer has just returned from the Granite creek mines: "We were taken up almost to the top of the mountain to the richest mine of them all. It is called the Conqueror, and is the property of Backman & Cleaver. Rock ore is being taken out now that will mill not less than \$100, and as high as \$400 to \$500 per ton. This gold differs some from usually found in these regions; it is what they call 'Wire Gold,' a sample of which is in the possession of J. H. Robbins in the treasurer's office, also the rock from which it was taken. They can be seen at their mines, or the desired information can be gleaned from Mr. Robbins or C. J. Carlson in Pendleton, or corresponding with the owners of the mines. I am satisfied if a company with a capital of \$5000 to \$10,000 can be formed, these claims can be developed to an enormous extent. All of the mines, with the exception of the Conqueror, are low-grade ore, and with the cost of transporting the rock from the mine to the mill for reduction, with cost of milling added, and with the limited facilities and capital they have for carrying out this plan, the profits thereof are small, if any. The idea is to remove the engine from the mill and introduce a turbine water-wheel, thereby saving all of 50 per cent of the cost of reducing the ore and saving the gold also. The Conqueror was found after the afore-mentioned claims had been developed, without any flattering prospects, and is, without an exception, the richest in gold I ever saw. If Mr. Cleaver is correct, the Conqueror is the mother-lode of them all, and will one of these days be known all over the coast."

CRACKER CREEK.—Bedrock Democrat, Sept. 10: J. C. Young returned to the Cracker creek mines yesterday to resume operations on the Eagle mine. He took out with him a quantity of supplies sufficient to run his force for some time. Work will be pushed vigorously and it is expected that the owners will be enabled to commence shipping ore to Salt Lake for reduction in a couple of weeks. The ore already on the dump yields assays warranting transportation.

CRACKER CREEK MINES.—A correspondent of the Oregonian writing from the Cracker creek mines of Oregon says: The formation is principally of quartzite intersected with porphyry, with apparent surface condition favorable to rich and permanent ore deposits, and a thorough inspection of the Columbia and other mines now in process of development, but confirms former reports of the merits of this mineral region. Over the divide from Cracker creek lies the late discovered district of Rock creek, extension of the Cracker creek belt. In this most promising region, yet in its infancy of development, I visited a large number of prospects in process of development, among which one in particular, the Forest City, deserves special mention by reason of its rich and well defined showing and other characteristic features. The claim was discovered and located by J. P. Malarkey, and the manner in which it is being developed reflects credit upon that thorough and efficient mining man. The Forest City has two distinct and well-defined veins crossing at the surface with well-defined walls of quartzite and porphyry, and contain exceedingly rich ore, predominating in gold, of which an assay has been returned by J. F. Cresmon, assayer of Baker City, yielding \$10,729 per ton. A contract was let by Mr. Malarkey, and men are now at work in excavation, with the calculation of cutting the veins at a depth of 200 and 300 feet.

UTAH.

WOODSIDE.—Park Record, Sept. 15: A visit to the Woodside property where the leasers are working reveals a scene of considerable activity. The new find has been gone down on a distance of about 20 feet from the surface and a large area excavated for piling the ore on. The vein has widened out to about six feet, all in rich carbonates and chlorides. Indeed the vein looks better as depth is attained and the foot and hanging walls present every indication of permanency. The vein above and below the main workings has been stripped but very little yet, but there is ore in the grassroots all around. The excavations some distance above the discovery show the formation there to be somewhat broken up; that the vein pitches in an opposite direction to the mother vein, which is undoubtedly a true fissure one, as it runs east and west with a northwest dip like the great system of parallel veins in the district. This strike is a rich one and it is genuine. Assays of the ore run from 70 to 600 odd ounces silver to the ton, with a fair percentage of lead.

THE ONTARIO'S TUNNEL.—The Ontario's three-mile drain-tunnel from the east is in about 100 feet; so far the work having been done with hand-drills in hard rock. The fram-work of the large building, which will cover the boiler, compressor and other machinery, was raised Thursday, and the carpenters are rushing it to completion.

WASHINGTON.

FIRST ORE SHIPMENT.—Ellensburg Capital, Sept. 13: Sixteen thousand pounds of ore was recently shipped from the La Una mine at Conconully by T. L. Nixon, the owner, to San Francisco. He had extra heavy sacks made in order to retain the dust which shakes out of the ore so easily, and did everything to retain all the richest of the ore, but the parties who hauled it, instead of packing it in hay as directed, hauled it in open wagons and the sacks were worn full of holes by the time they reached the boat. When it was shipped at Ellensburg on the cars it had lost nearly a ton, and by the time it reached San Francisco it only weighed a little over 12,000 pounds, nearly two tons of the very richest of the dust having been lost through the holes in the sacks. The remainder, however, ran 138 ounces. Mr. Nixon had some of the dust similar to that lost assayed and it ran 589 ounces, and if the ore had been shipped without any loss it would have run about \$250 per ton. A fine showing for a new mine.

THE ROLLER ORE FEEDER

(Patented May 28, 1882.)

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

H. H. H. HORSE LINIMENT.
THE H. H. H. Horse Liniment puts new life into the Antiquated Horse. For the last 14 years the H. H. H. Horse Liniment has been the leading remedy among Farmers and Stockmen for the cure of Sprains, Bruises, Stiff Joints, Spavins, Windgalls, Sore Shoulders, etc., and for Family Use is without an equal for Rheumatism, Neuralgia, Aches, Pains, Bruises, Cuts and Sprains of all characters. The H. H. H. Liniment has many imitations, and we caution the Public to see that the Trade Mark "H. H. H." is on every Bottle before purchasing. For sale everywhere for 50 cents and \$1.00 per Bottle.

For Sale by all Druggists.

Books on Working Ores.

By GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1880.

This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and examined full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, \$3, coin, postage free. Sold by Dewey & Co., Publishers, 252 Market St., San Francisco, Cal.

By C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, \$3. Sold by DEWEY & CO., S. F.

JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 FREMONT STREET, SAN FRANCISCO, CAL.

"HENDY" IMPROVED "CHALLENGE" ORE FEEDER.

The best form of Feeder ever devised, and pronounced by reputable mining men to be far superior to any form of "Roller" Feeder manufactured. We refer to the following gentlemen who have furnished us with testimonial letters to the

above effect, which can be seen at our office, viz.:

N. W. CROCKER, Supt. Bunker Hill Gold Mining Co., Amador City, Cal. D. C. WICKHAM, Taylor Mine, Greenwood, Cal.
J. R. TREGLOAN, Supt. South Spring Hill Gold Mining Co., Amador City, Cal.
W. G. ROBERTS, Greenwood, El Dorado Co., Cal.

WE ARE MANUFACTURERS OF THE

"CHALLENGE," "STANFORD," "TULLOCK," & "ROLLER" FEEDERS,
And will furnish descriptive Catalogues and quote prices upon application.

IMPROVED FORM OF HYDRAULIC GIANTS.

THE ABOVE CUT ILLUSTRATES THE IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS which we manufacture. We guarantee purchasers of this form of Giants against all costs, expenses or damages which may arise from any adverse suits or actions at law. We are further prepared to furnish Single-Jointed Giants when required. Prices, discounts and Catalogues of our specialties of Hydraulic Mining Machinery sent on application.

JOSHUA HENDY MACHINE WORKS, 39 to 51 Fremont St., San Francisco.

HOSKIN'S

IMPROVED

ONE-JOINTED

HYDRAULIC MACHINE.

The statement of Mr. Joshua Hendy that ANY STYLE of machine is an infringement on any style manufactured by him, he knows to be absolutely false. The Supreme Court of the United States on March 19th decided that the pretended patent for infringing, which he has for years been fleeing miners for royalty, is absolutely void, with costs of suit to Hendy & Fisher. I am the inventor of all styles in use, and am prepared to fill orders to suit customers. Send for list of prices of Hydraulic Machinery. R. HOSKIN, Empire Foundry, Marysville, Cal.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and
high heads are utilized, and are guaranteed to give more power with less water than
any other wheel made. Being placed on horizontal shaft, the power is transmitted
direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in
capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the
ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost,
by applying to the manufacturers.

Arizona's Fifth Industrial Exposition.

We are in receipt of a circular of the above-named exposition, from which we learn that the officers of the Fifth Annual Fair of the Arizona Industrial Exposition Association have determined to give greater prominence to the mineral department of the fair this year than ever before, and they invite every mining man in Arizona, whether owner or prospector, to units with them in getting up one of the best mineral exhibits that has ever been made on the Pacific Coast.

The premiums for minerals this year are nearly double those offered for the past three years; but mineral cabinets owned by citizens of Phoenix will not be allowed to compete for premiums this year.

All specimens sent for exhibition will be numbered properly to agree with a full description of the mine, setting forth the character of the ore, formation, development-work, averages assays, etc., which will be in a large book that will be open to inspection for all visitors. All valuable specimens will be safely kept in cases and receipts given for the same.

There will be a permanent exhibit hall in Phoenix, where mineral specimens as well as agricultural and horticultural products will be placed on exhibition. When this fair is closed all who are willing are invited to leave their mineral specimens for display in the permanent exhibit building.

Not simply the owners of developed and large mines, but all other owners, including prospectors and chloriders, are greatly interested in making a good mineral exhibit at this fair and permanent exhibit hall. If capital is attracted to our developed mines, our undeveloped properties will soon be sought after and sales secured of such as have merit.

Special efforts are being made to advertise the agricultural and horticultural resources of Arizona, hoping to induce capitalists to invest and immigrants to make their homes in this Territory. Thousands of strangers from the Eastern and Pacific Coast States will be present at the fair and during the winter months, as plans are now being perfected to secure two or three excursions from California during this fair, and several large excursions each month from the Eastern States.

Mr. G. W. Ingals, formerly agent of the MINING AND SCIENTIFIC PRESS in Arizona, is superintendent of the mining department of the exposition.

Wooden Pipe Manufacture in Olympia, W. T.

One of our correspondents was recently much interested in examining at Olympia, W. T., the process of manufacturing wooden pipe. It is one of few such institutions on this coast. It is known as the Puget Sound Pipe Co. The pipe is manufactured from logs approximating in diameter the size of pipe desired. These logs are turned down smooth and then bored out, after which they are covered with a coat of coal tar and are fitted to be fastened end to end with bands of iron. The advantages claimed for this kind of pipe are that it is better for cold countries, where water freezes and pipes break, a more inflexible style, and keeps cleaner than iron or terra-cotta, because there is no adhesion of deleterious matter to the inner surface. The factory employs about 10 men, and is now shipping pipe to Seattle, Sumner and Ellensburg, W. T., Arlington, Or., and great quantities to Salt Lake City, U. T., where it has been used for many years. At Palouse City, W. T., the pipe has been known to have been down for 22 years, and is still in good condition. O. Z. Mason is superintendent of the company manufacturing the pipe.

Allen & Harkness have one of the oldest established sawmills in the Territory at Olympia. It is not so extensive as some of the newer mills, but employs 10 to 12 men and turns out 10,000 feet of lumber per day.

The adjoining sash and door factory of Springer, Whits & Co. completes the list of factories of any note at Olympia. Here 12 to 15 men are given steady employment, while all of the proprietors are practical workmen and overseers.

THE U. S. Fish Commissioners, John G. Woodbury and Livingstone Stone, have decided to establish a fish hatchery at Sissions. It will be located about one mile from town and water is to be supplied from Big Spring creek.

List of U. S. Patents for Pacific Coast Inventors.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SHIFTER FOR GANG EDGERS.—Frederick W. Cook, S. F. No. 389,443. Dated Sept. 11, 1888. This invention, as its name implies, relates to a means for shifting or moving the saws of a gang edger on their shaft, in order to vary their position according to the work required. The invention consists in a shaft or rod passing through a bearing in the saw-collar and provided with a pinion on each end which engages a fixed rack on each side. The object of this construction is to move the saws by a connection with the hub or collar thereon, and to apply the power, to move them, to both ends of the adjusting shaft or rod, whereby the adjustment is effected easily and with precision.

BOAT-DAVIT ATTACHMENT.—Chas. F. Rodin, S. F., assignor of one half to P. C. Rice of Enreka, Cal. No. 389,410. Dated Sept. 11, 1888. The object of this invention is to provide such a davit attachment as will operate automatically, to instantly and simultaneously release both ends of the boat the moment either end finds support in the water. This is accomplished by a simple but ingenious arrangement of books and triggers, the triggers being connected so that when one is tripped, the other will be instantly released also. The tripping of either trigger is effected the moment that end of the boat finds support in the water, and is accomplished by means of a spring-actuated attachment with the hook which engages the trigger, and this attachment furthermore provides for drawing up the hook and tackle out of the way the moment the release is effected, so that there will be no danger of interference or catching of the hooks under the boat-rail and capsize her.

ORE FEEDER.—James C. Gibson, S. F. No. 389,456. Dated Sept. 11, 1888. This is an improved machine for feeding ore to crushing or stamp mills. Its essential parts are a hopper, an intermittently rotating hollow cone or cylinder receiving the ore from the hopper, and a spirally arranged or inclined scraper within the cone or cylinder. The cone or cylinder is given its motion by a suitable clutch mechanism operated by a system of levers set in operation by the stamp stem, or otherwise connected with the machine to which the ore is to be fed. The ore passes out from the throat of the hopper, into the upper and smaller end of the hollow cone or cylinder, the intermittent rotation of which carries it against the inclined scraper near its outer end, by which it is gradually worked out and discharged into the battery or crushing-mill. A peculiar adjustable spring holds the scraper while in position, while the whole machine is simple in its construction and effective in its operation.

STATION INDICATOR.—John Knight, S. F., assignor of one-half to the Pacific Indicator Company, same place. No. 388,980. Dated Sept. 4, 1888. This invention relates to that part of the indicating mechanism of this class that is commonly known as the "box." Station indicators are devices for automatically exhibiting the name of station or street to which the car is approaching so as to give notice to the passengers. The general mechanism is divided into two parts, viz., the box or device by which the names of the streets or stations are exhibited and the mechanism by which power is transmitted to the ribbon or endless belt in the box. The invention of Mr. Knight consists of an improvement in the box, the arrangement of the traveling indicating ribbon and the arrangement of the driving mechanism by which the ribbon is given motion. The ribbon winds in a tortuous course over an upper and a lower drum, and is driven by an independent roller which it almost completely encircles. This independent roller is the essence of the invention and provides for driving the ribbon independently of the main drums or rollers, so that it is kept taut in both directions.

P. AND B. PAINTS AND COMPOUNDS.—Among our new advertisements to-day will be found the card of the Paraffine Paint Company, which manufactures a line of paints, roofing and other material. The paint manufactured by this company is largely used for iron work and roofing, and is especially valuable for wood or iron which is exposed to acid fumes of any kind. It is also used for waterproofing cloth, paper, or leather. Boards or timber of any kind exposed constantly to water or alternating wet and dry are preserved by this paint almost indefinitely. See advertisement.

NATIONAL IRON WORKS.—We are glad to learn that the proprietors of these works, Messrs. Marchultz & Cantrell, are busily engaged on plans for a new and substantial brick machine-shop and foundry to be erected on the site of their old works. Meanwhile they have secured temporary quarters at 13 and 15 Spear street, where they will execute orders with their usual promptness.

THE loss by the late flood in Georgia is estimated at \$1,000,000. No estimate can be made of the damage to farms and crops from Augusta to Savannah, while the country along the river is submerged. Eleven persons have been drowned.

CAPTAINS of steamers plying to the Cascades report tremendous forest fires raging in the mountains on both sides of the Columbia river.

Mining Share Market.

Of the mining share market not much can be said other than has in this column been said over and over during the past six months. Nothing can be more monotonous than the proceeding had in the Stock Exchange as repeated day after day. The dullness has become chronic—has etaying qualities not expected of it. What this condition of things denotes, if it presage anything special, no one can tell or even guess. All are at sea, some predicting better times at hand, while more despair of any early improvement in the market.

A Zinc Mine in Nevada.

We have reports of what is thought to be a very valuable deposit of zinc in the State of Nevada, located at a point about 22 miles north of Eureka, on the line of the Eureka & Palisade railroad. The area which is covered by the deposit, so far as explored, is said to be 1500 feet in length by 100 in width. The Examiner of this city gives the following particulars as reported by Ex-Congressman Wren of Nevada:

The earth is perfectly impregnated with it, and in one instance where a tunnel was cut 60 feet, finding the deposit everywhere, the roof of the tunnel shone like a palace of crystal from the sulphate oozing and forming stalactites.

Beside the zinc there seem also to be deposits of gold, silver and lead; but the zinc is by far the most important discovery, if it can be turned out as it is believed it can be.

The main idea of the people there is to manufacture zinc-white, which is worth about \$250 a ton. The great difficulty which this manufacture has encountered is the high price of the carbonate of soda which is necessary in its manufacture.

It so happens in this case that Nature has treated the district with as much favor as she did the silver districts when salt deposits were found near them. All around the zinc district are immense deposits of carbonate of soda that can be taken for next to nothing in cost.

Carbonate of soda will precipitate sulphate of zinc from its solution, and from this zinc-white is manufactured. Heretofore this costly preparation came solely from France.

Should it so occur that something unexpected would turn up and prevent the white-zinc manufacture, the sulphate of zinc itself remains and is of greater value than many would estimate for medicinal purposes. As it stands now, the druggists of the world must make their own sulphate of zinc, and they are obliged to depend on pure metallic zinc at the rate of ten cents a pound for their manufacture.

A NEW PAPER BINDER—A. T. Dewey's patent elastic binder, for periodicals, music and other printed sheets, is the bandiest, and very cheapest of all economical and practical file binders. Newspapers are quickly placed in it (as received) and held neatly, as in a cloth-bound book. It is durable, and so simple a child can use it. Price (size of this paper, Harper's Weekly, and Scientific American), 75 cents; postage 10 cents. Postpaid to purchasers of this paper, 50 cents. For sale at this office. Send for illustrated circular. Agents wanted.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

REMEMBER.—We can make it an object for some friend desiring first-class passage at a low rate to the East to consult us before buying tickets.

ATTENTION, MILLWRIGHTS!

A BOOK YOU ALL WANT.

Leffel's Construction of Mill Dams and Bookwalter's Millwright and Mechanic.

A STANDARD WORK.

This practical work of 233 pages gives with full illustrations and complete detail how to build or repair all kinds of mill dams. Pains have been taken to thoroughly illustrate dam construction and rudimentary hydraulics. It contains fine cuts of all the well-known dams now in use, with a complete description as to their mode of construction. Mill owners will find this a valuable work of reference. Besides complete directions for building and repairing all kinds of dams, it contains much other valuable information regarding hydraulics, in all its branches. No engineer can afford to be without this handy pocket assistant.

Price 50 cents, postpaid. For sale by DEWEY & CO., 220 Market St., San Francisco, Cal.

"WHEELER PROCESS"

Working Refractory Gold and Silver Ores.

We are now prepared to receive Ore at our Testing and Mining Mill, Meriden, Conn., in sample lots of 500 pounds, to be worked by the Wheeler Process, where we have succeeded in saving 90 per cent of the metal contained in the ore.

We work sample lots free of charge and report results. THE NEW CHEMICAL GOLD MINING CO., Box 939, Meriden, Conn.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3.00 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

Sampling Works for Sale

The works are situated on A. & P. R. R., Calico Mining District, Daggett, Cal., and contain a first-class Engine and Boiler with Ore Crusher and other machinery, Platform Scales, Mill Scales, Assaying Outfit, etc., all nearly new. Also upon the premises an office building and a comfortable dwelling house (portable). The above can be had at a bargain. Apply to GILLESPIE & CHILDS, 123 California street, San Francisco.

J. A. JOHNSON, 307 Montgomery street (the Nevada Bank building) is the general agent of the Stiles quartz machinery, and offers easy terms for introduction.

ASSESSMENT NOTICE.

Lord of Lorn Gold and Silver Mining Company. Location of principal place of business, City and County of San Francisco, California. Location of works, Gold Hill Mining District, State of Nevada.

NOTICE is hereby given, that at a meeting of the Board of Directors of the above-named corporation, held on the sixth day of September, 1888, an assessment (No. 4) of Ten Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, Nos. 13 and 15 Fremont street, San Francisco, California. Any stock upon which this assessment shall remain unpaid on the 12th day of October, 1888, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on Friday, the second day of November, 1888, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors. R. N. VAN BRUNT, Secretary.

Patent Agency.

ESTABLISHED 1863.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us offer to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St. S. F.

HYDRO-CARBON ASSAY FURNACES

THE DOUBLE "ECONOMIC" STAMP MILL.

We have here the Stamp Mill in a cheap and simple form. The high drop of the old stamp is more than compensated for by the great weight (1200 lbs. each) of our stamps, and the rapidity (300 strokes each per minute) with which they run. There are 4 shoes in each stamp, so that there are 4800 strokes of the shoes on the dies per minute. Less power is required than in any other mill to do the same amount of work.

The Mortar has screens at both ends, giving ample discharge. There are no cams or tappets to wear or be adjusted. The stamps adjust themselves as the shoes wear.

AN AUTOMATIC ORE FEEDER

Goes with each Mill. We also have a suitable

Rock Breaker.

Several Mills are now in the mines doing excellent work. The "Economic" is not only a mill for small mines, but we believe it is destined to SUPERSEDE THE OLD STAMP IN MILLS OF THE LARGEST CAPACITY.

TATUM & BOWEN.

34 and 36 FREMONT STREET, SAN FRANCISCO, CAL.
Manufacturers of Mining and Sawmill Machinery, Engines, Boilers, Etc.

THE RAND DRILL COMPANY, 23 Park Place, New York.

We are now so situated with our new works as to offer to the miners of the Pacific Coast SMALL AIR-COMPRESSING PLANTS at prices that almost any small mine can afford to put in power drills if they have none in use.

By our NEW AND PATENTED SYSTEMS (by which the duty or performance of drills is not reduced with use) it is no longer necessary PLANTS IN THIS COUNTRY, and has patterns for all sizes up to 40-inch diameter of cylinder.

In respect to capacity IN SPEED OF DRILLING, perhaps it is in order to say that in EVERY AUTHORITATIVE CONTEST for speed yet initiated, the RAND DRILLS have, without exception, BEEN VICTORIOUS. This fact coupled with another important one, that the drills use much LESS AIR and cause LESS REPAIRS, has won for them nearly all of the Eastern mining trade, which has kept their works always busy.

Since the reasons which formerly restrained us from the California market no longer exist, we are now in the field for the business.

A SPECIAL ATTENTION is called to the latest designed sectional Compressor just built for the Batopilas mine in Mexico, and to the Compound Engine Compressor built for the Anacoda mine in Montana.

ROCK DRILLS
AIR COMPRESSORS &
GENERAL MACHINERY FOR
MINING, TUNNELING,
QUARRY & RAILROAD WORK.
RAND DRILL CO. 23 PARK PLACE NEW YORK

to buy a Compressor of double capacity than the drills are expected to require, in order to keep up the supply of air necessary on account of the wear of drills and compressor.

Besides having THE NEWEST AND LIGHTEST designed small drill plants, the Rand Drill Company, as is well known, has built, and is now building, the LARGEST COMPRESSOR

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; is in successful operation and we guarantee its work as represented.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

FRISBEE-LUCOP MILL COMPANY,

National Mining Institutes.

The project is being discussed in Great Britain of forming an Imperial or National Institute of Mining Engineers, which scheme embraces the federation of all institutes of mining engineers throughout the kingdom. Differences of opinion prevail as to the expediency of the plan. There are already several mining institutes and associations, more or less local in

it is conceded that the membership of such an institute as proposed would be an honor, the influence would be national, and the transactions of great value in mining literature. To mining engineers it would be very useful in many ways.

In this country we have few, if any, local mining institutes of any standing. Efforts have been made to establish them here, though with but little success. The American Institute

A Miners' Club-House.

A social organization known as the "Helping Hand" was organized a few years ago at the New Almaden quicksilver mines, Santa Clara county. The company supplied a building for the club-house, and this is well furnished and arranged for social purposes. Mr. Randol, the manager of the company, conceived the idea of fitting up a comfortable hall,

being fitted with a stage and scenery, so that it is possible for small companies to render plays there.

The Helping Hand Society is almost wholly conducted by the mine management. The "Miners' Fund," by which it is maintained, is made up by monthly contributions of \$1 from each adult employe of the company. The building of the society is shown in the accompanying engraving, which was made direct

THE HELPING-HAND CLUB HOUSE, NEW ALMADEN QUICKSILVER MINE.

character. Some of those in favor of the new institute desire to absorb all the present organizations, and it is this part of the plan that brings many objectors. Some who favor a National Institute still desire to see the local organizations remain as they are. They say that to have only one center, in London, would not confer any benefit on the mining industry or those engaged in it.

The originator of the scheme of the new institute did not desire the dissolution of the present mining institutes, namely, the North of England, the Scotland, the Manchester, the Midland, the Chesterfield, the South Wales, the North Stafford, and the South Stafford. He wanted to see all these continue, to see them preserve their local identity, have their own meetings, papers and discussions, but each subscribe to the federation, which would receive and distribute all the local transactions.

No conclusion has yet been reached, although

of Mining Engineers seems to answer all the purposes required, and it is national in character. Of late years very many valuable professional papers have been read, and the influence of the Institute has greatly increased.

Plenty of flour, potatoes and bacon stored in the cellar, a good supply of all other necessary eatables, a warm cabin, plenty of firewood and a good healthy prospect to keep him busy, and the prospector is equipped for the winter.

The mines in the Sweet Grass hills, Montana, are attracting the attention of all the old placer miners in that Territory. Rich quartz is being discovered and by another year this is expected to be an important mining district.

The first shipment of borate of lime from the Lone ranch, Curry county, Oregon, has been received. The deposit is half a mile long, 200 yards wide, and quite deep.

with reading-room and kitchen attached, and this was carried out successfully. All who pay \$1 a month to the "Miners' Fund" are entitled to the privileges and can come to the hall when open, play games, read, or take a cup of tea, chocolate or coffee, with cake. No gambling or drinking of spirituous liquors is allowed. Smoking is permitted in the main hall, also games, and in the reading room no smoking or talking is allowed. There is a good library, and all the magazines and daily and weekly papers are kept on file.

The attendance is good, the rooms being very generally frequented in the evenings. There is a cook-room where light refreshments are served at moderate cost. Entertainments of various kinds are given in the hall. Most of the amusements are arranged by the residents and are free. There are sometimes dramatic entertainments given by outsiders at which an admission is charged, the main hall or auditorium

from a photograph taken by Mr. Bulmore, one of the officers of the mine, who is a skillful amateur photographer.

The British mining machinery manufacturers are looking hopefully toward Siberia as a new source of trade. The alluvial and glacial deposits contain a rich percentage of gold derived from the trituration of the clay-slates and through quartz veins. Gold dust is found in almost all the Alpine ranges fringing the great plateau; but the chief gold-mining ranges are in the Altai and the Olekma region. Gold is also found on the high plateau in the basin of the Upper Vitim, on the lower plateau in the Nertschinsk district, and on the upper tributaries of the Amur, especially the Oldi and the Trega, in the northeast continuation of the Nertschinsk mountains. It has been discovered also on the Bureya range and on its northeast continuation with the Amguu region.

CORRESPONDENCE.

We admit, unadvised, opinions of correspondents.—EDS.

Five People Killed by an Explosion of a Freight Engine.

MANSFIELD, Ohio, Sept. 14.—The Baltimore & Ohio freight engine exploded at Ankenytown this morning while the passenger train was passing, killing five persons.

EDITORS PRESS:—Such casualties as the above are too frequent; by rail, at sea, on the river and ashore. Scarce a day goes by but some explosion occurs. In some cases the engineer and fireman alone go with the boiler, but seldom, as in the above instance, the passengers on another train were included in the loss.

The natural and first inquiry is as to the cause. Prolonged examination and investigation usually fail to reveal all the causes. Among them, one always present is improper handling of the boiler. Sometimes the exigencies of the service will not permit the time for cleaning and repairs necessary. From a business standpoint the boiler is run for all there is in it, the argument being—boilers must wear out, will burn out, we expect it, better economy to burn her up, get what we can out of her and replace with another than to keep a relay or spare engine for use while the regular is laid off for a day, once each 10 or 15 days for cleaning and close examination.

It would seem to be apparent that if a boiler will stand a given pressure when new, it would stand about the same strain if its integrity were preserved by repairing or replacing parts weakened by wear, for an indefinite time. There are cases where boilers are not opened in years; the owners recognize the fact that they are using more coal than formerly, but do not know why! There are locomotive boilers that finally refuse to do their work and are reluctantly sent to the shop for general repairs. The old tubes are taken out, put in a lathe, the scale turned off or chipped off with hammers, and replaced after this shell has been, as it is called, "scaled," or new tubes put in. The marine boiler being larger, admits of men going into it with the old-time "scalin" bar and "scalin" hammer, and that is, after many hours and much labor, cleaned, ready for a new trip and same work at its end.

While this scale is forming the damage to the iron is progressing for the first few days but little, but as scale increases in thickness, so increases the damage to iron by greater heating, which in time crystallizes the iron, reducing its cohesive and tensile strength.

Yet another result of scale and a very important one to owners is found in greater consumption of fuel. One-sixteenth inch of scale is very little, yet it has been proved beyond possible dispute by scientific men that it means 15 per cent waste of fuel, increasing in waste rapidly as scale increases in thickness. Many men who handle boilers deny this, because their conditions will not allow them to prove it. To obtain such proof requires so much close calculation that it is very difficult. But science has done it, and it is known, and cannot be successfully contradicted.

Men of the longest experience in handling steam-power recognize the evil and have for years sought a remedy. Thousands of dollars have been spent by them on mechanical devices with but little avail. Some of these mechanical propositions have proved palliatives, but none cures. The salts in the water causing this trouble are soluble in cold water and cannot be eliminated save by evaporation; filtration cannot, does not do it. High heat transforms them into insoluble matter, which is suspended in the water in mineral form and gradually settles upon and attaches to the iron; this leaves it to the action of chemical agents, which have the power or property of decomposing those salts, leaving them in the boiler in separate particles, which will settle to the bottom of the boiler in form of mud, when they (or it) can easily be washed or brushed out, leaving the iron clean.

A boy's experiment will prove the damage from scale: Take a tin kettle, partly fill with cement, set on stove. How long will it last, even though water is in it? Same kettle filled with water. How long will it last? The questions suggest their own answers, and at same time illustrate *Scale in Boilers*.

I. W. KINNEY.

From Calaveras County.

EDITORS PRESS:—Senator Dorsey visited his mines on the Stanislaus the past week with a view of opening them up. Prominent among his group is the "Snell." The ore of this mine gave by assay process \$55 to the ton. The Senator put down a shaft 125 feet and drifted the same length. The shoot, which was but 20 feet long, widened out to 125 feet at the bottom of the shaft, as shown by levels run. In all of the mines no timbers or powder was required, the quartz being easy to pick and the walls firm enough to require no timbering. At 100 feet a sample of the vein was taken and worked in San Francisco, which gave \$112 to the ton. Uncle Tom Goodwin came in this week with a sack of ore from a new strike on the Stanislaus; ore is exceedingly rich in high-grade sulphurets; vein four feet wide. Two mines in this vicinity have opened up very rich, but the owners, for the present, want the names of the mines kept

quiet. At Carson, the English company that bought the Stewart mines are preparing to work on an extensive scale, their first work being the construction of a ditch from the Stanislaus, at an estimated cost of \$75,000. Once this property gets under way it will operate the largest plant in the State. At Angels all is bustle and booming. The mines are now down 400 feet with the character and size of the veins steadily increasing. Angels is now an assured success.

E. A. SCHAEFFLE.

Murphy, Sept. 10, 1888.

To Mining Men.

Major Frank McLaughlin, who lately returned from Europe, where he succeeded in placing the Golden Gate mining property on the English market, says English investors are exceedingly cautious and very about American investments. He says that English people will not look at, or examine, a mine unless the title is perfect. The only title they consider perfect is a U. S. patent, and the major thinks it should be the first duty of every man who expects to place a mine on the English or any other market to secure a clear and perfect title at once. The facilities for even the poorest man in America are ample to obtain a Government patent at a trifling cost.

The second duty of a mining man who wishes to induce capitalists to take hold of mining property, is in handing his mine to fix a selling price and hold the vender strictly to this. One reason why so few mines are sold is, that the middleman place such exorbitant and fictitious values upon the property. In one instance a mine on this coast was bonded for \$10,000 and placed on the English market for a million and a half.

The leading hotels of London are filled with American speculators—many of them mere adventurers—trying to dispose of American mines to English companies. So many capitalists have been swindled that they fight shy of any man who mentions mines. The ordinary letters of introduction are useless, while a man would have to spend five or six years of his life in personally getting acquainted with people there and inducing them to take hold of mines in this country. He thinks the original owners in handing should fix a moderate and reasonable price—one that would be really justified by the mine itself, and hold the middleman or speculator to this. Then capitalists would regain their confidence and be more willing to invest.

Major McLaughlin found by conversing with leading financiers that only a limited number of people in England make investments in the way of speculation. In fact, out of the many millions, less than 450,000 English people make investments in mines, railroads, canals, etc. These all run in grooves; thus the railroad men invest simply in railroads, the mining class in mines, the canal men in canals, and so on throughout the list.

When the major reached London he was told by some of the leading moneyed men of that city: "The best thing you can do is to fold up your papers, put them away in your trunk, and have a good visit for a month and return without trying to induce men to invest, for no one is able to put mines on the market at present." It was nearly a fact, too, for the Golden Gate was the only American mine placed on the English market for three months. At the conclusion of his trip, he spent a week in Paris for a rest, took a run then up into Scotland and went to see the famous gold mine of Wales.

In speaking of mines, Major McLaughlin says the *Financial News*, edited by Mr. Harry Marks, for a long time connected with the *New York Herald*, is the leading financial paper in London. It is looked upon as a great authority in mining matters for the proprietors to investigate the title and value of mines very carefully. An indorsement from that paper is almost a certain guarantee of success. A newly organized company for investigating the title and worth of mining property is called the Mining Investment Company. This company is intended to put an end to some of the swindles that in the past have taken place. The major tells us that Ireland, contrary to general ideas, is one of the richest of countries, so far as capital is concerned. The savings banks of all Ireland are overflowing with money, but capitalists do not like to make investments away from home. They prefer canals, street cars, railroads and other home investments.—*Oroville Register*.

AN AMERICAN MINING ENGINEER APPRECIATED.—The Shah of Persia has requested Chas. A. Ashburner of the United States Geological Survey to take charge of the Persian engineering corps. The Shah is of the opinion that valuable deposits of coal, iron, petroleum and perhaps the precious metals are to be found in Persia. Hitherto nothing but turquoise has been mined in that country. Mr. Ashburner is now stationed at Pittsburgh, Pa. He has not yet made his decision regarding the Shah's proposition. Mr. Ashburner is a young man of great ability as a mining engineer and geologist, and organized the survey of the anthracite fields for the Geological Survey of Pennsylvania. He is too valuable a man to be let go to this far-away portion of the globe, and we sincerely hope his decision will be to remain at home, where there is just as large a field for his talents as there is any place else in the world.

Regarding Changes of Situations by Mechanics.

There is a quite prevalent idea that a mechanic who changes from one position or shop to another frequently necessarily has something in his constitution or make-up which renders him unfit to be depended upon; and there are many who utterly refuse to believe that such a man can be either a good mechanic or possessed of any ability of whatever kind. It must be acknowledged that mechanics are often met with who seem to hear out this opinion; but, on the other hand, every one who has been associated with mechanics to any great extent must know plenty of them who have made many and frequent changes, in some cases extending through a number of years, and have finally found a place in which they were eminently successful, probably more so than they could by any possibility have become in any of their previous positions, if, indeed, their final success was not due, in a great measure, to the changes preceding it.

It is, of course, true that many and frequent changes by a workman are often caused by a fickle or discontented disposition, and often also by the fact that the person concerned has a much greater ability in obtaining situations than in keeping them after he has obtained them. But because some mechanics make frequent changes for such reasons, by no means justifies the universal condemnation of every one who is given to changing about.

It should always be remembered that there are many good reasons for making changes which are liable to present themselves to any mechanic at any time; and that it is as illogical and foolish for a mechanic to disregard or ignore such reasons simply from a general indisposition to change, or dread of leaving old associations and friends, as it is for any one else to decline to take a given course when good and sufficient reasons for so doing present themselves.

There are, of course, certain disadvantages which usually accompany a change of location, but it should not be forgotten that there are also certain advantages often to be gained by such changes, and that, other things being equal, the person most interested is best qualified to weigh, compare and decide which course to pursue; and that often there are reasons for changing which present themselves to him very forcibly, but which, from their nature, cannot be known or understood by others.

Most young men especially are benefited by moving about considerably. It is comparatively easy for a young man to adapt himself to new conditions and to take hold of work differing in its nature from that to which he has been accustomed, and the ability to do this, acquired during the period of life when it is easy to acquire it, is apt to be a decided advantage in more mature years.

Who has not seen men grown old in the service of some employer with whom they have learned their trade, perhaps, and have never worked elsewhere, and who are really in a pitiful situation of dependent helplessness? Being almost totally unacquainted with methods of doing work outside of the shop in which they have been trained, and not having acquired while young that facility for adapting themselves to new conditions which it is seldom possible to acquire during the years of mature life, they painfully feel their helplessness and dependence; and there are too many employers who do not hesitate to take advantage of it. Then, too, in judging of the conduct of employers in these matters it should be remembered that the same causes which have made the workman dependent upon him have also usually made the workman less valuable to the employer.

In almost every shop there are men to be met with who would probably be greatly benefited and developed by changing about a little, widening their horizon, and extending their acquaintance with other mechanics and their way of doing things.

The old proverb is true enough, "A rolling stone gathers no moss;" but it is well to consider that the gathering of moss may not be the only object of the existence of stones, and that, supposing it to be desirable that all stones should gather moss, there are many of them so situated as to make the gathering of it impossible, and not to be hoped for without some preliminary rolling about in order to secure more favorable conditions for moss, gathering.—*Am. Machinist*.

EXOTIC FLAX.—M. J. De Turoh of Lille, France, has brought to light a textile plant of Chinese origin which he calls exotic flax. It is claimed for this material that in its native country its cost is from 1½ cents to 2 cents a pound, and from 2½ to 3 cents a pound laid down at Marseilles, whereas flax costs, according to quality, from 10d. to 1s. 9d. per kilogramme. The exotic flax, without assorting, is fit for the coarsest fabrics or the finest, the latter only requiring the usual more careful and complicated preparation. The finest lace end the strongest cord can be made from it, as well as an infinite variety of intermediate fabrics, such as tablecloths, napkins, carpets, plush, wearing apparel, etc. It is spun without combing, thereby saving 40 per cent of waste incident to flax combing. The material can be worked with the ordinary flax machinery. The textile can be mixed with flax, silk, wool and cotton. Its strength is very great, and a sewing thread can be spun which requires no twisting. The refuse is utilized, and can be worked in the same manner as cotton, which it closely

resembles. If desired, the long fiber can be broken up by an ordinary crusher and reduced to the usual length of cotton fiber. The plant utilized by M. De Turoh is that which produces the Tonquin bean, and next to rice is considered the most important crop of China.

Old Steamboating Days South.

The burning of the magnificent steamer Edward J. Gay, on the Mississippi recently, removed one of the landmarks of the Western steamboat business. She was one of the last of that magnificent fleet of floating palaces that were the pride and admiration of the traveling public. Plying between New Orleans and Vicksburg, Natchez, Memphis, Louisville and St. Louis, they formed for three-quarters of a century the luxurious means of travel which combined all the elements of speed and comfort now to be found on the first-class transatlantic steamers. The wealthy planters were the generous patrons whose princely lavishness of expenditure built up this system. There is nothing now in modern travel comparable to these great steamers except the Hudson river and Long Island sound steamers. The class of patrons, however, differed from the tourist to be found on steamers nowadays. They were known to one another by name or estate, they had their own landings, and the transportation of their enormous crops was the basis of the prosperity of the steamboat business. No one who ever made a trip from New Orleans to Louisville in the palmy days of the Eclipse, the R. E. Lee, the J. M. White, Natchez or the Ed Richardson can ever forget what a delightful experience it was. The social features of it were as charming as they were typical of all that was delightful in Southern life. All this has been changed by the encroachments of the railroad. That phase of travel has disappeared and for it has been substituted slow trains, dirty cars, irregular connections, scant meals and the enforced propinquity of the great unwashed public. A few old pilots, a few uncouth freight-carriers and a few coal-packets are all that is left to tell the tale.

WOOD-PULP MANUFACTURE.—This rapid development of wood-pulp manufacture is an intimation that there is a new industry to which our great forest areas may be, in part, very profitably devoted. For, apparently, it doesn't matter much what species of wood is used in this production of pulp—possibly spruce is preferred in the extreme Northeast quite as much on account of its convenience as for any other reason. At any rate, it is quite certain that poplar, hemlock, cypress, and several other common woods would answer the purposes of the business acceptably; and it is also contended that white pine would do. What may be regarded as a specially attractive feature of this wood pulp industry, from the standpoint of economy, is the fact that it utilizes the waste incident to timber-cutting on a large scale. Only the limbs of the fallen timber are taken, so there is no competition possible with lumber manufacturers, rail splitters, or others having as merely for the bodies of the trees. The only domain treasured upon is that of firewood, more particularly in the corded form; but surely there could be no grievous losses in this direction to the fuel supply. For naturally the demand on behalf of wood-pulp manufacture would center itself where the timber is most abundant and cheapest; and in this way large quantities of felled timber, now left to feed forest fires or decay on the spot, would be turned to profitable account commercially.

RAILROAD CARS IN PROPHECY AND HISTORY is an extraordinary book, in which the author, Rev. D. T. Taylor, presents proofs (?) of the nearing end of the age. The author says: "A railway train moving but a mile a minute dashes over the ground 88 feet every second. This is literally to dart or shoot. Ancient travel was at a snail's pace compared with the speed of the man whose hand controls the engine. This is the chariot of fire! Settle in your hearts, thou, reader, that here is a divine prediction made 2500 years ago in Asiatic lands of the coming of an extraordinary age of travel—travel in great haste; and this infers new methods, new facilities and new powers at the command of man. Are such methods in use? Then the prediction is accomplished, the consummation near." Again: "The discovery of the practical use of steam and electricity was reserved for these closing days of this world's history, when the king's business would require haste." The book reads like the work of one who is sincere, but so chimerical as to be hovering on the border between sanity and insanity.

COLORADO OIL FIELDS.—At the late meeting of the American Association for the Advancement of Science, held at Cleveland, Ohio, Prof. J. S. Newberry gave an interesting talk on "The Oil-Field of Colorado." This oil-field, he said, was situated in the valley of the Arkansas, above Pueblo, about the town of Florence. The oil is of excellent quality, has a green color and an agreeable odor. It yields on distillation 40 per cent of excellent burning fluid and nearly 60 per cent of superior lubricating oil, which contains much more paraffin than the oil of Pennsylvania. The oil-field of the Arkansas valley is extensive and the yield of oil may apparently be increased indefinitely. The source of the oil is undoubtedly the carbonaceous matter of the Colorado black shale, from which it is being spontaneously distilled,

The Russell Process.

Its Practical Application and Economic Results.

(Continued from our last.)

F.—Siphon Pumps (or Ejectors), Solution and Sluicing Pumps.

The siphon pumps, made by A. Aller, 109 Liberty street, New York, are lined with hard lead and have a platinum steam nozzle. Size No. 4, costing \$88, is the most suitable for a 16-foot leaching-tank. In using the siphon pumps for leaching, two precautions are necessary: first, the siphon pump must be upside down (suction up) so that all solution coming from the leaching-tanks, running down the sloping hose, may fall directly into the steam in the ejector. Otherwise, or if the hose has a sag in it, the siphon will act only intermittently, ejecting first steam, then solution, then steam, etc. Secondly, the steam used must be dry, which can only be secured in this case by covering the steam pipes. The difference in effort between wet and dry steam for siphon pumps was illustrated at a mill in Arizona. The steam was conducted about 200 feet in an uncovered 1½ inch pipe. The result was that the siphon pump would not lift six inches, and was therefore useless. It was then used near the boiler, and lifted 20 feet, and forced the solution an additional 20 feet.

In addition to one siphon pump for each leaching-tank, there is also one for returning the clear solution coming from the filter-press to the sump of the solution pump.

If lead is to be precipitated with soda ash, one siphon pump (which should be a No. 6) will also be necessary for each of the three lead precipitating-tanks. A siphon pump is also sometimes necessary in making up the extra solution in one of the storage-tanks; for in case the chemical in the box with perforated bottom should not be dissolved by the time the right volume of solution had run into the storage-tank through that box, some of that solution would have to be forced up and circulated through the chemical-box until the chemicals were dissolved.

The solution pump should be a Knowlss 6½ double plunger, with 8-inch steam cylinder, 5-inch plunger and 12-inch stroke, and a 4-inch suction and discharge. The fire pump for sluicing should be a Knowlss (or corresponding size of other make) single-cap pattern, with 10-inch steam and 5-inch water cylinder, 12-inch stroke and 4-inch suction and discharge.

G.—Apparatus for the Mechanical Treatment of the Sulphides.

This consists of a pressure-tank, Johnson filter press and steam drier. The details, the pressure-tank and steam drier, are shown in Figs. 1 to 3 inclusive. The filter press, "circular pattern," is furnished by John Johnson, Franklin square and Cherry street, New York. The size should be 18 inches, with 24 chambers, 12 two-inch distance-rings, one dummy plate, pressure gauge, indicating as high as 150 pounds, one dozen extra tension-hooks and screws, three sets of "double-chain" filter-cloths, but no pump, pulleys, shafting or hangers. The cost of the above is about \$290 f. o. b., New York. Much trouble has hitherto been encountered in using a pump for forcing sulphide into the filter press, but the pressure-tank gives no trouble. If the pressure-tank and press are arranged as shown in the drawing, very little steam pressure is needed, as most of the sulphides run by gravity into the press. It is likely that compressed air will eventually take the place of steam for this purpose.

If the sulphides are to be dried by steam, the use of the filter press cannot be avoided. Near the front of the steam drier is a small windlass by which the pans of sulphide are lifted into or removed from the steam drier. At the side of the steam drier is the sampling floor and scales. The sampling floor is best made of iron plates, the larger the better, closely jointed.

H.—Miscellaneous.

Experience has shown that a separate steam boiler for the leaching plant is advantageous, even when the regular mill boilers are available. The steam for the leaching plant can thus be maintained at a greater pressure than would be advisable in the regular mill boilers, the filter press, siphon pumps and steam drier doing much better work with high-pressure steam. Moreover, the leaching plant is thus rendered independent of the rest of the plant, and can be run when the mill boilers are shut down.

In the rear of the leaching-tanks is a car-track having a slight inclination, which answers not only for bringing ore from the rest of the mill plant, but also for conveying chemicals from the chemical-room to the leaching-tanks and chemical-boxes if the extra solution is made up on the ore. The car for chemicals runs over the scales in the chemical-room, where the bluestone and hyposulphite are stored. The caustic soda and sulphur are in the upper chemical-room, in which is also a pair of platform scales. In addition to the scales already mentioned, there must be another set for weighing the ore delivered to the leaching-tanks.

If the tailings cannot be sluiced out, owing to scarcity of water, they should be removed by cars running under the leaching-tanks, as shown in the drawing.

The whole building should be well lighted,

particularly over the precipitating-tanks, a skylight being placed in the roof over each of these tanks.

The platform around the leaching-tanks should be about 2½ feet, and that around the precipitating-tanks 4 to 6 inches, below the top of these tanks respectively.

All treatment of the sulphides below the sulphide storage-tank takes place in a room shut off from the rest of the mill.

IV. Expenses. A.—Comparative Values of Chemicals in the United States and Mexico.

The following table gives the average values of chemicals, per hundred pounds avoirdupois, in Mexico, near the railroad, as compared with similar places in the mining regions of the United States:

	Mexico.	United States.
Hyposulphite of soda	\$ 8 70	\$1 25
Bluestone	9 50	5 75
Caustic soda	10 75	5 50
Sulphur	5 50	3 50
Soda-ash	7 00	3 50
Sulphuric acid (170-lb drums)	16 00	3 75
Average	\$3 60	\$4 37

The cost of all the chemicals averages about twice as great in Mexico as in the United States. But the use of the acid can nearly always be omitted when the extra solution is used. The value of chemicals in Mexico therefore averages 8.3 cents per pound, or 1.9 times as much as in the United States.

B.—Cost of the Stock Solutions.

The total amount of hyposulphite for stock solution for works of various capacities has been given as 3281, 1875 and 1406 pounds for works of 100, 50 and 25 tons respectively.

The corresponding costs in the United States of these stock solutions are therefore \$140, \$80 and \$60.

C.—Cost of Precipitating the Silver from the First Wash-Water by Various Methods.

Table XVII gives the cost of precipitating the first wash-water from roasted ore, and the values of the precipitates. Except in Mexico, where acid costs about five or six times as much as in the United States, there is little difference in cost between the method by acid and iron and that by sodium sulphide. In the United States, if the wash-water is acid, the cost is in favor of acid and iron by three or four cents per ton. In cases where the method by dilution can be used, of course the expense of precipitating is merely nominal. But generally, on account of the small cost and greater thoroughness of the first two methods, one of them should be adopted in preference to the method by dilution.

D.—Cost of Precipitating the Metals from the Leaching Solutions.

In all the mills mentioned in Table XXIII, except the Rubio in Parral working on Veta Grande tailings, sodium sulphide was used as a precipitant, and the cost of precipitating per ton of ore, as there given, is the cost of the sodium sulphide.

The comparison in cost between sodium sulphide and calcium sulphide is more favorable for the former in the United States than in Mexico, as the cost of lime in Mexico and the United States is the same, while the price of caustic soda is very high in Mexico, being usually—sometimes more than—twice as great as in the United States. Nevertheless, even in Mexico, the sodium sulphide is much superior, both in cost of chemicals and the time, labor and heat required in its preparation. A comparison between sodium sulphide and calcium sulphide, made at Cusi, may be found in the *Mining and Engineering Journal*, Vol. XLII, page 353, showing the sodium sulphide to be the cheaper by 22 cents per ton. A comparative test at Somherete, also made by Mr. Watson, resulted in the adoption of sodium sulphide in place of calcium sulphide, although caustic soda, at that time, cost 14 cents per pound (in Mexican silver).

E.—Cost of Various Extra Solutions for Acid-Roasted Ores.

A preceding section gives the weights of bluestone and hyposulphite required per ton of ore for extra solutions of various strengths. Table XXIV gives the corresponding costs of these chemicals and extra solutions per ton of ore. The cost of the extras, including the precipitating of the metals contained in them, varies from 49 cents to \$1.24, the latter representing the strongest extra solution ever used, and used, moreover, under the most unfavorable circumstances, as regards the quantity of hyposulphite required. A corresponding table of extra solutions for raw ores would show less cost for each extra, because, for the same amount of hyposulphite per ton, the stock solution will average in strength about 40 to 50 per cent higher than in the case of an acid-roasted ore, while the volume of extra solution per ton of ore is less. No table can well be given for simple alkaline roasted ore. A table for alkaline-arsenical roasted ores would be about the same as for acid-roasted ores.

F.—Comparison Between Raw, Acid-Roasted and Alkaline-Roasted Ores, as to Cost of Chemicals.

The difference in cost of chemicals per ton of ore is much in favor of alkaline, as compared with acid ores. For the former, the cost of bluestone is about 27 per cent, of hypo, 43 per cent, and of sodium sulphide, 35 per cent, less than for the latter, as is shown in Tables XIV

and XXIII. For raw ores, the average cost of chemicals is still smaller, being about 20 per cent less than for alkaline-roasted ore.

G.—Disposal of the Sulphides.

The following statistics are furnished by the manager of one of the largest mills using the Russell process, the product being from 60,000 to 80,000 ounces of silver per month.

The monthly shipments are divided into two parts, one being sent to the Chicago and Aurora Smelting and Refining Co. at Chicago, and the other to E. Balbach & Sons, Newark, N. J. The division is made for the double purpose of having two checks on the work of the assayer at the leaching-mill and also of having two re-

finers as checks upon each other. As the monthly shipments occupy a number of packages, the division is made by sending the even numbered cases to one refiner and the odd to the other, thus securing an average sample of the whole lot for each refiner. The result of this method is that the returns from both refiners are entirely satisfactory, the assays made at the mill and those by the buyers being virtually identical. As soon as the shipments are received by the buyers they are weighed, sampled and assayed, the returns being made within a week after the shipments are received. Within a week after instructions are received by the refiner to work the sulphides, the payments are made by check on New York, the silver being paid for on the basis of New York price on day of settlement, and gold at the rate of \$20.60 per ounce.

The Balbach Co. pays 99 per cent of the value of the silver and full price for gold, and charges \$100 per ton for treatment. The Aurora Works pay 98 per cent of the value of the silver and charge nothing for treatment. Their rates for gold are not known, as the sulphides in question contain only a trace. The Balbachs pay for the least trace of gold. The rate paid for copper is generally \$1 per unit, although not in the case above mentioned, as very little copper is present.

The sulphides from the Somherete mill are treated at the Argo Works, Denver, Col. The price paid by these refiners is 97 per cent of the gold and silver (silver at New York quotations and gold at \$20 per oz.) without any charge for treatment.

The sulphides from the Somherete mill contain \$700 to \$800 in gold per ton. Taking into account the silver entering the cupel, the mill assays for silver average about 0.6 per cent above those of the refiners. Without taking this into account, the refiners' assays are a little higher than the mill assays. The average of the assays on gold agree within 0.1 per cent.

H.—Details and Summary of Cost of Running the Plant.

The following statement gives the approximate amount of labor required per day of 24 hours, in the leaching department only, for a plant of 100 tons capacity, as deconstructed in various mills:

2 men on leaching-tanks at.....	\$4 00	\$8 00
3 " as helpers at.....	2 50	7 50
2 " on precipitating-tanks at.....	4 00	8 00
2 " on pump, press, drier, boiler, etc. .	4 00	8 00
2 " as helpers at.....	2 50	5 00

Total.....\$36 50
Cost of labor per ton.....36½ cents.

The three helpers at the leaching-tanks attend also to the preparation of the sodium sulphide, which occupies about three hours every two days, and also to the preparation of the extra solution, which occupies one man about two hours, two or three times each day. Of the three helpers, one is on night shift and the other two on day shift, the sluicing out of the tailings being done only on day shift, and occupying one man about four to five hours each day. For 50-ton tanks, the two

men and three helpers are more than sufficient, as the labor is much less than where ten-ton tanks are used. Also the two men and two helpers are more than sufficient for the solution pump, press, drier, boiler, sampling of the sulphides, etc. If the plant is arranged as described, the pressing of the sulphides will occupy only one man three days per week; the removing of the dry sulphides from the steam drier and replacing with wet sulphides occupies two men about four hours every three days, and the sampling also two men about six hours every three days. The boiler needs but little attention, the steam required being about as follows: A very small amount nearly all the time for heating the solution in the storage-tank and for the steam drier; steam to run two siphon pumps or ejectors, five hours per day; to press sulphides, three days per week; to run the fire pump (if tailings are sluiced), three to four hours each day; to pump the solution to the storage-tanks all day, at intervals; and for the preparation of sodium sulphide one hour every two days. At Ydras, the amount of wood used per day was three-fifths of a cord, for pumping solutions and for making calcium sulphide. Four times this amount (or two and a half cords) would therefore probably be enough for all the above purposes.

As to the removal of tailings, the cost of shoveling out and removal at Cusi was \$1 to \$11 cents per ton of ore. At Somherete, the filling of the tanks from the cooling-floor, and shoveling out and removal of the tailings, cost only 15 cents per ton, labor being cheaper than at Cusi.

At Ydras, the cost of labor and material for repairs on the leaching plant was only \$50 per month, or about four and a half to five cents per ton. At Cusi, it was several times as great per ton, owing to the poor arrangement and condition of the plant.

The silver-bearing solution coming from the ore-tanks to the precipitating-tanks should be conducted in rubber hose. But at the Cusi mill this silver-bearing solution was conducted from the ore-tanks to the precipitating-tanks by means of iron pipes, and these pipes, which are practically the only ones attacked by the solution, had to be periodically replaced. The solution-pump was set on top of the solution sump instead of level with the bottom, and required constant repairing in order to produce a vacuum sufficient to lift the solution. The 22 small leaching-tanks and corresponding valves, piping and siphon pumps also required considerable attention.

For the plant described and for 100 tons per day, the total cost of labor and material for repairs should not exceed \$150 to \$200 per month, or five to seven cents per ton.

The total cost of the various operations and chemicals required for 100 tons per day is given in the following statements, which show approximately the minimum and maximum running expenses per day of 24 hours at the rate of 100 tons per day, in the United States, as shown by actual experience. The cost of charging the ore into the tanks is not included. It would vary probably from 10 to 18 cents per ton. The removal of the tailings is supposed to be by sluicing; if by shovels and cars, the expense may be put at about 15 cents more per ton.

APPROXIMATE COST OF RUNNING LEACHING PLANT AT 100-TONS CAPACITY PER DAY OF TWENTY-FOUR HOURS.

Minimum.	Per Day.	Per Ton.
Labor, 11 men at \$3.....	\$ 33 00	\$0 33

(To be Continued.)

BARNARD'S COMET.—This comet, which was first seen by Prof. Barnard at the Lick Observatory, promises to be a very interesting visitor to our solar system. A telegram from the Dudley Observatory at Albany of the 13th instant says: "The comet has apparently remained stationary since its discovery, so that the determination of the true orbit has been a work of great difficulty. The results reached are regarded as merely approximate. According to these the comet is now about twice as far from the earth as the sun, or about 100,000,000 miles. At the same time it is about 170,000,000 miles from the sun. The comet is moving toward the earth at the rate of about 3,000,000 miles daily. About the middle of November the comet will be 60 times as bright as when discovered."

MASTER AND WORKMAN.—Edward Atkinson, in the September *Forum*, says: "The old order of personal intercourse between master and workman is gone. The small, self-contained community in which there were none very rich and none very poor has almost disappeared. The new forms of society are not yet shaped or molded. The one thing most needed now is that the rich men shall know how the workmen live, and the workmen shall know how the rich men work."

CAMPAIN WHISTLES.—A "he-he" whistle factory, near Erie, has manufactured 500,000 of them already this campaign, and is making 20,000 per day.

Passing Events.

While many events have passed since our last writing, only a few of them have been of sufficient importance, or of a kind to require mention here. The mining industry continues everywhere prosperous, and the outlook encouraging, the field broadening and filling up at the same time. The use of the hydraulic elevator in working the enjoined mines, while it does not accomplish all that might be desired, is being employed by several companies as the best that can be done.

The successful laying during the week of the corner-stone in the big dam in the American river, near Folsom, constitutes a notable incident in the history of our hydraulic enterprises.

The political caldron which began to simmer early in the summer, having a little later on been brought to a hubble, is now boiling vehemently, its intensity increasing daily and nightly to the delectation of the politicians.

The public fairs, State and county, have closed, or are about to close, after a generally successful season, the most of them having been largely attended and liberally patronized. The exhibits made were fairly, and, in most cases, highly creditable.

Agricultural Title to Mineral Lands.

There is a very general complaint among the miners of this and other States, that the area of ground on which to prospect is rapidly being narrowed in a manner never contemplated by the laws. As this system is being carried out day by day, in a few years much of the mineral lands will be covered by agricultural claims, so that the prospector's vocation will be gone. In the mountain counties of this State a large proportion of the land has been returned as mineral, and as such, by the law of Congress, it became exempt from entry under existing homestead and pre-emption laws.

Subsequently, under instructions issued by the Department of the Interior, pre-emption and homestead claimants were allowed to file their respective claims, provided that the non-mineral character of the lands, or their being more valuable for agricultural than mining purposes, was proved. Under those instructions most of the earlier entries were made, and when, later on, under instructions issued by Mr. Schurz, the then Secretary of the Interior, all lands hitherto classed as mineral were declared to be open to pre-emption and homestead entries, the owner was required to furnish the proof that the land was mineral in character in order to save his claim. Thus a very severe blow to the mining industries was struck.

Pre-emption and homestead, unless covering great areas of lands in the mining districts, immediately followed the above ruling. This caused such strong protests from the miners in some sections that some particular townships were exempted from the ruling and the settler was then required to furnish proof as to the non-mineral character of the land before his entry would be allowed. But this measure of apparent relief soon proved itself entirely unsatisfactory, and the acquiring of cheap agricultural titles to valuable mining or timber land goes on almost unchecked. The following explains the method generally adopted to obtain agricultural title to mineral lands:

A person settles in a mining district, fences in and cultivates a garden spot around his cabin or spring and enters a pre-emption or homestead claim for fully 160 acres. After that he earns a living by cutting or selling the timber from his claim to the miner or some local saw-mill, or goes to work for some mining company in the neighborhood. After the lapse of the prescribed time, he advertises to prove up his claim and names as witnesses his nearest neighbors, who at the same time have advertised to offer final proof for their respective claims of the same class. Thus, by acting as witnesses for each other, each paying only his own individual expenses, the cost of final proof is reduced for them to a minimum.

On the other hand, the miner who has located and is in possession and working a bona fide mining claim is not only obliged to pay his own expenses to the nearest land office, but also all the expenses of all his witnesses to prove that his mine is a valuable mineral deposit; otherwise he must lose his possessory title thereto. Often the various expenses of travel, witnesses, etc., make a contest on the part of the miner impossible. Therefore nobody appears to challenge the testimony of the agricultural claimant, so his final proof is accepted. Against the foregoing assertion it may be said: If the agricultural claimant or his witnesses perjure themselves, the miner has his remedy. Why does not the miner prosecute them for this? In an article to follow this we shall state the position of the miner on this part of the question.

EBERHARDT AND MONITOR.—A meeting of this company was held in London on the 1st inst., and a scheme for reconstruction was adopted. By the terms accepted, Mr. Samuel Slater, the liquidator, was authorized to sell and transfer the business, property, mines, machinery, assets, etc., of the company (except uncalled capital) to a company already registered with a capital of £75,000, divided into 300,000 shares of 5s. each. The new company shall pay all the debts and liabilities of the Eberhardt Company, and allot and issue to the holders of debentures four fully-paid preference shares of 5s. each for every £1 of debenture issued by the old company, and such preference shares should be entitled to a non-cumulative preference dividend of ten per cent, after payment of which such preference shares should rank ratably with the ordinary shares, share for share, in the

division of profits, and have a preferential claim on the assets in the event of liquidation. The new company should allot and issue to the liquidator 248,569 shares in the new company of 5s. each, upon which there should be credited 1s. per share. The liquidator was to be authorized to continue the company's business pending the transfer to the new company, which should accept the Eberhardt's title to the mines and premises.

Economics Gone Mad.

David Wells, who has written much on the subject of tariffs and other economic questions, has published recently in the Eastern press a series of articles, wherein he attempts to show that the industrial disturbances so frequent, and almost continuous for the past 20 years, have been due to the introduction of labor-saving machinery and processes, these, as he alleges, having worked to the detriment of the capitalist and the wage-earner alike. Both, contends this writer, have suffered just to the extent that these inventions have been successfully multiplied. They have injured the former by rendering the improvements in which his money was invested partially, if not wholly, useless, and the latter, by rendering his skill and experience of no avail, very often throwing him out of employment altogether.

While Mr. Wells does not, like Henry George, argue that the increment of wealth tends to increase the poverty of the workingman, he stoutly maintains that all labor-saving agencies do have that effect, impoverishing as well the investor in manufacturing or other productive pursuits. But in this we think our essayist is in error. That he greatly exaggerates the evil inveighed against can hardly be questioned. In the first place, as we all know, very few of these improved mechanisms and methods succeed at once in supplanting the old ones. However superior, it takes time to introduce them—so much time, generally, that the proprietor of the establishment, whatever it be, is enabled to adapt it to the peculiarities and requirements of the new invention, which are rarely ever so radical as to make this impossible. In like manner the operative, with his already acquired knowledge and practical skill, is empowered to master whatever is especially difficult in the new process or machine. Should a type-setting contrivance, for instance, come into use, the printing-office would be the place where it would find employment, a practical compositor being the person selected to run it. Although many labor-saving implements have of late years been brought into use in the making of shoes, they have not hurt either the proprietors or the workmen, and so of most other mechanical pursuits; these novelties have been introduced so gradually or have conflicted so little with the old order of things that all have without much inconvenience or loss been able to accommodate themselves to the new conditions.

Then, too, it must be remembered that when commodities and articles of general use are cheapened, their consumption is in about the same ratio increased, thereby creating an additional demand for labor. When a suit of clothes costs but \$10, nearly one-third more will be worn out than when it costs \$15, hence the utility of the sewing machine.

Again, these scientific discoveries and labor-saving inventions serve very often to create entirely new industries, and such as without their intervention would never have had an existence; photography, the telegraph and the telephone furnishing examples in point. But for the introduction of the hydraulic method of gravel washing, the gold since obtained from this class of auriferous deposits would have remained where nature placed it, there being no other process by which it could have been profitably extracted. One hydraulic giant does the work of a hundred men, but it does not displace these hundred men, because in its absence there would have been none of this kind of work to be done. But for the invention of a machine capable of cheaply grinding certain woods to a proper degree of fineness, no pulp from this material would ever have been produced, to the great detriment of the paper-maker and all who use his wares. Through the aid of this ingenious contrivance the question of paper supply, once a cause of much anxiety to the manufacturer, has been relieved of its stringency.

Examples of similar purport might be adduced without number, and when Mr. David

Wells sees or affects to see in these labor-saving inventions only an agent of mischief, or, to use his own language, an evil, that has destroyed a very large proportion of the capital of civilized nations, and forced a majority of their industrial laborers to change of employment, increasing largely the number who, for the time being, are thrown out of employment altogether, it may well be suspected that his mental vision is somewhat awry.

If we are to believe what this writer and the disciples of the Henry George school tell us, our scientific discoveries and mechanical inventions, all these agencies for economizing labor and increasing production, are nothing but instrumentalities of evil, in that they destroy capital and augment the poverty of the working classes. According to the idea of these theorists, our boasted progress is retrogression; our civilization but another form of barbarism.

That advancement and culture, and even the highest enlightenment, develop certain evils, cannot be denied; but that they are of the kind or magnitude indicated by this class of publicists, no sane man will contend. Past experience disproves it—shows that human life has been prolonged and human happiness increased just in the proportion that this class of improvements has made progress.

The Richmond Consolidated.

The Richmond Consolidated Company of Eureka has not declared any dividends of late, because it has not been making any too much money, or rather because it has been spending a great deal for deadwork. They have been trying with rock drills to find ore in the lower levels of the mine and have not succeeded. None has been found below the 1050 level. They are now going to try on the Albion and Williamsburgh ground. At the same time they were making the borings they were also expending large sums in explorations on the upper levels of the mine. Deadwork and prospecting has cost the company about \$50,000 during the year. The furnace was only working 28 weeks out of 52 on account of lack of ore. The output for the year was 4562 ounces of gold, 174,856 ounces of silver and 878 tons of lead, which is worth at Eureka \$57,156. On that output they only made a profit on mining, smelting and refining of \$3758. The company has, however, undivided profits of \$74,000 on hand. They have been trying to find a good mine to buy, at or near Eureka, and have the money to pay for it if one is found to suit. A good many properties have been brought to the notice of Mr. Probert and the company, but the ores are not suitable for their purposes.

The reasons for the small profits made by the company during the past half year are thus enumerated by the chairman: "First, a serious diminution in the grade of the ore, which has fallen from \$46 per ton to \$39 per ton, a diminution of \$7 per ton, which, on the 4000 tons of Richmond ore which we have smelted during the year, would amount to \$28,000, or about 55000. Secondly, the failure of the ore body discovered between the 100 and 200 levels. If you will remember, a year ago we had just struck those bodies, and they promised exceedingly well. However, as we worked upon them they turned out only small in quantity, although very good in quality. Thirdly, there was the competition for the purchase of outside ore, on which little or no profit has been made, in consequence of the high price at which we have bought. You will see by the accounts during the year we expended over 20,000, in the purchase of these outside ores, and I believe we made little or no profit on them. The next has been the low price of silver. That has been a very serious item with us. I believe silver this year has been lower, for a long time, than ever it was known to be before. It is now only 3s. 6d. per ounce, and when I tell you that, even on the comparatively small quantity which we produced last year, 174,000 ounces, a decline of every 1d. per ounce makes a difference to us of 72500. a year profit, you will see of what importance this is to us. The fifth and last cause assigned is the non-discovery of ore in the lower levels of the mine."

THE Drumlummoo mine, Montana, crushed 7284 tons of ore last month, yielding \$71,500. The working expenses for the month were \$42,000.

Illustrations of the Russell Process.

(Continued from our last.)

F.—Siphon Pumps (or Ejectors), Solution and Sluicing Pumps.

The siphon pumps made by A. Aller, 109 Liberty street, New York, are lined with hard lead, and have a platinum steam nozzle. Size No. 4, costing \$58, is the most suitable for a 16-foot leaching-tank. In using the siphon pumps for leaching, two precautions are necessary: first, the siphon pump must be upside down (suction up) so that all solution coming from the leaching-tanks, running down the sloping hose, may fall directly into the steam in the ejector. Otherwise, or if the hose has a sag in it, the siphon will act only intermittently, ejecting first steam, then solution, then steam,

suction and discharge. The fire pump for sluicing should be a Knowles (or corresponding size of other make) single cap pattern with 10-inch steam and 5-inch water cylinder, 12-inch stroke and 4-inch suction and discharge.

G.—Apparatus for Mechanical Treatment of Sulphides.

This apparatus consists of a pressure-tank, Johnson filter press and steam drier. The details of steam drier are shown in Figs. 2 and 3. In the PRESS of August 4th was given the out of the pressure-tank.

If the sulphides are to be dried by steam, the use of the filter press cannot be avoided. Near the front of the steam drier is a small windlass by which the sulphides are lifted into or removed from the steam drier. At the side of the steam drier is the sampling floor and scales.

a thorough knowledge of the mining machinery used, and for this purpose he has visited Arizona, Nevada and Colorado. After a visit to Washington and the great copper mines in Michigan, he will return home by way of England, Germany and France.

When asked how many men he employed in his various mining operations, he replied: "About 20,000 men as laborers and 6000 in smelting works." He further stated that the copper mines are eight miles square. The common workman receives 50 cents a day, but the foreman and superintendent received salaries higher than is paid for similar work here. The heads of the various departments are generally Europeans, and they received from \$150 a month to \$6000 a year.

A Japanese official recently visited the coal

A Miners' Fund.

The "Miners' Fund," at the New Almsden quicksilver mine, Santa Clara county, in this State, was instituted for the benefit of the residents of New Almsden. The employees of the Quicksilver Mining Co., heads of families, and all other adults residing at New Almsden, each pay into this fund the sum of one dollar monthly. The money so contributed is held by the manager, J. B. Randol, as trustee, to be paid out for salaries of a resident physician and of a druggist, and for the purchase of medical supplies. It is also applied to the relief of contributors whose circumstances may require it. Contributors are entitled to medical attendance and medicines free for themselves and families. Not only do the miners and laboring men contribute

etc. Secondly, the steam used must be dry, which can only be secured in this case by covering the steam pipes. The difference in effect between wet and dry steam for siphon pumps was illustrated at a mill in Arizona. The steam was conducted about 200 feet in an uncovered 1½-inch pipe. The result was that the siphon pump would not lift six inches, and was, therefore, useless. It was then need near the boiler, and lifted 20 feet, and forced the solution an additional 20 feet.

In addition to one siphon pump for each leaching-tank, there is also one for returning the clear solution coming from the filter press to the pump of the solution pump.

If lead is to be precipitated with soda-ash, one siphon pump (which should be a No. 6) will also be necessary for each of the three lead precipitating-tanks. A siphon pump is also sometimes necessary in making up the extra solution in one of the storage-tanks; for, in case the chemicals in the box with perforated bottom should not be dissolved by the time the right volume of solution had run into the storage-tank through that box, some of that solution would have to be forced up and circulated through the chemical box until the chemicals were dissolved.

The solution pump should be a Knowles 6½ double plunger, with 8-inch steam cylinder, 5-inch plunger and 12-inch stroke, and a 4-inch

The sampling floor is best made of iron plates, the larger the better, closely joined.

Coal Mining in Japan.

Rich coal-fields are found in some parts of Japan, and especially in some of the minor islands. On the island of Kiusin there are four mines now being worked. On the island of Amakusa, to the west of Kiusin, there is anthracite. An extensive coal-field exists also in the neighborhood of Tokio. There are besides, in other localities, brown coal and lignite in abundance. The Japanese have begun to work some of these seams. The output amounted to 700,000 tons in 1881, but every year has seen a great increase. The German consul remarks that the Japanese use the best European machinery and follow the most approved methods of mining adopted on the continent. It might be worth while to bring machinery of American manufacture to the notice of the Japanese, who have lately bought largely in Germany.

R. Kondo of the Mining University of Japan is now on a visit of observation to the mines of this country and Mexico. He has visited many of the gold mines of this State. Mr. Kondo is reported to be the wealthiest man in Japan, outside of the Royal family. He operates 16 different mines of gold, silver and copper in his own country. His principal desire is to obtain

and coke regions of Pennsylvania. The Connellsville Courier speaks of him as follows: "He was a high-up Japanese official, but in this democratic country his titles are dropped and he is plain Mr. T. Dan. He was sent abroad by his Government to inspect the English and American systems of coal mining and coking, and to report as to the best means of working an excellent vein of nine-foot coal underlying a large tract of Japanese territory, which is about to be developed by native capitalists, encouraged and assisted by their progressive Government. Mr. Dan is now on his way home, having spent some time in England and this country. He came to Connellsville from the anthracite region, where he had been the guest of Eckley B. Cox, the well-known coal operator in that section. During his stay here he was shown around by the superintendent of the Connellsville Coke and Iron Company. Mr. Dan, in the course of conversation, said: 'Our coal in Japan resembles yours here in the Connellsville region, though perhaps a trifle harder. We have already tested its coking qualities and find that it makes fair coke, suitable for our purposes. We use it in the foundries and the mills. As yet we do not manufacture raw iron in Japan. The coal lies about 400 feet below the surface and is being reached by a shaft, the machinery for which I purchased in America.'"

the dollar each month, but the manager himself and all the officers do the same. The company provides the physician's house and office and the dispensaries.

The fund is also used for the relief of the indigent poor, and when men are hurt in the mine. When they are wounded or injured at the mine, if they are not able to pay their board, it is paid out of this fund, and all their supplies are also furnished. It also furnishes two hospitals for those who are injured in the mine. One of these is in the Mexican camp and the other in the English camp on the hill. There is generally from \$8000 to \$10,000 in the bank to the credit of this fund. Upward of \$100,000 has been collected and disbursed since the fund was started.

In a serious riot between Italian and Hungarian laborers at Sawyerville, Canada, nine Italian and one Hungarian were killed and 40 wounded. The militia of Sherbrooke and Montreal have been ordered to the scene.

A VALUABLE discovery of gray copper is reported from the Salmon river, Idaho, mining country. One lode, 18 feet in width, attracts attention.

It is feared that Stanley, the African explorer, has met his death at the hands of the natives.

MECHANICAL PROGRESS.

The Bessemer Process an American Invention.

A Brief History of the Discovery—How Mr. Bessemer Got Hold of it from the American Inventor.

We find the following succinct but very complete and interesting history of the Bessemer invention in a late issue of the *Blacksmith and Wheelwright*. It is well worthy of perusal and should be read and preserved by every one interested in American inventions. The fact that Mr. Bessemer was obliged to divide his interest with Mr. Kelly is ample proof of the truth of his claim. The poverty of the inventor and the lack of a due appreciation of his invention by his wealthy friends, lost to him and his country the full title and name of the most important and valuable invention ever made.

The late William Kelly of Louisville, Ky., was one of the pioneer furnacemen of Kentucky. He and his brother operated for many years the Germinie furnace near Eddyville and the Sewanee furnace, near Kuttawa. While experimenting he conceived that the refining of the metal—that is, the converting of cast iron into malleable iron—could be accomplished with the oxygen of the air. With great faith in this idea, at heavy expense, he constructed as well as he could with the means at hand an apparatus for blowing blasts of heated air into the molten metal while it remained in the hearth or oven in which it had been melted from the crude ore. At first a number of experiments resulted in disappointments, owing entirely to the imperfection of his blowing or blast apparatus, but his great confidence in his theory impelled him to try again. "About this time," says a Paducah (Ky.) editor, "two Englishmen, who were experts in smelting and refining iron, arrived at his works and were given employment. With the assistance of these men Mr. Kelly made a 'more perfect' blast or blowing cylinder, and after making a dozen or more experiments he exclaimed 'Eureka!' and immediately sent invitations to a number of his friends to come to his works and witness the wonder of making horseshoes out of iron taken from the hearth or oven of a common blast or smelting furnace.

"Many went at the appointed time, more out of respect to Mr. Kelly's invitation than from a faith in seeing him demonstrate that he had discovered what Judge Kelley of Pennsylvania has since termed the 'greatest invention of the age.'

"The writer of this, then a small lad, went on that occasion with his father, and remembers well to have seen a brawny blacksmith take from the seething oven of the Sewanee furnace a quantity of molten or liquid iron to his shop, and after permitting it to somewhat cool, he placed it on his anvil, and with the merry ring of his hammer produced and threw down at the feet of the amazed spectators in 20 minutes a perfect horseshoe. Then he got more of the liquid iron, made some nails, and with those he fastened the shoe he had just before made to the foot of a horse belonging to one of the invited witnesses.

"Mr. Kelly had expended vast sums of money in his experiments, which embarrassed his firm, and in three months after his grand discovery it made an assignment and all work was stopped. The two Englishmen who had assisted him returned at once to England, and soon found employment at a furnace at which Mr. Bessemer was then, and had been for some time, trying to work out the same problem which Mr. Kelly had a few months before solved. Of course these workmen imparted to Mr. Bessemer the secrets of Mr. Kelly's discovery. Mr. Bessemer without delay adopted Kelly's methods and obtained the same results. Bessemer was then rich, Kelly was poor. Bessemer at once applied for a patent in England, at the same time filed a caveat for one at Washington. Kelly also applied at Washington for a patent about the same time. A lawsuit ensued between the two claimants and resulted in a compromise by which Mr. Kelly got only a small per cent of the royalty on the patent in this country. Had it not been for Mr. Bessemer's wealthy backers, Mr. Kelly would have won the suit and enjoyed the full benefits and blessings of his grand discovery, to which he was justly entitled."

NEW PROCESS FOR WIRE MANUFACTURE.—It is said that Mr. H. A. Williams of the Williams Manufacturing Co. of Taunton, Mass., has invented a machine for cheapening and improving steel or iron wire, which is calculated to make a change in many branches of industry in which iron, steel, copper and brass wire are used. The invention, which has just been patented, consists of a series of rolls in a continuous train, geared with a common driver, each pair of rolls having a greater speed than the pair preceding it, with an intervening friction clutch adapted to graduate the speed of the rolls to the speed of the wire in process of rolling. The entire process of manufacturing the smallest-sized wires from rods of one-half inch in size cold. The new process obviates the danger of unequal annealing, and of burning in the furnaces, and the wire is claimed to be more flexible and homogeneous than that produced by the common

processes, and capable of sustaining greater longitudinal strain. It is, therefore, specially adapted for screws, nails, cables, pianofortes, and many other uses; and copper wire made by this process is claimed to be possessed of greatly increased electrical conductivity. A new corporation, called the Williams Wire Machine Co., will be formed to manufacture the machines at Taunton.

Lead Pipe—How It Is Made and Used.

One of the most useful inventions of modern times, and one of the most common, is lead pipe, yet there are but few people who have even an idea how it is made. Ask the question and nine out of ten will reply that the lead is poured around a hole. The other will confess that he does not know. The process, however, is exceedingly simple. It is made in an upright press, and by hydraulic pressure the lead, when it is just hard enough to keep its shape, is squeezed out through a hole and around a core. Two upright stanchions support the top piece of the press and from that piece a heavy cylinder hangs down. There is a hole in the cylinder, the size the pipe is to be on the outside. Immediately below this cylinder is another, which is hollow, and in the center of it is a rod of iron which forms the core. The molten lead is poured into this hollow cylinder, and when it has hardened sufficiently a hydraulic pressure of 250 pounds to the square inch is applied from below. The hollow cylinder rises, and as it does the rod in the center moves into the center of the hole in the upper cylinder, forming the mold. As the lower one rises it fits around the upper, which presses so hard on the lead that it is forced through the hole and around the cover, and it comes out of the top as paint does out of a tube of colors when it is squeezed at the bottom, but it is lead pipe then and it is coiled up, and as soon as it is cool it is ready for use.

The manifold Uses of Lead Pipe.

The increasing requirements of modern civilization are well illustrated by the extent and variety of the uses to which lead pipe are put, especially in our large cities. Some of these uses have been enumerated as follows:

Pipes for conveying and delivering illuminating gas; pipes for conveying and delivering fuel gas; pipes for conveying and delivering drinking-water and for fire purposes; pipes for conveying salt water for street sprinkling and for fire purposes; pipes for draining and carrying off sewage and surface water; pipes for delivering hot water under high pressure, for heating purposes and power; pipes for delivering cold water under high pressure, for power; pipes for delivering live steam under pressure, for heating purposes and power; pipes for delivering compressed air, for purposes of power and ventilation; pipes for producing power where required, by vacuum or suction, and for ventilation; pipes for conveying letters and packages, by compressed air and by vacuum; pipes for regulating clocks by compressed air; pipes for conveying mineral oils; pipes for electrical wires for electric lighting, electric railways, telephones and telegraphy, and pipes for power ropes for driving machinery and moving street-railway cars.

HINTS ON WORKING STEEL.—The well-known steel-makers, Miller, Metcalf & Parkin of Pittsburgh, Pa., have recently issued a card designed for steel-workers who order steel, which contains several valuable hints, as follows: Don't forget to specify the purpose for which steel ordered is to be used. You have no idea how much more likely you are to get just what you want by doing this. Don't forget that the grain of a well-hardened and broken piece of steel is much finer than that of the bar it was taken from. If the grain is as coarse as, or coarser than, the original bar, the heat need (whatever it may have been) was too high to refine the steel in hardening. Don't decide the quality of any bar of steel by the appearance of its grain. The coarseness or fineness depends much more on the heat at which it left the hammer or rolls than on its quality. Don't try to harden any bar of steel without first removing the scale from it. You will certainly be disappointed if you do, as the outside is likely to be soft enough to file easily. Don't try to harden large tools in a small bath or still water.

RIFLING GUN BARRELS.—By means of recent improvements made in the manufacture of rifles, as many as 120 barrels can now be rolled in an hour by one machine. They are straightened cold, and bored with corresponding speed, and even the rifling is done automatically, so that one man tending six machines can turn out 60 or 70 barrels per day. With the old rifling machine 20 barrels were about the limit of a day's work; but the improved machines attend to everything after being once started, and when the rifling is completed, ring a bell to call the attention of the workman.

THE PROGRESS OF THE AIR BRAKE.—Eighteen years ago, when the air brake was tried, it required 18 seconds to apply it to a train 2000 feet long. Four years later the time was reduced four seconds. Recent experiments with the air brake on freight trains show that it can be applied to every car on a train of that length running at the rate of 40 miles an hour, and that this train can be stopped within 500 feet, or one-fourth of its own length, and all this without any serious jolting.

SCIENTIFIC PROGRESS.

Magnetic Force Acts Through Every Known Substance.

In reply to a correspondent who asserts that magnetic force will not act across a screen of iron or other magnetic substance, as nickel, cobalt and a few other substances, and for proof thereof refers to "Elementary Lessons on Electricity and Magnetism," by Silvanus Thompson, p. 77, the editor of the *American Machinist* says:

The statement in the book to which our correspondent refers says that a "magnet enclosed in a hollow sphere of iron is unaffected by outside magnetic influences." This, however, is not due to the iron being an insulating substance at all, because it is not an insulating substance. Two magnets, between which a sheet of iron is interposed, still attract each other, and will do so through any known substance, through a flame, through any known gas or through a vacuum. The fact that a sphere of iron acts in this way seems to be due to a balancing or absorption of the magnetic force, due to the form in which the metal is disposed rather than to the character of the metal itself—a fact which seems plainly demonstrated when we consider that if the half of the sphere furthest from the outer magnetic force be removed, the force will act through the other half.

It will be seen from this that in the sense in which the original question was meant, our answer was correct. Numerous individuals have thought that they could produce perpetual motion by mounting two permanent magnets at the ends of levers, in such a way as to be attracted toward each other, and by their movement cause a thin sheet of insulating material to be interposed, thus cutting off the attraction, and causing the magnets to recede from each other by the action of gravity, or of a spring; this action in its turn removing the insulator, and allowing the magnets to again attract each other; thus producing a motion which would go on indefinitely, without the expenditure of external forces. Among all the many schemes to produce perpetual motion, this, perhaps, seems, upon the face of it, to be the most feasible. But, as if Nature deliberately calculated to defeat every plan to produce such a motion, she fails to furnish the required insulating substance; at least it never has been, and we believe never will be, discovered.

Making Gas from Oil.

This has long been an attractive source of experiment for inventors, and the opinions as to its practical value appear to be quite varied. The *New York Mail and Express*, in alluding to this matter, recently furnished some facts and suggestions which may have a value to those who are engaged in this investigation. We copy as follows:

"Of the many devices employed in the manufacture of illuminating gas, none has seemed more attractive to inventors and manufacturers than the use of petroleum oil in place of coal. Some very considerable advantages seem possible by its use, and although it was pretty thoroughly tried a number of years ago and generally discarded, the question of substituting it for coal has been revived and is again receiving considerable attention.

"There is no question that the gas which can be readily enough made from the oil is very highly luminous, and this is an apparent advantage. But there are other considerations, and the first of them is the cost. It seems as though it ought to be cheaper than coal, unless at a time when coal is unusually cheap. The gas from oil is called of 60-candle power, but it is exceedingly doubtful whether it can be made to maintain that standard when stored or delivered in the usual manner to towns or cities.

"Even if it can be 60 candle gas, as it is ordinarily used, it is not worth twice as much as 30-candle or three times as much as 20-candle gas. The greater pressures at which the higher qualities have to be consumed in order to get the best results eject the hydrocarbon particles from the burner at such a rapid rate that many of them are wasted and not burned at all.

"There have been many devices for securing the greatest light from the burning of a given amount of gas, but most of the inventors start wrong. They use small burners and high pressure. When the quality of gas is stated as of such a candle-power, it can only be compared with other gas that is used through a standard burner by testing it with the same burner."

WHERE WILL DISCOVERY CEASE?—Whether all science has limits, so that at the present rate of progress all discoverable things may have become known a few generations hence, is a question that must have been suggested to many. Concerning the future of systematic chemistry, Dr. Edward Schunk has concluded that in the course of time this prolific field of to-day will be worked out. All possible compounds—or nearly all—will have been prepared, all the most important chemical facts will have been discovered, and pure chemistry will be practically exhausted, and have arrived at the same condition as systematic botany and mineralogy now are, with only rarely a new plant or mineral to be determined. Chemical science will not cease there, however, for, as

the botanist is still fully employed in investigations in plant physiology, so will the chemist find opportunities—probably far beyond our present conception—for research in such investigations as those of the processes by which organic compounds are produced in the growth and decay of plants and animals.

A GOOD WORD FOR THE ENGLISH SPARROWS.—When so much has been said against that now familiar bird, the English sparrow, we are constrained to give circulation on this coast to the following little word in his favor, which is taken from a recent number of the *Ogdenburg, N. Y., Journal*: Spare the sparrows, for they sometimes do valiant service in destroying destructive worms. The army worm has done a great deal of damage to the oats and corn in this vicinity the past spring. Charles Dubois was obliged to resow a 5-acre patch of oats and 3 acres of corn—the first planting having been destroyed by the army worm. While discussing the subject with his neighbor, John Paul, during the prevalence of the worm, Paul, who is a very observing man, called the attention of Mr. Dubois to the operations of a few sparrows which came into the field and gorged themselves on the army worm, and took hundreds to their young. He remarked to Mr. Dubois: "See there!" pointing to a sparrow, "you need not talk to me any more about shooting sparrows, for I am convinced that they do more good than harm. That bird had his mouth full of worms that have been destroying the oats." The bird flew away to feed its young and then came back. Mr. Paul again called attention to him. "See there!" said he to Mr. Dubois, "he is back after more." Mr. Dubois is now satisfied that the sparrow is worth more than he costs.

UNDER THE OCEAN WAVES.—There is very good reason to believe that it will not be long before we shall know almost as much about the topography of the bottom of the ocean as we now do of its surface. This will be brought about by means of the photographic camera, experiments with which are now being made. Thus far the best results have been obtained by the Swedish Government, which, however, have not been of any real value to science, except to open up the possibilities for the future. Most of the plates display simply a tangled mass of vegetable growth, as if the camera had been put into a thick lot of underbrush and the plates had been exposed. Still the comparatively unsatisfactory result is encouraging, and leads all scientific men to believe that before many years the floor of the ocean will not be an unknown land, as it in reality is at the present time.

ACTION OF ELECTRICITY ON ALBUMEN AND ALCOHOL.—Recent experiments in Italy give some facts which prove conclusively that a weak but continuous current of electricity through wine causes a deposit of aluminous substances, diminishes slightly the amount of alcohol, which latter is accounted for by increase of acetic acid. It gives to the wine the bouquet which is otherwise only acquired by age, and, without doubt, aids in the keeping qualities of the wine. There is a hope expressed that in time there may be a method found by which sterilization will be accomplished by electricity. The above has reference, no doubt, to the Fraser wine process, which has recently been experimented upon in various parts of Europe with the most encouraging results.

TRACES OF AN OCEAN EARTHQUAKE.—On the 16th inst. Superintendent Thorn of the United States Coast and Geodetic Survey was notified by Prof. George Davidson that the Sancelito self-registering tide-gauge on Friday commenced recording the traces of an earthquake as transmitted through the Pacific ocean. They continued until the next day at noon. Although irregular and not very large, there was yet no mistaking their character. If the earthquake was felt on the eastern coast of Asia or in any of the Pacific islands, we shall hear of it, but if it took place in mid-ocean the silent register at Sancelito will be its only direct record.

THE GREAT CLIMATIC CYCLE.—According to the calculations of M. Adolphe d'Assier, based on the assumption that the coincidence of the earth's perihelion passage with the summer solstice every 21,000 years marks the regular recurrence of a northern glacial period, the last glacial period culminated in 9250 B. C., the alternating period of greatest northern warmth occurred A. D. 1250, and the ice period now approaching will reach its greatest height A. D. 11,750. Evidence of the slow cooling during the past 600 years is seen in the changes recorded in the northern limits of the growth and ripening of certain fruits.

THE BRAIN OF THE CHIMPANZEE.—It has been found that the essential characteristics of the brain of the New York chimpanzee, familiarly known as Mr. Crowley, were human. Its weight was about a third of that of a human brain of ordinary development, and it indicated that the chimpanzee knew more than some idiots. Not many men have enjoyed so much fame as did Mr. Crowley. His gifts were numerous, and the poems and prose written in his honor were many. So much fame was too much for his brain and he was inclined to be savage.

USEFUL INFORMATION.

Floating Soap and Javelle Water.

It is a mistaken notion that there is any special magic in floating soap or soap powder, rendering them more efficient than other soaps. Floating soap may be made by any one, with no other ingredients than ordinary oil soap and water, and made to make double the bulk and weight of ordinary soap, but the product is only half as efficient as at first.

One hundred pounds of soap and a gallon of water melted and thoroughly agitated together till the mass is at least double the volume, then put in the frames, and cut and pressed when cooled.

Soap powders are dangerous because of the carelessness of servants; putting too large a quantity or putting them upon the clothes instead of first dissolving them. They are nothing but a little soap and a good deal of carbonate of soda. If carbonate of soda is wanted, obtain it at half the cost of soap powders and dissolve in water as desired, and add what soap is wanted.

The practice of using javelle water is another dangerous operation, and very many persons who wonder at the holes in their clothes, the spots on calico, and the quick decay of their garments, may readily find cause in these preparations.

Javelle water is made of caustic soda, one pound, and chloride of lime, one pound, dissolved in a gallon of warm water. A very small quantity of this will destroy any fabric, although at the same time perfectly bleaching it. But it is the want of caution which causes the injury.

HOW HE BEAT THE AUTOMATIC WEIGHER.—A New York paper says: A man, his wife and three children walked up to one of the drop-penny-in-the-slot-and-asertain-your-correct-weight machines in one of the North river ferry-houses, and after examining told his three children to step on the platform of the scale, which they did. He then dropped a cent in the slot and the hand moved around to 203. He then told the largest child to step off, and as soon as he did the hand moved back to 113; thus, by subtracting 113 from 203 he ascertained the weight of the child. In this manner he also ascertained the respective weights of the two other children. His wife and himself got on the scales and weighed in a like manner. He saved three cents.

HOW TO MAKE GROUND GLASS.—A correspondent of the *Scientific American* gives the following process by which he has made ground glass: "I first bought five cents' worth of emery and two plates of glass the size required. Spoiled negatives will answer if they are cleaned, which can be done with a strong solution of lye. I placed one of the glasses on a flat board and sprinkled a small quantity of emery on it, which I wet with water. Placing the other glass on that, I ground them together, renewing the emery and water whenever necessary. In about one hour I had two of the finest quality of ground glass, fully as good as those I would have to pay 75 cents for (8x10 size)."

A CANDLE AND A GAS EXTINGUISHER.—A new candle has been brought out which extinguishes itself in an hour. This is done by means of a tiny extinguisher of tin which is fastened in the wax by wires, and which effectually performs its task. It is only necessary to remove this diminutive extinguisher when its work is done, and the candle is again ready to burn another hour. An automatic gas extinguisher has lately been patented by Joseph Haroux of Yamachiche, Canada, which consists of a spring stop-cock, which shuts automatically when the gas is extinguished. The mechanism used is based on the lateral expansion of metals.

"SIZES" OF COMMON THINGS.—"It is astonishing to observe how few people understand the common rule of measurement in purchasing wearing apparel," said a clothing dealer. "For instance, a man will buy a coat that is a 'size' too small or too large. A 'size' smaller or a 'size' larger is what he probably needs, but he does not know what a 'size' is. Well, a 'size' in a coat is an inch, a size in underwear is two inches, a size in a sock is one-half inch, in a collar one-half inch, in a shirt one-half inch, in shoes one-sixth inch, pants one inch, gloves one-fourth inch, and in hats one-eighth inch. Very few purchasers ever understand the schedule named."

THE FLIGHT OF PIGEONS AND BEES.—The owner of some homing pigeons at Hamm bet that on a fine day 12 of his bees would heat a like number of carrier pigeons in making the distance (one hour) between Hamm and the town of Rhyner. Twelve pigeons and 12 bees (four drones and eight working bees, all powdered with flour) were taken to Rhyner and simultaneously set free. A white drone arrived home four seconds in advance of the first pigeon; the remaining three drones and the second pigeon arrived together, and the eighth working bee preceded the ten pigeons by a length.

WHAT IS A SLEEPER?—A sleeper is one who sleeps. A sleeper is that in which the sleeper sleeps. A sleeper is that on which the sleeper

sleeps while the sleeper sleeps. Therefore, while the sleeper sleeps in the sleeper the sleeper carries the sleeper over the sleeper under the sleeper until the sleeper which carries the sleeper jumps the sleeper and wakes the sleeper in the sleeper by striking the sleeper under the sleeper, on the sleeper, and there is no longer any sleeper sleeping in the sleeper on the sleeper.

PAPER GUNPOWDER.—At the Royal powder factory of Wetteren, in Belgium, a new gunpowder is being made. They call it pondrapapier, or paper powder, and it is said that a charge of 2½ grammes (39 grains) gives, in a rifle of small caliber, an initial velocity of 660 yards to the ball. This is equal to, if it does not beat, the Nobel powder. The additional advantages are attributed to it of not smearing the barrel, of producing no smoke and of causing little recoil.

NATURAL SOAP WELL.—A natural soap well has been discovered near Buffalo Gap in Dakota. The soap is skimmed from a boiling spring, and hardens by exposure to the air. It is like soft clay, and can be gathered with a shovel. It is supposed to be a mixture of borax, alkali, and lubricating oil. The quality is excellent, and the supply is believed to be inexhaustible.

INDIANS AND THEIR INDUSTRIES.—Indians in the United States last year cultivated 227,265 acres of land, and raised 724,928 bushels of wheat, 934,972 bushels of corn, 512,137 bushels of oats and barley, 524,010 bushels of vegetables, and 101,825 tons of hay. They also owned 358,334 horses and mules, 111,407 head of cattle, 40,471 swine and 1,117,273 sheep.

THE BEE INDUSTRY.—According to the *Bee Journal*, there are in North America about 300,000 persons keeping bees. The annual honey product is about 100,000,000 pounds, and its value nearly \$15,000,000. The annual wax product is about 500,000 pounds, and its value more than \$100,000.

THE OX AND DOG IN CHINA.—It is not generally known that in China it is a less crime to steal an ox than to steal a dog. The former is simply personal property, but the latter takes the place of a man—a watchman. And quite right, too.

A NOTED HORSESHOE.—A Dayton (Ohio) blacksmith has made a horseshoe from nails gathered from every State in the Union and presented it to the President.

GOOD HEALTH.

The Sightseer's Headache.

Of the lighter penalties which pleasure entails, none probably is more widely known and felt or more persistently endured than the sightseer's headache. It is nature's tax levied on the comfort of that great body of busy idlers to which we all at some time or other belong. It is endemic among the frequenters of museums, picture galleries and exhibitions. The very general prevalence of this variety of headache, and its independence in many instances of any vitiation of atmosphere, teach us to look for its explanation in other causes. The effort of mind implied in long-continued observation, even though this does not involve the strain of study, has probably an appreciable, though a secondary, influence.

Fatigue certainly has an important share in its production; but it is with most persons rather fatigue of muscle than of brain. The maintenance of the upright posture during several hours of languid locomotion, the varied and frequent movements of the head, commonly in an upward direction, and the similar and equal restlessness of eyes whose focus of vision shifts at every turn as a new object presents itself, form a combined series of forces more powerful in this respect than the sunlight and frequent changes of mental interest and attention by which they are accompanied. The muscular strain implied in these movements is necessarily very considerable. It affects more or less every member of the body, but the distant localization of the resulting ache has probably much to do with the unusual activity of the cervical extensor and rotator muscles, and of the muscles which move the eyeball. Whatever the minor influences at work, therefore, there can be little doubt that mere fatigue is primarily accountable for this most general form of headache, and that rest and nourishment are most reliable antidotes.

The utility of stimulants for this purpose is necessarily temporary and deceptive. One improvement on existing arrangements ought to be of real assistance to the suffering sightseer, if more generally introduced by responsible authorities. The comparative scarcity of seats in many places of amusement has often been noticed. It would be much to the public advantage if this want were supplied. For the attendants at exhibition stalls a chair for occasional use is an absolute necessity.—*Eastern Exchange.*

DANGER IN FILTERS.—There is much danger in filters which are not properly cared for. A filter that cannot be washed clean every day ought not to be used. The reason is given as follows by the St. Louis *Globe-Democrat*: A most astounding revelation has come to those

who have been confidently trusting to appliances for purifying their drinking water. It seems that the ordinary filter, instead of rendering the water pure and safe, is actually the means of producing just the opposite result. The Rhode Island Medical Society, through Dr. Swarts, shows that some filters when first need do remove a proportion of disease germs. But after being in use only a few days there is a marked increase in the number of colonies of germs in the filtered, as compared with the unfiltered water. In one instance the unfiltered water showed the presence of 36 colonies, while the filtered contained the enormous number of 2000, 3000, 9000, and even more. That is, the poison caught up by the filter the first few days becomes a source of a vast multiplication of the dangerous element. So look to your precautions and then be on your guard. If you cannot constantly cleanse your filters, you had better destroy them.

ELECTRICITY AS A PAIN-KILLER.—There seems to be no limit to the useful applications of electricity. Mayor Hewitt was not far wrong in his late assertion before the Electric Convention in New York, that "electricity was only in its infancy." The latest application is noted by the *New York Mail*, which describes a novel experiment recently made by a dentist in that city. The *Mail* says: "A lady who went through the trying ordeal is responsible for saying that a dentist in this city has successfully introduced electricity as a substitute for gas. She went to him the other day to have a tooth filled, and as she feared to take gas, anticipated martyrdom. The dentist asked her if she would not try electricity, and his explanation satisfied her of its painlessness and safety. The dentist had a small battery with which he charged her, and when he placed the forceps to the tooth to be pulled, the instrument acted as a conductor of the electric fluid which flowed from the tooth. When he pulled she felt no pain, the electricity seeming to neutralize it, as if gas had been administered. The patient besides felt exhilarated and strengthened by the operation. There seems to be no longer any reason why the filling and pulling of teeth should be accompanied with such fearful dread and subsequent agony." If electricity is thus effective in tooth-pulling, why not in ordinary surgical operations? Are we on the eve of a substitute for the dangerous and exhausting use of anesthetics in surgery?

IODINE FOR ANT STINGS.—Edward Hyatt writes the San Jacinto *Register* as follows: "Only those who have been stung know how to appreciate the misery of the 'harefoot boy with cheek of tan' who has stepped on a red ant. Little children will sometimes cry for three hours from a single sting. I have tried camphor, liniments without number, ammonia, soda, alcohol (externally used), and everything else that the fertile imagination of numerous friends could suggest, without obtaining the slightest relief. Happening one day to rub a drop of iodine upon a fresh sting, I was surprised to find that the pain at once ceased. Since then numerous trials have shown that it is a good thing. Ten cents' worth of iodine from the nearest city drug store will save \$10 worth of pain in a very short time. If the stains of the iodine are objected to, the discolored variety may be obtained."

AN ELECTRIC DISEASE.—What has been called "electric prostration" seems to be a new disease which troubles workers under electric light. Severe cases are reported from Creusot, France, where an electric current is used for quickly heating metals. The light exceeds 100,000-candle power, and the men suffer from it, not from the heat. After one or two hours the workers have a painful sensation in the throat, face and temples, the skin becomes copper red, and an eye irritation begins that lasts 48 hours, the discharge of tears being copious. After five days the skin peels off. Dark colored glasses somewhat mitigate the effects of this tremendous light, but not entirely.

SWEAT GLANDS.—The number of sweat glands in a man has been estimated at 2,300,000. It has been calculated that a healthy adult man loses by the skin two pounds daily; a horse weighing 800-weight loses 14 pounds 5 ounces, and some small animals, such as the guinea-pig, as much as one-twelfth of the weight of their bodies. The watery vapor thus excreted contains five parts in 1000 of solids.

MEDICAL PROPERTIES OF EMMENSITE.—In an address before the Lehigh Valley Medical Association at Easton, Pa., on the 15th inst., Dr. Benjamin Lee of the State Board of Health stated that the new explosive, emmensite, when inhaled through the nostrils, will check a cold in the head, and if taken internally it is a febrifuge, and is useful in malaria.

TO REMOVE TARTAR FROM THE TEETH.—Should any little incrustation (tartar) appear on the sides or at the back of the teeth, which illness and very often the constant eating of sweetmeats, fruit and dishes containing acids will cause, put a little magnesia on your brush, and after a few applications it will remove it.

DANGER FROM HEMLOCK BOUGHS.—Bernard and Joseph Molloy, at Consett, England, sucked the ends of fresh hemlock twice a few days ago, and died in a short time. The doctors decided that hemlock was a virulent poison in the spring season.

ENGINEERING NOTES.

The Panama Canal.

This great work seems to afford an endless theme for discussion, speculation and peonulation. The facts that have been set forth with every reasonable presumption of correctness, reveal the most colossal incompetency or culpability of those who have the work directly in charge. How it is going to end only the fullness of time can reveal.

The latest financial scheme—the lottery enterprise—though apparently successful, does not appear to be so in reality. The *Economiste Française*, an eminent home authority, says it has proved a partial failure—of the total amount subscribed, no less than \$4,000,000 will be absorbed by the Government deposit required to guarantee the yearly drawings for redemption of loan, and by the immediate requirements of the company for interest. The amount left for the immediate continuance of the work is a sum altogether insufficient to secure any considerable progress, leaving out the matter of its final completion.

In the meantime, M. De Lesseps continues to promise the opening of the canal in 1890, in spite of the fact that it is now well known that this would be utterly impossible, even had the company abundance of means at its command. It is evident, indeed, that a crisis is fast approaching, and that a suspension of work, if not a total collapse of the company, is among the probabilities of the immediate future.

But little progress has been made since the report of Mr. Roudier, who said: "The only portion of the canal so far open to navigation, and that only for light-draft boats, is that portion from Colon to Gatun, which has been done by the American Dredging Company. This portion has been dredged to the depth of six meters out of the necessary 15. The other portions of the vast work are so little developed that it is impossible for any living man to make anything but a guess at the possibilities of completion. It is generally reckoned that the Culebra alone will take five years of hard and intermittent work. It is only by continual watching that landslides are to be avoided, and there is no doubt that if the works were to be abandoned for any period of time, through lack of funds or other reasons, the result would be most disastrous."

The lottery scheme is still denounced in Paris as a masterpiece of charlatanism; a dragging of the scheme into French politics, at a time when the Government most readily could be hectoring into giving its managers the necessary authority to delude their trustful countrymen into subscribing more hundreds of millions to go the way of those that have preceded them.

THE PROJECTED RAILROAD ACROSS ASIA MINOR.—The consular reports lately issued by the English Government include a paper which presents some interesting details relative to the projected railway from Scutari, the Asiatic suburb of Constantinople, to Bagdad on the Tigris. In August last an imperial order was issued sanctioning the construction of the proposed line by a syndicate of English financiers. A French company, in favor of adopting a narrow-gauge system, also made a bid for the contract, but the Sultan decided for the British competitors and for a wide-gauge road. It is estimated that the line can be built at a cost of \$77,500,000. Its length is 1400 miles, or more than 100 miles greater than that of all the present Turkish railway systems, European and Asiatic combined. Once in successful operation, the road will create a new Asia Minor, open to the trade of the world a wide territory now closed, totally change the character of the country, and practically advance Turkey in Asia from, say the sixteenth to the nineteenth century. Navigation from Bagdad, the terminus on the Tigris, to the Persian Gulf, is easy. A new through highway to the East, independent of the Suez canal, will thus be open, which will bring Europe nine or ten days nearer to India than it is now.

CHINESE CANALS.—The early canals of China, although destitute of locks, do not appear to have been on that account formed on a uniformly level line, unadapted to varying heights. It is very doubtful, indeed, if the use of locks has even yet been introduced into China, intersected as it is by many canals of great antiquity and extent, the Imperial canal being about 1000 miles in length. This canal appears to have been completed in 1289, and is said to extend for a distance of 40 days' navigation, and is provided with many sluices, and when vessels arrive at these sluices they are hoisted by means of machinery, whatever be their size, and let down on the other side into the water.

THE POUCHKEEPSIE BRIDGE.—The last span of the great Poughkeepsie bridge across the Hudson was completed August 30th. Railway connection between the New York and New England systems is being pushed by the construction of a short link of road on each side of the bridge, and it will not be long before this important structure will be in use, materially shortening the distance from Boston and other New England points to the Pennsylvania coal-fields and to many portions of the country farther west.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

PLYMOUTH CON.—Amador Ledger, Sept. 22: Nothing has been done toward reopening the Plymouth Con. It is now said that there is no water to be had for running the hoisting works, and that there is no hope of getting water until the winter rains set in and furnish an increased supply for the canal. This is not probable before the latter part of November.

AMADOR GOLD MINE.—Connection was made on Wednesday between the north and south shafts, 300 feet apart, at a depth of 250 feet. The drift on the north has been run 35 feet, the rich ore streak heretofore spoken of continuing unbroken. The west drift, in the direction of the main ledge, shows a large ore body, with a fine black gouge. This vein is thought to be of paying grade throughout, although no free gold is visible to the naked eye. It is no doubt identical with the ledge found in the Amador Queen and Doyle mines, in Hunt's gulch. The framing of timbers for the mill is progressing rapidly—in fact as fast as the lumber is being received. The running expense of the mine last month reached the sum of \$9500.

MISCELLANEOUS.—The 10-stamp mill is all on the ground at the Reed & Askey claim, near Irish Town. It will be put together as fast as possible, and in three weeks more it is expected to have it in operation. The North Star has developed no change worthy of note. There is quite an increase in the flow of water in the drift which is being run east, and this is taken as a favorable indication. It is expected to run from 50 to 100 feet farther before quartz is encountered.

SUTTER CREEK MINE.—This company has started its 10-stamp mill, being closed down 20 days on account of slackness of water. The late rain has raised the water in the Amador canal. The company hopes to run its mill without any more stoppages. In upraise, 30 feet from main tunnel, have cut through some very rich strata, and notice a great improvement on the plates in the mill.

TRIPP MINE.—Dispatch, Sept. 22: This mine, near the Big Bar bridge below Jackson, looks decidedly well. A tunnel has been run in the side-hill 400 feet, where a ledge 12 feet wide has been encountered. This is 160 feet below the surface and is all pay rock. The Sutter Creek and Hector Gold Mining Cos. contemplate laying a 15-inch pipe jointly; the former company with a view of adding ten more stamps to their plant.

VOLCANO GOLD GRAVEL CO.—About 10 or 12 years ago, a company was incorporated for the purpose of mining out the flat southeast of Volcano. It was seen that something would have to be made to carry away the tailings. A tunnel was begun about a mile below the town, and after being completed, extended to the ground that was intended to be mined. The mining was then commenced and the debris was carried off by means of a flume extending through and about one-quarter of a mile beyond the lower end of the tunnel. Water was carried by means of hydraulic pipes and turned upon the loose soil, and so it is carried to-day, and perhaps will be carried when you and I have sunk behind the hill from whence none return.

CAUCASIAN.—This mine, situated near the Lady Bedford, is one of the best undeveloped properties in Amador county. The shaft is down 100 feet on the ledge, which is six feet wide. The rock in the shaft is uniform, and will go \$11.50 per ton. Mr. Vaughan, the owner, is pushing the work right along at the mine and has won for himself the name of "a practical miner."

LADY BEDFORD.—A. M. Vaughan, the owner of the above mine, sold it last Monday to J. H. Gillenwater. The price paid was \$1750. The property is situated near Enterprise and Mr. Gillenwater can congratulate himself on a good bargain.

GOVER.—Supt. Call is busily engaged laying the new pipe from Quartz Mountain. The water through this pipe will have a pressure of 423 feet at the mill, and 380 feet at the mine.

Calaveras.

NEVILLS.—Angels Echo, Sept. 22: The Nevills mine in this town never presented a better appearance than at present. It is unquestionably one of the best managed mines in the mountains. It is now 400 feet in depth, and in a few weeks sinking will be commenced and kept up to the full capacity of the machinery now in use.

ANGELS MINES.—Calaveras Chronicle, Sept. 22: The Nevills mine, superintended by D. P. Pierce, is being run constantly, with sufficient ore in sight to last two years. The main shaft has reached a depth of 400 feet with a ledge averaging 20 feet in width. At present the mine is being worked by stoping, but sinking will soon be resumed. There is a 20-stamp mill, run by water-power and crushing on an average of 50 tons of ore daily. Twenty-nine men are employed at this mine and its current expense, we are informed, is about \$2800 per month. This is one of the most substantial mines in the county. The Confidence, managed by D. H. Jones, is about 200 yards from the Nevills on two parallel veins from four to six feet in width. The ore will mill from \$20 to \$40 per ton, while the sulphurets are very rich and will yield all the way from \$300 to \$2000 per ton. From a recent assay of 1500 pounds of the sulphurets \$1480 was realized. There is a five-stamp self-feeding mill on the mine crushing on an average of seven tons of ore daily, also a Frue concentrator for saving the sulphurets. Hoisting is done by a 45-horse power steam engine, the same power also running the mill, pump and concentrator. The main shaft is at present down 100 feet and the rock is looking better as depth is attained. It is the intention of the company, we learn, as soon as another 100 feet is reached, to connect this mine with the Nevills mine by a tunnel, in order to secure better ventilation as well as an escape for the miners. Twelve men are employed at this mine. The London, situated at Albany Flat, is one of the most promising ledges in that district. This property is owned by Messrs. Jones & Reed. It has a 25-foot ledge of free-milling ore, prospecting from \$3 to \$70 per ton. A contract has been let to run a tunnel 280 feet which will tap the ledge at a depth of 180

feet from the surface. This mine is on the west belt of the mother lode. The Maggie Moore mine, at Chaparral Hill, adjoins the Hayward & Hobart mine. It has a fine 60-foot ledge which prospects at \$5 per ton. The mine is owned by John Miller and has been bonded to J. H. Reed for one year. The Stevenot property, comprising a large tract of mining land at Carson Hill, has been sold to an English company who intend erecting a 100-stamp mill on the same.

Nevada.

GRANITEVILLE.—Tidings, Sept. 18: This sleepy village of less than two years ago is now a representative mining camp, with all that name implies, save that reckless lawlessness does not exist. New dwellings and boarding-houses are going up, new store buildings being erected, and all is life. Developments in quartz have brought about this evident prosperity, and in particular the developments in the Rocky Glen mine, owned by Alvina Hayward and partner. This property promises to become one of the greatest mines in the history of the county. Other claims are showing up and dozens of prospectors are in pursuit of buried bonanzas. One of these delvers struck it rich last week, according to Jas. R. Smith of this city, who was in Graniteville on business at the time. The man came into town with his mule laden with quartz, which showed gold freely. The find was made in the vicinity.

AN IMPORTANT ENTERPRISE.—Herald, Sept. 18: On the other side of Sugar Loaf, Jerry Blake is prosecuting an enterprise upon the success or failure of which this place has a great interest. His company is running to tap the Manzanita channel. Work was commenced this spring and has been steadily proceeded with up to date. They sunk a shaft 170 feet deep and then commenced to drift. The drift is about 150 feet in blasting rock. The drift will be continued until the channel is reached, or until it is believed it is under the center of the channel, which if not encountered then, an upraise will be made to tap it. If successful, the development will give scope for large operations by that company and stimulate other owners along the line of the lead to also commence operations. The present showing in the Manzanita mine warrants Mr. Blake's company in expecting to strike a rich and extensive mine.

THE DELHI.—Nevada Herald, Sept. 22: The Delhi is an even-tempered and perpetually smiling young Miss. She has no frowns for her admirers, but is always coquetting with them. On Sunday and Monday of this week the amalgam taken from the plates alone was worth \$1000, with an even chance that the amount contained in the batteries equalled or excelled it. The lower tunnel has reached the ledge and pay-shoot, and the rock comes up to the expectations of the owners. The sulphurets works will soon have caught up with the supply on hand and will consequently shut down for a time.

LIKELY TO START UP.—Herald, Sept. 18: We hear that parties have leased the Nevada City mine and will commence operations there soon. If the report proves true it will be good news for this section. It is well known that the mine is a good one. The starting of one mine will stimulate other owners to renew operations. It would not take three months to revolutionize times around this city if the really good mines heretofore were put in operation. The mines are here, but owners have been waiting.

NEW MILL FOR THE PITTSBURG.—Grass Valley Union, Sept. 20: The Pittsburgh Mining Co. is having plans and specifications drawn for a new 10-stamp mill, which will have all the best and latest improvements for saving gold and sulphurets. It is the intention to build this mill with the least possible delay. The favorable developments in the Pittsburgh justify the erection of a new mill to take the place of the present mill, which is old and not up to the requirements of the present modes of milling.

TWO MINES BONDED.—Herald, Sept. 22: J. Ream of Sacramento, as representative of a company of Chicago, Ill., and London, Eng., capitalists, has bonded for a term of four months the Merrifield and Charonnat quartz mines in this city. It is expected that some of the members of the company, with their experts, will arrive here within a few weeks to make a careful examination of the properties, both of which have been heavy producers in the past.

MACHINERY FOR THE ERIE.—Nevada Transcript, Sept. 19: To-day 22,000 pounds of milling machinery will arrive for the Erie quartz mine near Graniteville. This property at one time produced considerable gold, but some years ago it got a set-back from which it is now recovering. A company represented by E. W. Roberts of the Baltic mine has taken hold of it and will push its development as fast as possible.

GOOD ORE AT THE CALIFORNIA.—Transcript, Sept. 23: It is said that in the lower tunnel of the California mine, on Gaston Ridge between Graniteville and Washington, the ledge is 17 feet thick and averages \$25 a ton. The California has for quite awhile past been paying well, and is now in a way to yield larger returns than ever.

THE NEW MILL FOR THE ERIE.—The milling machinery that arrived here last week for the Erie mine near Graniteville will be built and in operation before snow flies. The San Francisco company which has the property bonded from Frank Morse will lose no time in opening it up.

Shasta.

FROM IGO.—Cor. Shasta Courier, Sept. 22: A party of experts was up the past week examining P. Gibney's mines and others adjacent. Mr. Shaffer is taking out ore at the Live Oak, to run through the Eubanks arastra, where water is plenty for power. L. U. Duhig is finding some good ore in a ledge near his place. J. P. Wright is working two shifts on his lower tunnel, and shipping sulphurets. Shirland Bros. have bought D. H. Hubbard's mining interests. They are running their arastra on Pacific ore, and running a lower tunnel; also taking ore out at the Lone Star. E. L. Ballou's arastra is running on Hope ore. A tunnel run to connect with the old workings shows considerable good ore ready to stoep. He is also running a concentrator on tailings.

QUARTZ.—Shasta Courier, Sept. 22: Rich discoveries of gold-bearing quartz have been made on Soda creek, near Lower Soda springs, and several locations have been made by different parties along the creek.

CALUMET.—Shasta Democrat, Sept. 20: The Calumet M. Co.'s mill, which has been lying idle for

some months, pending the placing in of their water-power and other machinery, will be ready to start up about the 1st of October. This company has placed in their works a 200-horse power Knight water-wheel.

THE AMERICANIZED ARASTRA.—The Calumet Co. has put several more of these arastras in their mill. Nothing beats these arastras for saving gold.

Sierra.

MOUNTAIN MINE.—Sierra Tribune, Sept. 22: Mr. Robt. Barton was here this week as the guest of Mr. O. Sunderhaus, examining mines hereabout. From this place he took his departure for London. Mr. Barton visited the Young America and Mountain mines, and to the Tribune representative expressed the opinion that these were among the best mining properties in the State. Apropos to the subject, we may say that operations are going steadily on at the Mountain mine. About 150 feet in No. 1 tunnel, a raise has been put up 60 feet and a fine body of ore encountered. No. 3 tunnel is being run ahead. No. 4 adit will be started shortly, which will give 700 feet stoping ground below the present workings, and 130 feet entire depth on the vein. It is expected to have this tunnel in to the ledge and all connections made above by the time the mill is built, which it is pretty well decided upon will be next July.

Siskiyou.

PROSPECT WELL.—Yreka Journal, Sept. 19: We learn that George Simmons and others have found a very rich ledge on Humbug creek, above Thornton's late discovery, which prospects exceedingly well. Thomas Orr has just had a lot of quartz crushed at Forks of Humbug mill, from the dump of the Siskiyou ledge, which he now owns. It is reported this quartz will realize a rich cleanup. The Hegler Bros. and Bruce Aldrick are still running their mill on Humbug, with excellent success, having an abundance of good paying rock on hand. Their mill has been running steadily all summer, crushing only about 20 tons for other parties.

Tuolumne.

POCKET MINE.—Union Democrat, Sept. 22: It is reported that the Phillip brothers at Chili camp are doing well in their pocket mines. Messrs. Chris. Drescher and Elias Dunaway are still getting big results at their mine on Blue gulch. J. B. Curtin of Cloudman's was in Sonora this week. He is about putting on a ten-animal team to run from Oakdale to the Eureka Consolidated and Summerville. The big ditch on the Stanislaus river that is to carry water to the 100-stamp mill at Robinson's Ferry will extend above Parot's ferry, and be about six miles in length. Mr. J. P. Kerrigan of the Platt and Gilson mine informs us that two new engines are now being placed in the mill, and all the machinery equipments strengthened for continuous and effective work this winter.

CARLOTTA.—We learn from good authority that the total returns of the crushing of the ore from the Carlotta mine (formerly erroneously mentioned as the Laura) have been received. Ninety-one tons in all were crushed and yielded \$4700. This is considerably over \$50 per ton. There is about five per cent sulphur to the ton, which is comparatively a higher percentage. We understand that the sulphur assays very high. Mr. Symons is now getting out a heavier crushing of ore, and the lode continues its fine record.

DORSEY.—Messrs. Bauli, Williams & Co. are doing good work in the Dorsey claim. The shaft is now down nearly 100 feet. Everything is looking well, the lode being strong and carrying a live quartz which has every indication of being in close proximity to gold. The parties expect to reach slate shortly, when no doubt a pocket will be developed.

Yuba.

THE JUNCTION MINE.—Nevada Co. Herald, Sept. 22: The above mine is at the junction of the North and Middle Yuba rivers, two and a half miles from San Juan. The formation is about 35 feet wide, mostly of slate with stringers of quartz running through the formation. On the hanging-wall there is heavily sulphureted galena ore. The sulphurets in the balance of the lead are copper pyrites. It is said the sulphurets assay from \$300 to \$600. The rock yields from 10 to 15 per cent of these sulphurets. The developments so far consist of a shaft 50 feet deep. From the bottom a crosscut has been run into the formation 16 feet. The owners have also started a drift south on the hanging-wall. It is intended to put up a crushing-mill and concentrating machines before winter sets in. Considering the size of the ledge, the abundance of free-water power and the general surroundings, the ledge bids fair to be valuable.

NEVADA.

Washoe District.

BEST & BELCHER.—Virginia Enterprise, Sept. 22: West crosscut No. 1 from the main northwest drift has been extended 43 feet; total length, 188 feet. The formation is quartz, giving low assays. Near west crosscut No. 1 have advanced a west drift 20 feet and a west drift 8 feet.

CON. CAL. & VIRGINIA.—On the 1435 level the east crosscut started from south lateral drift No. 2 at a point 70 feet south of west crosscut No. 1, has been extended 15 feet; total, 61 feet. The face is still in vein material giving low assays. The stopes east of the winze below this level are yielding the usual quantity and quality of ore. On the 1500 level the southeast drift 58 feet above this level, which extends from the upraise, is still yielding a large amount of good ore. On the 1600 level much good milling ore is being extracted from the drift south from the Ophir line at a point 36 feet above the track floor. On the 1650 level, the upraise from the drift running south from the east drift from the Con. Virginia shaft has been carried up 20 feet; total, 86. Are continuing to stoep out ore at the end of the south drift. During the week the usual amount of ore is being shipped to the Morgan and California mills. The pulp assays will average about the same as last week.

GOULD & CURRY.—On the El Dorado tunnel level the east crosscut from the main south drift has been extended 11 feet; total length, 67 feet. The face is in porphyry and work has for the present been discontinued. The north drift started from west crosscut No. 2 has been extended 7 feet; total length, 52 feet. This drift has connected with the main incline from the drain tunnel. East crosscut

from the top of upraise No. 1 has been extended 22 feet; total length, 30 feet. The formation is quartz and porphyry. On the drain tunnel level the south drift started from east crosscut No. 2 has reached the south line, and from this point an east crosscut has been advanced 36 feet, passing through low-grade ore.

HALE & NORCROSS.—Good headway is making in the exploring drifts on the 500 level. On the 600 level the south upraise has connected with the south drift on the 500 level. The north upraise from the 600 level is up 26 feet, and the west drift from the 800 station is out 102 feet. It is in ground of a very favorable appearance. The company has on hand \$31,700, with all debts paid.

CONFIDENCE.—The mine is being thoroughly overhauled and repaired. Good progress is making in this work, and the several levels and the mine will be in fine condition for economical and rapid work when the extraction of ore is resumed.

SAVAGE.—The southeast drift on the 400 level has been extended 36 feet, and the south drift on the 500 level 44 feet. The whole width of the last-named drift is in paying ore. A good deal of repair work is being done on various levels, and repairs are also being made in the main shaft.

CROWN POINT.—On the 700 level No. 1 crosscut is now out 75 feet. It shows a considerable amount of milling ore, also a small flow of water. The work in prospecting sections promises well. The drift to connect with the Suro tunnel is out 785 feet.

UNION CON.—The joint Union and Mexican north drift, started from the east drift from the Ophir shaft on the 1465 level, has been extended 40 feet; total, 288.

WEST CON. VA. & CAL.—The main shaft is about 260 feet deep. Some very rich bunches and stringers of ore have been encountered during the sinking.

UTAH.—The east crosscut on the 472 level has been extended 40 feet; total length, 188 feet. The formation is porphyry and clay, showing some water.

MEXICAN.—The joint Mexican and Union shaft drift, started from the east drift from the Ophir shaft on the 1465 level, has been extended 70 feet; total, 258.

SEG. BELCHER.—Good headway is making in the south raise. It is now up about 100 feet. The material encountered is of a promising appearance.

SIERRA NEVADA.—East crosscut No. 2 from the main south drift on the 520 level is still in a porphyry formation, which is showing some quartz.

OPHIR.—Good progress is making in reopening and retimbering the old east drift on the 1465 level. A good deal of exploring work is being done.

BELCHER.—At the 200 level a station is being excavated preparatory to starting a north drift. At the old shaft the incline is being repaired.

ALTA.—The mill and concentrators are doing good work. The ore-producing sections of the 825 and 1150 levels are looking well.

YELLOW JACKET.—Good progress is being made in the surface repairs. The foundations of the machinery are being overhauled.

OCCIDENTAL.—Extracted 128 tons of ore and shipped to the mill 114 tons. Value of wagon assays, \$22.

JUSTICE.—Good headway is making in the erection of the new mill. The mine continues to look well.

SCORPION.—There is no change in the material encountered in the south drift on the 500 level.

LADY WASHINGTON.—The upraise from the 725 level is making good progress.

KENTUCK.—Good headway is being made in the work of sinking the shaft.

BALTIMORE.—The work doing in this mine is confined to the 382 level.

ANDES.—Are engaged in the work of retimbering the main shaft.

BULLION.—Usual work going on in the prospecting drift.

OVERMAN.—Exploring work still in progress.

Eureka District.

SHIPPING TO SALT LAKE.—Eureka Sentinel, Sept. 23: We understand that upward of 2000 tons of ore will be shipped to Salt Lake from the Hamburg, Jackson, Dunderberg, Diamond and other mines of the district, owing to the combination between our local smelting companies and the high rates charged by them for reduction. It is claimed by the shippers that they can realize from \$3 to \$12 per ton more on their ore over and above the expenses of shipping and treatment than would be paid in Eureka. A large number of ore sacks have been ordered from San Francisco and the shipping will follow upon their arrival.

ORE SHIPMENTS.—During the past week ore shipments were made from the following named mines of the district to the furnaces: Hoosac, 42½ tons; Eureka, 1¼; White Pine, 3; Storm, 2¼; Silver Lick, 13; El Dorado, 6; Rocky Point, ¾; Geddes & Bertrand, 7½, and the Evans, ¾. From the Silver Connor mine, 186 tons; Silver Lick, 31; Rosecranz, 2; Brown, 16; Banner, 10; Woodchopper, 11; May Lode, 4; Reindeer, 2; and the Little Rose, 11.

New Pass District.

MINING REVIVAL.—Silver State, Sept. 18: There is a mining revival in New Pass district. The district is situated on the line of Lander and Churchill counties south of the Humboldt boundary and about 23 miles west of Austin. The mines were discovered many years ago, the principal leads being the Superior and Gold Belt. They are gold-bearing veins and are developed to a considerable extent by tunnels and shafts. A five-stamp mill was erected to work the ores, which gave about \$25 per ton in gold. This did not pay in those days and the mines were abandoned during the White Pine excitement in 1868 and the mill taken away. The mines were patented by an Eastern company, of which Capt. C. B. Dahlgren is agent. The ledges are from one to four feet wide and tests of the ores recently made have been satisfactory, and work will be resumed on the leads immediately. The company purpose using Huntington pans in working the ores.

Wild Rose District.

THE PARADISE MINES.—Silver State, Sept. 18: T. J. Bradshaw of Paradise brings very encouraging

news from the mines. He says they have cut a five-foot ledge in the Paradise Valley, 18 inches of which averages \$100 in silver to the ton. How extensive this ore body may be is not yet known, as the ledge was cut last week. Three shifts of men are at work upon it, and the rich ore streak is steadily widening. In the Wild Goose, which is owned by the Paradise Valley, a shaft has been sunk 100 feet in the tunnel, at the bottom of which there is a large body of good ore. A hoisting engine has been ordered for use in this shaft, and a boiler is now being put in place. The Cliff mine is also looking well and producing very rich ore. Mr. Bradshaw says the mining outlook is better than it has been for a year.

Tuscarora District.

DEL MONTE.—*Times-Review*, Sept. 22: The combination shaft has been sunk and timbered to feet. Rock continues hard.

COMMONWEALTH.—100-foot level: Joint crosscut from south drift, to connect with upraise from 150-foot level, has been extended 35 feet, passing through some very rich ore with seams of ore still in the face. The joint upraise to intersect joint crosscut has been extended 9 feet, the top showing fine ore. The north intermediate is being opened up and is developing very rich ore. 150-foot level: No. 3 north drift from east crosscut has been advanced 12 feet following the vein, giving low assays, looking very favorable for ore when crosscuts are run. No. 1 north drift from No. 1 west crosscut has been advanced 20 feet. No. 2 winze from east lateral drift is down 10 feet and showing very fine all across the bottom. Joint crosscut to connect main south drift with east lateral has been extended 19 feet, face being vein matter. The 225-foot level has been extended 18 feet, the face showing the same as east lateral 150-foot level. Assays show \$230 per ton. The dump at bottom of shaft has been finished. Work at the new mill is progressing very favorably; large amount of contractors' freight arriving.

NEVADA QUEEN.—The joint crosscut from south drift, 100-foot level of Commonwealth, has been advanced 35 feet, cutting some high-grade ore, which will be opened up as connection is made with the upraise from 150-foot level, which has been extended up nine feet, showing good ore. Joint crosscut 150-foot level has been advanced 19 feet, face being in vein matter, showing some mineral. Good progress has been made in the joint upraise from 450-foot level and will reach the 350-foot level within a few days. The stopes are looking well and yielding a full supply for the mill. Assays for the week average \$102 per ton. Shipped Monday, bullion, estimated value, \$20,300. The mill is running nicely and doing good work. Average assay of 350 carloads of concentrating ore hoisted during the week show \$22.95 per ton.

NORTH BELLE ISLE.—East crosscut No. 2 north, 300-foot level, extended five feet; rock looks favorable but is very hard. Good progress has been made in the joint upraise from the 400-foot level. The stopes have yielded the usual amount of ore. The concentrator is awaiting the arrival of the water company's pipe line. Good headway is being made with the grade for the Union mill. The stonemasons and millwrights have arrived and the work of construction will soon be under way.

NAVAJO.—Crosscut from south drift, west vein, 350-foot level, extended 10 feet. Crosscut from south drift, west vein, 150-foot level, extended 10 feet. The stopes on the 350-foot level continue to look well and are yielding high-grade ore.

FOUND TREASURE.—Northeast crosscut from near the face of southeast drift, on southwest vein, 150-foot level, has been extended and timbered 15 feet. Southeast drift 200-foot level, has been extended and timbered 30 feet.

NORTH COMMONWEALTH.—The combination shaft has been sunk and timbered to ore. The rock continues hard, but looks favorable for ore.

GRAND PRIZE.—No work being done in the mine. Water being hoisted at the rate of 400,000 gallons per day.

BELLE ISLE.—Crosscut from north drift, 250-foot level, extended 10 feet. Rock quite hard, but breaks well.

ARIZONA.

NOTES.—*Prescott Courier*, Sept. 19: There are 20 miners working at and near the Dosoris mine. Mr. Pace, of Hassayampa district, tells us that there are about 200 miners at work there. If our miners could get their low-grade ores worked at a small profit, they would be happy and the country would be very prosperous. Sam F. Powell and others exhibit excellent ore from the new district below Walnut Grove. Rudd & Helly, of Florence, Nebraska, will soon be here to try their dry concentrators. Ore from the Howard mine, ten miles south of Prescott, is yielding \$1000 a ton, in gold. So we are informed by its owners, Messrs. Harlan & Barrington. They were here Saturday last and banked nearly \$5000 in gold, which they had crushed out of their rock in a 2-stamp mill in less than a month. They have connected their tunnel with the shaft, have 200 tons of ore in sight that will mill \$1000 a ton. They will add a concentrator to their other machinery. The Senator mine in same section is full of promise. Carmichael Bros., of Joe Walker district, have struck it rich in a new ledge, which is near the Farnham mill. Not much work has, as yet, been done in this ledge; top rock assays \$678.24 in gold and 250 ounces silver to the ton. Frank Foster, of Robeson & Foster, owners of the Middleton mine, Big Bug district, arrived yesterday. He is shipping a carload of high-grade ore through the Arizona Ore Company; has several tons at Van Name's mill. Three wagon-loads of high-grade sulphuret ore have recently arrived from the Congress mine. The ore works have all the ore they can handle, and as a miner who came here recently from the great Homestake mine said: "No other country save Arizona could furnish so much high-grade ore as has been shipped from here since the advent of the railroad and the sampler."

MOHAVE NOTES.—*Miner*, Sept. 22: A good many mining locations are being made to the San Francisco district. Miller & Hitchcock have a lease on the Short Starter, H. P. Ewing's new discovery in Peacock mountain. There are several sales of mining properties on the tapis, and we hope to record their conclusion before many weeks. Chas. Gross has about a ton of copper concentrates at the Sampling Works, and intends bringing in a carload. The concentrates go well up in gold and sil-

ver. The Elkhart mine near Chloride, a lead property, is being worked by Colorado parties. The ore is being shipped to the Pueblo smelters, presumably for flanking purposes. The Cupel mine is still in wonderfully rich ruby silver and will soon make a shipment of several carloads. The Cupel is likely to prove a big bonanza to the present lessee, John K. Mackenzie. With silver at \$1 and lead at \$5, Mohave county would soon stand at the head of Arizona counties as a producer of these ores, and all the camps in the county would take on a new lease of life. J. C. Potts has a lease on the old Cupel at Stockton hill, and has done about three weeks' work on it. He reports that a small streak of ore has been struck with every prospect of its widening out. The San Francisco mining district is coming to the front. Dan O'Leary has made a rich strike on the Old Hardy mine on Silver creek. The streak is a foot wide, and assays made give a return of \$90 in gold and \$120 in silver.

BRITISH COLUMBIA.

MACMURDO DISTRICT.—*Donald Truth*, Sept. 15: John Hepburn has men at work on the Chief of the Selkirk and is well pleased with the outlook, that claim and the Bobby Burns showing up fine. The Calgary Co. already has a tunnel in over 40 feet on the Monitor, and are satisfied with the showing.

PORCUPINE CREEK.—Things are moving along slowly but surely on Porcupine. The Discovery Co. has taken out between \$500 and \$700 for their five weeks' work, which includes the time engaged in building cabin, whipsawing lumber, making sluice-boxes, turning creek, and doing other preparatory work. They are now sluicing from the middle of the creek-bed with good results. The Sprague Co. struck bedrock at a depth of five feet, and had a very satisfactory cleanup. The Horseshoe, Donald Placer, Michigan and French Companies, after making surface cleanups, are sinking shafts, hoping to strike bedrock within 25 feet. Twenty men are at work.

WORK PROGRESSING.—Mr. Davis, who is in charge of the Monarch Co.'s properties near Field, was in Donald one day this week, accompanied by Mr. DeVolf, the gentleman who first bonded the properties from the Coffmans. They said that development work was in a forward state, and that as soon as the tramways were completed ore shipments would begin. All the machinery for the company's smelter at Vancouver is on the ground.

A RICH STRIKE.—W. J. Irving came up to Donald on Monday from the Big Butte district, where he has several promising locations. He brought in some rich specimens, which look as if they would go way up in the thousands—much resembling Toad-mountain ore. Big Butte is four miles from the Columbia river by Jubilee landing.

COAL.—J. M. Kellie and Harry Estelle have made a discovery that, if banded right, will make them the Dunsmuirs of this section. Some six miles southwest of Golden they have located a coal mine. The seam is 21 feet in width.

NEARING THE OLD CHANNEL.—Advices from Fort Steele are that the Perry Creek G. M. Co.'s drift is nearing the old channel, as several small nuggets have been found in the face of the drift.

COLORADO.

FROM DIFFERENT CAMPS.—*Silverton Miner*, Sept. 18: Capt. Walker has started a new tunnel in his Ophir mine, which will cut the Caribou streak at least 125 feet deep. A 100-ounce gold brick from the Suffolk was brought to Silverton by way of Telluride this morning. J. F. Steinback is working a force on the Bon Homme, near Animas Forks. The property is one of the most promising in that district. The new ore body in the 7th level of the North Star on Solomon has widened out to seven feet of solid gray copper. This is the biggest thing in the San Juan. Capt. Kendall and Rich. Lambert have this week shipped 15 tons of gold quartz from the Mabel to Perry Fisher's mill at Gladstone for a trial run. The result of the cleanup after a run of 25½ tons of Suffolk ore was 100 ounces of gold. The Suffolk mine at Ophir is showing up better than ever. During the coming week 40 tons of ore will be treated, and even better results are expected. The Gold Prince is the wonder of Cement creek. The lessees, Messrs. Eliot and Haynes, have been extracting ore steadily since they began work, and in sinking a shaft five feet have taken out a ton of high-grade mineral. The Nevada mine at Ophir, under the lease and management of Bell & Hunter, is again to the front as a shipper of first-class ore. A streak of gray copper averaging six inches wide and running 200 ounces of silver, is almost continuous through 150 feet of stopping ground. Two carloads were jacked over to Burro Bridge this week. The Whale five-stamp mill is exceeding the expectations of its owners. Thousands of tons of ore, which without milling facilities were worthless, can now be treated at an enormous profit. Mr. Horace Brock, one of the owners of the Mountain Queen, made an inspection of the mine this week and was very much pleased with the outlook. The mineral is getting wider every foot advanced on the drift, and from a specimen brought down to this office, it looks very rich. A large number of improvements will be made immediately, including a new house, electric-light plant, etc.

DAKOTA.

SILVER BULLION.—*Deadwood Pioneer*, Sept. 17: We learned yesterday that the miners at the Silver Bullion were laid off for an indefinite time. This action upon the part of the management was deemed necessary for the reason that the mine is now fully developed. The ore bodies are exposed at numerous places and assays from the different parts of the vein have established the value. The vein, which is lateral, is tapped at one place by an 80-foot tunnel, at which point it is 40 feet thick. It is likely that negotiations for a plant will soon be consummated with Eastern parties.

FLOAT.—The Buxton is one of the best paying properties in Ruby. Last summer it shipped ore enough to Omaha to pay all expenses and a dividend of 50 cents per share besides. The Buxton is making regular shipments of ore to Omaha this season. The Spanish R. and Adelphi have been making regular shipments of ore to Omaha this season. The mines are looking well and there is considerable ore in

sight. A rich strike in the Equitable was reported in town yesterday. This is a new company that was organized a few weeks ago in the Ruby basin district. The property is well located, being in the immediate vicinity of the Retriever. Supt. John McVean of the company has had a force of men developing the ground during the past two weeks, and yesterday rich ore was struck, averaging \$20 to \$25 per ton.

IDAHO.

CEUR D'ALENE.—*Wardner News*, Sept. 17: The Palmer Fraction, located south of the Sierra Nevada mine, is owned by Kennedy Hanley, W. A. Kenney, Frank R. Moore and Charles Sweeney. They commenced work on the property last February and have since that time expended \$13,000 in its development. Recently their labor and expenditure have been rewarded by their finding the vein at a depth of 125 feet from the surface; it is six feet in width and appears identical in character with a similar display in the Sierra Nevada mine. The owners intend immediately putting in hoisting and pumping machinery.

HUNTER MINE.—From all appearances a lively time will soon be inaugurated at the Hunter mine. Mr. Ryan informed a *News* reporter that the machinery is all ordered from Fraser & Chalmers' foundry at Chicago and will be shipped to Mullan at an early day. X. S. Burke is at present engaged in making a survey of a location for the millsite and also for the water ditch and tramway that is to be constructed from the mine to the mill. The capacity of the concentrator will be 150 tons per day, but a mammoth building will be erected capable of accommodating additional machinery and increasing the above figures as required.

EVOLUTION DISTRICT.—Work was resumed on the Argentine mine on the 5th inst. An increased force of men will be employed in a few days, as it is the intention of the owners to push work vigorously this fall and winter. Hoisting works have been ordered. The Bismarck, one of the most promising locations on Big creek, is owned by G. W. Sparenberg and H. Gerhardt. They have a tunnel in 100 feet which they are now extending on a good showing of galena ore.

BEAVER DISTRICT.—Five more promising locations called the Monitor, Amazon, Manhattan Fraction, Grouse and Grouse Fraction, form what is known as the Grouse group on Carbon creek. Work is progressing on the Grouse and Manhattan Fractions, and the owners, J. H. Smith and F. M. Franks, are highly elated with the development made.

HUNTER DISTRICT.—Most encouraging news is daily received from all parties interested in mining on Hunter gulch. The Morning lode on Chloride hill is looking better than ever; the ore is holding out in quality fully equal to the expectations of the owners and is increasing in quantity every day.

MILGULCH.—"Doc" Hamblin will recommence work on the Milo Blue Blanket lode joining the Kellogg townsite. This claim is on the Elk creek belt and presents most favorable indications. The Stemwinder Mining Co. commenced this week shipping concentrates to Wickes, Montana.

MONTANA.

FLAT CREEK.—*Cor. Wardner News*, Sept. 18: I have just seen the result of four assays of ore taken from the new discovery of Hall, Jones and Frazer, on Flat creek, Montana, which is as follows: No. 1, \$93, 25 per cent lead; No. 2, \$57, 36 per cent lead; No. 3, \$120, 58 per cent lead; No. 4, \$268, 39 per cent lead. These assays were made by C. W. Wing of this place, and are an average taken from four feet of the vein as a test of its real value. The owners say they have a vein of iron 100 feet wide, from 18 to 20 feet of which shows nearly the same character of ore as that which they have had assayed. Flat creek is one and one-half miles east of Kennedy & Joyce's claim—the Grant—on Deep creek, and four miles from O'Rourke, on Spring gulch, and the Iron King and Queen mines. This new discovery, the Iron Tower, as it is called, is the most important of the many that have been made in the Spring gulch country this season. The boys say there was quite an excitement over their discovery when they came here to get their assays made, but that there will be a greater one when they return, as no one believed the ore would assay half as well as it does.

THE HELENA SMELTER.—The work of construction at this institution moves steadily onward, some 200 men working night and day. One stack is now about 100 feet high, and another is up to a height of 80 feet. An army of carpenters, masons and bricklayers are busy around the place working at the dust chambers on the main building, laying foundations and brick. It is expected that the first section of three stacks will be ready for business in about three months. All the main side tracks are now about completed, so that the handling of material used in construction is now much facilitated. The Smelter Co. will soon commence the purchase of ores.

REDUCTION WORKS.—*Stevensville Tribune*, Sept. 20: In July we stated that A. M. Holter's visit to the Curlew mine, in which he is largely interested, had its significance. Sure enough, a location for a concentrator, with a capacity of less than 50 tons per day, is being surveyed this week by I. O. Kennedy and party. The location is just below the shaft on the east end of the claim—a most convenient one, as water and wood are inexhaustible. Since July 20th nine carloads of high-grade ore have been taken from the mine and shipped to Wickes for reduction. Five cars will leave Victor this week and are now being loaded. Three thousand tons of low-grade ore, which will be worked by the new concentrator at a handsome profit, is now on the dump.

NEW MEXICO.

THE SITUATION.—*Kingston Shaft*, Sept. 18: The mining situation improves. Two mines have shut down on account of the large amount of ore in sight in order to give time to get more economical methods of taking out ore. The gouging and "gophering" process has been too common here, and mine-owners are beginning to realize that we have mines here, and that the costly ways they have been practicing in getting their ore to market is

costing them fortunes every month. The fact that no ore netting less than 30 ounces does not pay to take out, shows that something is wrong with our methods.

KEYSTONE DEVELOPMENTS.—The most important strike in camp after the Lady Franklin, if it is not indeed the most important which tend to solve the problem of whether ore is "deep down" in our camp, is the recent strike in the Keystone on the North Pehra. This mine is one of the oldest locations and has always contained ore, but no effective development work has ever been done on it until the present company took hold of it. The mines that have been opened on the same vein, viz., the Virginian and Templar, have shown up large as well as rich ore bodies. The highest workings in camp are the Iconoclast as far as levels have been taken, a little over 9000 feet high. The Templar shaft is 500 feet lower; the Templar tunnel is 635 feet lower; the Equator tunnel, in which the rich ore has been struck on the Templar vein, is 795 feet lower; the collar of the Keystone shaft is 965 feet lower than the Iconoclast shaft. These heights are really the ascent or fall of the mountain in a distance of about a mile, and along the vein. The deepest workings on the Keystone shaft are about 150 from the surface, which is about 115 feet deep counting from the mouth of the Iconoclast shaft. In depth the Keystone has the advantage, except in dumping facilities. The deep-ore find in the Lady Franklin is in a drift from the deep shaft 370 feet deep. The collar of this shaft is lower than any on the Bonanza hill proper. The late deep-down strike on the Keystone is 150 feet deep and 125 to the north in a drift, just under the bed of the creek. Ore all over the face of the drift. The main ore streak is from 15 inches to 2 feet wide. On the face of the drift, assays run from 50 to 500 ounces from average samples, no choice of picked assays.

UTAH.

REVIEW.—*Salt Lake Tribune*, Sept. 21: The week closes with good feeling in mining circles, lead high, silver rising, and the smelters in full blast. It is a pleasant contrast with the dullness and gloom of the past summer. The receipts of metals in this city for the week ending September 19th, inclusive, were to the value of \$149,394.12, of which \$82,004.96 was ore and \$67,389.16 was bullion. For the week previous the receipts of ore were valued at \$69,435.60, and of bullion at \$82,444.04, a total of \$151,879.64. The Ontario product for the week was \$43,355.76 from ore sales; no bullion. The Daly output for the week was 10 bars of fine bullion, 11,999.63 ounces. The Horn Silver is silent, though with the enhanced price of its products it ought to be making a showing. Fine bar receipts in the city for the week were to the value of \$11,951.83; base bullion, \$8600; copper matte, \$273.74. The Hanauer smelter produced during the week bullion valued at \$16,450; the Germania, \$28,564.42. Ore receipts here for the week were \$43,795.83 in value by Wells, Go & Co.; \$25,150 by McCorkick & Co., including \$1150 Queen of the Hills and \$4700 Crescent; and \$73,058.13 by T. R. Jones & Co.

PARK NOTES.—*Record*, Sept. 22: The third week's developments on the new strike by the leasers of the Woodside property are highly satisfactory to say the least. An incline on the vein at the discovery is down some 20 feet now, and the new ground between the walls is looking fully as well as could be expected. The formation looks as though it would be regular and permanent, and Messrs. Farish, Drake and Willmans have reason to believe that it will prove to be a contact vein, between lime and quartzite. Last week the formation at the new workings seemed to be considerably broken up, but as more depth under the surface was reached this unfavorable sign disappeared almost entirely. There are about 100 tons of ore now in sight, and some 50 tons, chlorides and carbonates, the average assay value of which is nearly \$100 a ton, are on the dump for shipment. The Woodside leasers' strike is proving to be a veritable bonanza, and little fear is now had about its permanency.

THE APEX'S OPERATIONS.—Mr. Fenton said that there was comparatively little of the Apex's ground along the vein opened up yet. Their connection with the Crescent gives a free circulation of air, but the great length of their tunnels, drifts and crosscuts has but little more than opened up the ore body so it can be worked advantageously without a compressor and other machinery. Fourteen men are now employed, and another shipment of about 50 tons is being made up. The Apex is in its youth, and it is believed that its best days of ore-producing are yet to come.

THE CRESCENT DRIVING AHEAD.—Sinking in the big incline shaft from the 230-foot point has not yet been resumed, because the flow of water is too great for the pump to handle effectively. As soon as a new and larger pump which has been ordered arrives and is put in place, sinking will be commenced again. The other parts of the mine yield the old average of ore and about 150 tons of first and second-class come down the tramway daily.

ON BONANZA FLAT.—Three new surveys in the last two days in Snake Creek mining district, and the locating of all the known fractions believed to be on the line of strike of the Daly, Ontario and Ancor, will settle conflicting titles so far as patents can do so. Much work will yet have to be done to open up the property along Bonanza flat and vicinity, but that it is the center of the mineral belt between Park City and the heads of the Cottonwoods, is as near a settled fact as anything can be.

WASHINGTON.

BIG GOLD DISCOVERY.—*Ellensburg Capital*, Sept. 20: Mr. Meagher, who has been engaged in mining on the Swauk, cleaned up \$1400 in nuggets and fine gold. Among the nuggets was one weighing 564. He informed the *Capital* that he had traced the float and had discovered a fine ledge, in connection with Mr. Black, which was regarded by them as the long-sought mother lode. They first discovered decomposed quartz which showed from 200 to 400 colors to the pan, and after going through this they struck what they regard as the ledge. This ledge is free-milling and will assay about \$80 to the ton. The gold discovery is within 25 miles of Ellensburg and almost within sight of the railroad. It is regarded as one of the most important discoveries ever made in Kittitas county.

THE DOUBLE "ECONOMIC" STAMP MILL.

We have here the Stamp Mill in a cheap and simple form. The high drop of the old stamp is more than compensated for by the great weight (1200 lbs. each) of our stamps, and the rapidity (300 strokes each per minute) with which they run. There are 4 shoes in each stamp, so that there are 4800 strokes of the shoes on the dies per minute. Less power is required than in any other mill to do the same amount of work.

The Mortar has screens at both ends, giving ample discharge. There are no cams or tappets to wear or be adjusted. The stamps adjust themselves as the shoes wear.

AN AUTOMATIC ORE FEEDER

Goes with each Mill. We also have a suitable

Rock Breaker.

Several Mills are now in the mines doing excellent work. The "Economic" is not only a mill for small mines, but we believe it is destined to SUPERSEDE THE OLD STAMP IN MILLS OF THE LARGEST CAPACITY.

TATUM & BOWEN,

34 and 36 FREMONT STREET,

SAN FRANCISCO, CAL.

Manufacturers of Mining and Sawmill Machinery, Engines, Boilers, Etc.

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; is in successful operation and we guarantee its work as represented.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

Books on Working Ores.

By GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1880.

This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, \$3, coin, postage free. Sold by DEWEY & Co., Publishers, 252 Market St., San Francisco, Cal.

By C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant, 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, \$3. Sold by DEWEY & Co., S. F.

H. H. H. HORSE LINIMENT.
FOR MAN OR HORSE.
P. O. BOX 1888.
THE H. H. H. Horse Liniment puts a new life into the Antiquated Horse! For the last 14 years the H. H. H. Horse Liniment has been the leading remedy among Farmers and Stockmen for the cure of Sprains, Bruises, Stiff Joints, Spavins, Windgalls, Sore Shoulders, etc., and for Family Use is without an equal for Rheumatism, Neuralgia, Aches, Pains, Bruises, Cuts and Sprains of all characters. The H. H. H. Liniment has many imitations, and we caution the Public to see that the Trade Mark "H. H. H." is on every Bottle before purchasing. For sale everywhere for 50 cents and \$1.00 per Bottle.

For Sale by all Druggists.

"WHEELER PROCESS"

Working Refractory Gold and Silver Ores.

We are now prepared to receive Ore at our Testing and Mining Mill, Meriden, Conn., in sample lots of 500 pounds, to be worked by the Wheeler Process, where we have succeeded in saving 90 per cent of the metal contained in the ore.

We work sample lots free of charge and report results.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

MARKET REPORTS.

Local Market.

SAN FRANCISCO, Sept. 27, 1888.

SILVER—The sudden advance in London, in which New York and San Francisco sympathized, was caused by Russia entering the market as a buyer for coining. Although not purchasing heavily, the movement was enough to cause large operators to take a hand, under whose buying the price was run up to a higher figure than for over a year past. With Russia withdrawing from the market, holders began to offer more freely, which caused a decline. In our market prices were advanced in sympathy with New York and London, but at the higher quotations business was slow. Yesterday and to-day there is more inquiry and sellers have no difficulty in placing any sized parcel at from 93 1/2 to 94 1/2.

Silver closed to-day at 93 1/2 c in New York. In this city holders asked an advance. London cables came through higher, but weak in the advance.

QUICKSILVER—The movement is of a steady character, but, as usual for the season of the year, light, although an increasing call is reported, due to the early resumption of crushing by many mills forced to idleness for the lack of water-power. Distant mining centers are beginning to draw more freely. The market is quoted at \$45 net cash.

PIG IRON—Importations have been very heavy, but the market absorbs all as soon as received, which causes importers to have confidence in the future. The market closed firm at quotations.

PIG TIN—The market for spot is inactive but firm. For forward delivery there is a fair inquiry, but sellers' firm views, it is said, restrict transactions.

PIG LEAD—The market has a firmer tone, but buyers fight against any advance. They only take freely when concessions are obtainable.

COAL—Importations the past fortnight aggregate over 50,000 tons, but even with this large arrival the market holds strong at full prices, owing to a continuance of the strike in the Australian collieries. The number of vessels en route from Newcastle is as follows: For this port, 17; for San Pedro, 2; for San Diego, 5. Total, 17, with a registered tonnage of 19,507, equal to a carrying capacity of about 32,000 short tons.

Eastern Metal Market.

By Telegraph.

New York, Sept. 27, 1888.—The following are the closing prices the past week:

	Silver.	Lead.	Copper.	Tin.
Friday.....	96 1/2	84 1/2	17 65	\$23 45
Saturday.....	96 1/2	84 1/2	17 65	23 50
Monday.....	94 1/2	80 1/2	17 65	23 60
Tuesday.....	94 1/2	80 1/2	17 65	23 60
Wednesday.....	93 1/2	80 1/2	17 65	23 70

The market closed as follows: Copper, dull; lead, steady; tin, moderately active and firm at a slight advance.

By Mail.

The following is the latest from the "New York Metal Exchange Market Report":

COPPER—Dull, but a shade higher, spot closing at \$17.25. Transferable Notices (Lake) issued at \$—@—.

LEAD—Firm but quiet at \$4.95 @— spot. Transferable Notices issued at \$—@—.

TIN—Steady at an advance at \$23.20.

Prices generally ruling for metals not regularly dealt in on call at the N. Y. Exchange, covering extremes of buyers' and sellers' views. All prompt delivery. Australian Tin, @—; Billiton Tin, @—; Banca Tin, @—; Baltimore Copper, \$16.65 @—; Orford Copper, \$16.00 @16.25; P. S. C. Copper, @—; Foreign Lead, \$5.00 @5.25; Foreign Spelter, \$5.40 @5.60. Antimony, \$9.75 @13.60.

The Philadelphia market is reported as follows by the New York Metal Exchange Report:

PIG IRON—The demand is quite active, and almost everything is held for higher prices. A few scattering sales are still reported at the old prices, but there is no doubt that the general market is firm with an advancing tendency.

MANUFACTURED IRON—Prices are all tending toward higher figures. The advance in raw material, and the liberal amount of orders on hand, cause sellers to feel that they must get more money for their products, hence a disposition to ask extreme figures on all new business.

OLD RAILS—Quotations from abroad come so much higher that sellers are afraid to name prices, but \$24 would probably be paid for the best.

SCRAP IRON—Bid of \$21 are made for cargo lots October or November shipments.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in DEWEY & Co.'s Patent Office Library, 220 Market St., S. F.

FOR WEEK ENDING SEPT. 18, 1888.

389,734.—MICROMETER CALIPERS—James D. Bishop, S. F.	
389,639.—NUT LOCK—H. F. Corey, Alameda, Cal.	
389,641.—ASBESTUS PAINT—F. DeConinck, S. F.	
389,697.—FRUIT-GATHERER—C. A. and C. F. Fleming, San Jose, Cal.	
389,653.—ROLLER BEARING—R. W. Hent, S. F.	
389,703.—PERMUTATION LOCK—Chas. Hill, Los Angeles, Cal.	
389,659.—RIDING SADDLE—D. R. Lakin, Eugene City, Oregon.	
389,620.—TURN-TABLE FOR STREET RAILWAYS—J. W. Warhurst, S. F.	
389,623.—HORSE-POWER—W. H. Williscraft, Juniper, A. T.	

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

MICROMETER CALIPERS—James D. Bishop, S. F. No. 389,734. Dated Sept. 18, 1888. This invention relates to certain improvements in devices for delicate measurements, and its object is to enable calipers for mechanical use to be adjusted with absolute precision to the smallest variations of measurement. It consists of a standard steel or metal rule divided to any desired scale, with a movable attachment eliding upon the scale, with grooves and set-screws facing right and left, the faces of the grooves being in the same vertical plane, and a spring-piece bent at right angles with the eliding piece, to which it is attached so that its edge may sink into any of the divisions of the rule and hold it in place. To the opposite end of the rule is fixed another metal piece having a movable portion with grooves corresponding to those on the first-named piece, and a micrometer or vernier screw by which it may be advanced or retracted.

FRUIT-GATHERER—George A. Fleming and Charles F. Fleming, San Jose, Cal. No. 389,697. Dated Sept. 18, 1888. This invention consists of a wheeled truck, wagon or sled, which may be or may not be provided with packing boxes for the fruit, and to which truck the gathering cloths are permanently secured. These cloths are attached to one side of the truck, and are adapted to be spread beneath the tree from which the fruit is to be gathered. There are two of these cloths, so that they may be spread on each side of the trunk of the tree. When spread beneath the tree, the tree is shaken and the fruit falls upon the cloths, and when all the fruit is shaken from the tree, the free ends of the cloths are lifted up higher than the edge of the truck, thus permitting the fruit to fall into the truck or the packing-boxes. The truck is then moved to the next tree, the cloths are respread, and so on until the gathering is completed or the truck is full. When not spread beneath the trees, the cloths are laid across the top of the truck, thus protecting the fruit from dust. This device being particularly designed for gathering prunes, the cloths are laid directly upon the ground, the prunes not being injured by falling.

THE FIRST CORLISS ENGINE—B. H. Thwait, in a lecture recently delivered in England, read the following letter from George H. Corlies, written a few days before his death: "The 17th of this February of 1888 is the fortieth anniversary of the starting of my first engine having the regulator combined with the cut-off valves, which was the first application ever made in practical form of this mode of regulation. This engine was of the walking-beam type, and was developing a capacity of 260-horse power during the first minute of its automatic regulation of the closing moment of its induction valve. It was constructed throughout with reference to the introduction of this new feature. The cylinder was 22 inches in diameter, and had a stroke of 6 feet, and worked under 60-pound hoiler pressure. This was my first effort, which has since culminated in giving the generic name to the Corlies engine."

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Nevada Queen, Sept. 22, \$20 300; Eureka Con., 21, \$17 200; Bluebird, 18, \$16 000; Tucarora, 21, \$3000; Hanauer, 20, \$1950; Germania, 20, \$2679; Hanauer, 21, \$3300; 22, \$2200; Germania, 23, \$4923; Hanauer, 23, \$3400.

W. H. GILBERT of New York is developing a coal mine at South Riverside. A shaft has been sunk to a depth of 240 feet, and the coal, according to experts, is of a very superior quality.

Mining Share Market.

The mining share market has been so very dull and inactive for so long a time that few people interest themselves in it. What fluctuations occur are very small. The Virginia Enterprise says: Men of small means who have put their money into stocks are now being made sick by assessments. In trying to make a two-bit turn not a few among them have caught a four-bit assessment. Before people will go in with any sort of nerve, something must occur to send stocks up to a point where they will be above the level that makes a 50-cent assessment a factor—a thing to be feared and constantly borne in mind. When fluctuations amount to two or three dollars, dealers do not much bother themselves about an assessment of 50 cents, but at the present stage of the game a 50-cent assessment may etick a stock upon a man who does not want it, and who would much rather have his money in hand again.

This uncertain condition of the market will probably continue until the milling of ore is fully resumed by the several productive mines of the lode.

The indications at present are that milling will be resumed earlier than usual this season on the Caroon River. Already we have had a rain that gave life to the mountain tributaries of the Caroon river, and in that stream itself there was for a day or two a considerable flow of water—enough to have driven 20 stamps of the Eureka mill had it been thought worth while to start them up. The life given to the mountain tributaries they will not lose until there shall be other rains or snow. A few inches of snow in the mountains would mean business with the river mill.

The ore-producing mines are looking well, and in all, considerable bodies of ore are opened up ready for extraction.

During the time that the mills have been shut down much necessary repair work (as well as much work of exploration) has been done in all the leading mines. The drifts in the principal levels have been put in order and retimbered, and there have been repairs made to the main shaft.

A PECULIAR INDUSTRY—Among the various industries which are comparatively but little known beyond their specialty, that of the product of the castor bean may be mentioned as one of the most unique. The oil is especially adapted for lubricating all sorts of machinery, clocks, watches, etc., and it is an excellent lamp oil, giving a white light far superior to that of mineral oils, petroleum, rapeseed, linseed and all other oils, whether vegetable, animal or mineral; it also gives very little soot, and, all things considered, has been pronounced the cheapest oil known. All the great perfume of London and Paris use castor oil for the manufacture of golden oil, so well known for its property of keeping the head cool and the skin and its pores, as well as the roots of the hair, soft and open. The oil is used for textile fabrics to fit them for dyeing or printing, for which purpose the India dyers and printers invariably employ it, and it is one of the best oils for dressing tanned hides and skins of all kinds, on account of its imparting to them such a degree of strength, durability, tenacity and beauty. From the oil-cake, in addition to its other uses, a gas is obtained which gives a superior light, some of the stations on the East India railway being illuminated this way. The oil dissolves completely in alcohol, and this, incorporated with a solution of copal, makes a varnish which, it is said, is very useful in polishing all kinds of first-class furniture, carriages, picture-frames, cloths, canvas, etc.

HUNDREDS of lives were lost in the floods in the Province of Almeria, Spain, and many persons are ruined, their entire possessions having been swept away.

The Debris Commission.

The debris question will be thoroughly investigated by a Government commission, notwithstanding the efforts of interested parties to prevent a proper examination of the subject. The bill appropriating \$100,000 for inquiring into the question in this State has passed and only awaits the President's signature to become a law. The bill is as follows:

Be It enacted by the Senate and House of Representatives of the United States of America, in Congress assembled, that the Secretary of War is hereby authorized to detail three officers from the Engineer Corps of the United States, as a commission for the purpose of making an examination and investigation of the mining-debris question in the State of California, for the purpose of ascertaining whether some plan can be devised whereby the present conflict between the mining and farming sections may be adjusted and the mining industry rehabilitated; and for a complete examination of the injured navigable river channels, their tributaries and lands adjacent thereto, with a view to the improvement and rectification of said rivers; and that the sum of \$100,000, or so much thereof as may be necessary, is hereby appropriated, out of any money in the Treasury not otherwise appropriated, for the purpose of carrying into effect the provisions of this Act, said sum to be expended at the discretion of the Secretary of War, said commission to report as early as practicable to the Secretary of War the result of their investigation, and the Secretary of War shall make a report thereof to Congress.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3.00 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Sampling Works for Sale.

The works are situated on A. & P. R. R., Calico Mining District, Daggett, Cal., and contain a first-class Engine and Boiler with Ore Crusher and other machinery, Platform Scales, Mill Scales, Assaying Outfit, etc., all nearly new. Also upon the premises an office building and a comfortable dwelling house (portable). The above can be had at a bargain. Apply to GILLESPIE & CHILDS, 123 California street, San Francisco.

Six men were arrested Monday near Tulare lake with a wagonload of venison. Twelve of the animals were found to be females. The prisoners were taken to Bakersfield, tried before Justice of the Peace Curran and fined \$518.

J. A. JOHNSON, 307 Montgomery street (the Nevada Bank building) is the general agent of the Stiles quartz machinery, and offers easy terms for introduction.

Books on Assaying.

BY C. H. AARON.

PART I.—Gold and Silver Ores.—Price \$1.

This new work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "universally popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of Dressing; The Melting in Crucibles; Scorching; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Crucible Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 106 12mo. pages, with illustrations, well bound in cloth; 1884. Price, \$1, postpaid. Sold by DEWEY & CO., Publishers, No. 252 Market street, San Francisco.

PARTS II AND III.

Lead, Copper, Tin, Mercury, etc.

Price \$1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assays; Parkes' Process; Amalgamation; New Process; Preparation of Potassium Cyanide; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores; New Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Salt; Appendix to Part I; Notes on Crucible Assays; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

There are 160 12mo. pages with illustrations in the volume which is bound strongly in cloth. Price postpaid, \$1.75. Sold by DEWEY & CO., Publishers, No. 252 Market St., S. F.

STORAGE

We have some extra room suitable for storage purposes, which we will let on very reasonable terms.

Dewey & Co.'s Scientific Press
Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, titles of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

GIANT POWDER or DYNAMITE,

Of Different Strengths as Required

NOBEL'S EXPLOSIVE GELATINE, which contains 94 per cent of Nitro-Glycerine, and GELATINE-DYNAMITE, Stronger than Dynamite and even Safer in Handling.

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

\$1,000 CHALLENGE!

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS (\$575.00) F. O. B.

OVER 1400 ARE NOW IN USE. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at 220 Fremont Street, San Francisco.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.

DEAR SIR:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered twenty more of your machines for immediate delivery. Yours truly,

THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners having been started gave such satisfaction that 44 additional Frues and more stamps have been purchased.

ADAMS & CARTER.

Protected by patents May 4, 1890; December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883. Patents applied for.

THE FRUE ORE CONCENTRATOR OR VANNING MACHINE.

ADAMS & CARTER, Agents Frue Vanning Machine Co., Room 7, No. 109 California Street, SAN FRANCISCO, CAL.

\$1,000 CHALLENGE ACCEPTED, PRICE, FIVE HUNDRED AND FIFTY DOLLARS (\$550.00).

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocating motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

THE "TRIUMPH" ORE CONCENTRATOR.

JOSHUA HENDY MACHINE WORKS, Nos. 39 to 51 Fremont St., San Francisco, Cal.

COMPRESSED AIR and WATER POWER MACHINERY.

RIX & FIRTH, 225 and 227 First St., San Francisco.

NATIONAL AIR COMPRESSORS.

SINGLE OR DUPLEX, STEAM OR BELT POWER.
62 Sold on the Pacific Coast.

KNIGHT'S WATER WHEEL, —FOR— MILLS, PUMPING AND HOISTING.
Over 300 in use. All estimates guaranteed. Send for Circular.

MINERS' HORSE WHIM.

All wrought iron. No gears, no breakage. One horse will easily handle rock or water to a depth of 350 feet, giving entire satisfaction to the prospector. Price, complete, \$200. 150 sold on this Coast.

NATIONAL ROCK DRILL.
200 Sold on this Coast. Has less repairs than any other Drill.

Liberty St.
New York.

THE RAND DRILL COMPANY, 23 Park Place, New York.

We are now so situated with our new works as to offer to the miners of the Pacific Coast SMALL AIR-COMPRESSING PLANTS at such prices that almost any small mine can afford to put in power drills if they have none in use.

By our NEW AND PATENTED SYSTEMS (by which the duty or performance of drills is not reduced with use) it is no longer necessary

PLANTS IN THIS COUNTRY, and has patterns for all sizes up to 40-inch diameter of cylinder. In respect to capacity IN SPEED OF DRILLING, perhaps it is in order to say that in EVERY AUTHENTICATIVE CONTEST for speed yet initiated, the RAND DRILLS have, without exception, BEEN VICTORIOUS. This fact, coupled with another important one, that the drills use much LESS AIR and cause LESS REPAIRS, has won for them nearly all of the Eastern mining trade, which has kept their works always busy.

Since the reasons which formerly restrained us from the California market no longer exist, we are now in the field for the business.

SPECIAL ATTENTION is called to the latest designed sectional Compressor just built for the Batopilas mine in Mexico, and to the Compound Engine Compressor built for the Anaconda mine in Montana.

ROCK DRILLS AIR COMPRESSORS & GENERAL MACHINERY FOR MINING, TUNNELING, QUARRY & RAILROAD WORK.
RAND DRILL CO 23 PARK PLACE NEW YORK

to buy a Compressor of double capacity than the drills are expected to require, in order to keep up the supply of air necessary on account of the wear of drills and compressor.

Besides having THE NEWEST AND LIGHTEST designed small drill plants, the Rand Drill Company, as is well known, has built, and is now building, the LARGEST COMPRESSOR

THE LIXIVIATION OF SILVER ORES WITH HYPOSULPHITE SOLUTIONS

(With special reference to the Russell process),

BY C. A. STETEFELDT.

Something About Elevators.

NUMBER 1.

There are probably few who are accustomed to frequent hotels and the large public buildings of our cities, and ride from story to story in the swift, silent elevator, have any idea of how short a time ago it is since these now indispensable conveniences came into general use. Although steam freight hoists have been known for half a century, it is only about five and twenty years ago since the first passenger elevator, or "vertical railway," as it was then called, was constructed for the Fifth Avenue hotel in New York, and later for the Continental hotel in Philadelphia.

These machines, which rendered both hotels famous for years, were very clumsy, and in appearance altogether different to the elegant cars that now adorn our various large establishments. Those who saw them years ago will remember that the middle of the car was taken up by a large vertical cylinder sheathed in wood. Inside of this cylinder revolved an enormous screw extending from top to bottom of the shaft, and in the threads of this, which were set at a low pitch, were engaged strong projections from the inside of the cylinder in the car, so that as the screw was revolved by the engine below, the car strung up upon it like a nut upon a bolt. This cumbersome and costly apparatus kept the field to itself for some time, until public opinion had so far changed that people were willing to trust their lives to the strength of wire ropes and enspined elevators. Being of moderate cost, their use rapidly spread until now there are few buildings without an elevator of one description or another.

The shaft as commonly constructed in this country consists simply of holes cut in floors, one above the other, and furnished with two upright timbers to serve as guides for the car. These posts are usually arranged for passenger elevators in opposite corners of the opening, as this gives opportunity for access to the car on all sides. For freight hoists of large size it is better to place them in the middle of the sides.

The guide timbers should be perfectly straight and plumb and of seasoned strength, for in case of accidents to the enspining ropes, which are always liable to happen from various causes, the whole weight of the platform or car is suddenly thrown upon them by the safety clutches, and any weakness of joints or crookedness in the timbers which should prevent the instant and effective action of these would insure its destruction.

Hard pine is very commonly used and is perhaps the best wood for the purpose. With regard to the posts, if 8x8 inches in section are too long for single eticke, they may with advantage be built up of 4x8-inch pieces, breaking joint in the middle of their length, and bolted. This will give a practically solid piece of timber from bottom to top of the shaft, independent of the floors, and is much better than the common construction of short lengths of whole timber huddled together and kept in line only by aid of the beams which surround the hatchway.

The San Francisco Tool Co. are the manufacturers of a patent hydraulic elevator of double capacity, as shown in the accompanying illustration. This hoisting machine is a double-acting hydraulic engine which makes one stroke while the car rises its full height. It has but one cylinder of cast iron, and one plunger and piston. The smaller machine is used only when

required at any part of the stroke and gives increased power. The cylinder is either horizontal or vertical. Two hoisting ropes attach to the car, and each rope has an independent connection and is attached to an equalizer, so that each bears its portion of the load. The stroke of the machine is generally one-tenth the rise of the car.

By using but one cylinder a saving in friction

has two different capacities, one for a heavy load and one for a light one, the water being divided into two parts by valve arrangement, and only used in quantity sufficient to supply the adequate amount of pressure for the load.

There is one other feature about the Tool Company's elevator, and that is its patent automatic lock or regulator, which prevents a waste of water, by avoiding the use of the larger

DOUBLE HYDRAULIC ENGINE FOR ELEVATORS.

is made, and also less complication of parts. The cylinder has a head at each end, which prevents the constant moisture around the machine from leakage when the packing of the piston becomes worn.

The valve chest is fastened to the cylinder, and has a cover which can be easily removed should an inspection of the valves be required.

The valves are of the poppet pattern with leather faces, which are held in place by rings which are screwed to the valves. They stand on bronze metal spindles, which are actuated by cams on a shaft, upon which is a shipper-wheel, to which the hand rope is attached.

The great thing claimed for the double capacity elevator is its economy in the use of water; it can be operated by water-pressure from the city main or from a tank in the upper story of the building.

It will be seen, then, that this make of elevator

capacity when the smaller capacity is sufficient for the load. The action being entirely automatic and dependent on the load in the car, it is impossible for an unskilled operator to waste the water by use more than is required.

The San Francisco Tool Co. also make a belt-hoisting machine for elevators, which is ingenious and effective. It is, however, dependent on steam for the motive-power and is generally driven by belts either from line or counter-shafts. The shaft has one tight and two loose pulleys, and the power is transmitted to the drum by means of a worm and gear which are inclosed in a cast-iron case of a self-lubricating character.

In concluding this brief description of this elevator, it may be proper to add that in planning a building the architect should carefully provide for everything connected with elevators when the plans and specifications are pre-

pared. He should decide at the outset just what he intends to recommend to his client and not leave such matters for after consideration. Thus all cutting and alterations will be avoided and it will not be necessary to modify or alter one kind of work in order to provide for another.

It is not the object to suggest the kind of operating machinery to employ, but this should certainly be decided early by competent judges, and when all is complete, a certificate that the work has been efficiently and properly carried out should be obtained from the architect before the work is paid for.

Lead and Silver Ores.

If the prices of lead and silver keep up for a while, or rise higher, many of the low-grade mines which have been closed down will again resume operations. Lead and silver have been quoted so low for such a long time that many miners had to quit work and others have been making nothing. The first effect of the gradual rise is shown in Salt Lake, where the smelters are now all busy. Ore is being crowded on the market and miners are in demand. Proprietors of smelting works interviewed by the *Tribune* of that city seem to be hopeful of even increased business.

A reporter asked Mr. McCornick how long he thought the business would hold up, and he said he thought there was no likelihood of any letting up until the prices on silver and lead declined. He said many of the low-grade mines had been shut down so long that it would take them some time to open up and begin shipping ore; hence he thought the supply would continue on the increase for some time yet. It was a healthful condition of affairs which would be a great benefit to the mining population of Utah and to business generally.

Mr. Jones said he had noticed a great increase in the supply, and also an increase in outside bidding for the ore who were endeavoring to run it out of the Territory. He did not know how long it would continue.

STAMPS AND POWER.—The system of wire-rope transmission of power to the California mill, says the *Virginia Enterprise*, is a positive success, and that mill will run 60 stamps steady and may possibly increase it to 80 stamps. The Brush Electric Company expresses confidence of being able to land 80 per cent of the power developed by the Pelton wheels in the Chollar shaft on the milling tools at the Nevada mill. This will assure the running of 60 stamps in that mill. The Brunswick's 76 stamps on the river have been put in good running order, and the Santiago's 25 stamps have also been repaired to stand a year of pounding. Then comes the Mexican, 44 stamps; Vivian, 16; Enreka, 60; Morgan, 40; Rock Point, 20; Gold Canyon mill, 30; Six-mile Canyon, 30; Alta, 10, and Justice 10—making a grand total of over 500 stamps, with an average crushing capacity of three tons each—or 1500 tons daily.

COAL is still and tending upward. Dealers express their conviction that this winter will see famine prices. The supply is very short. We receive on the average 50,000 tons a month from Australia at this port, and the strike there cuts off an important source of supply.

The Queensland mines have not come up to promise, and shares in England are at a discount.

Needed Mining Law Reforms.

When the honorable gentlemen who will constitute the next General Assembly of the State of Colorado have elected the United States Senator and completed the regular biennial wrestle with the railway lobbyists, there are two or three matters relating to the principal industry of the State which we hope may receive a little of their attention. One is a manner of regulating the working of mines in a way that will conduce to the health and safety of the employees. A second is the method of presenting expert testimony before courts, and a third is in relation to the establishment of a Mining Bureau and the appointment of a Commissioner of Mines.

There is need for something to be done in each of these directions. Every few weeks some miner is crippled or killed by an accident in a mine, which was caused by the neglect, ignorance or parsimony of the mine-owner or manager. He was only some poor, common laborer, whose friends are powerless to make any sensation in regard to the real cause of his death, and it goes on the record as one of the accidents incidental to and unavoidable in the miner's calling. If the State had an officer whose duty it is to examine the cause of such accidents and whose competency and honor would lead him to determine and tell the truth, without fear or favor, the public would occasionally learn some startling facts. As it is now, a coroner's inquest is seldom held, and when it is it often resembles a lawsuit in which there is an evident effort to hide something. There are numberless cases in Colorado mines where a score or several scores of miners are employed underground, with but one shaft through which they can reach the surface. A fire in the shaft-house would smother every one under ground in such mines. Certainly this is a risk that should be avoided whenever possible.

In the case of expert testimony, science is helied most shamefully. Under the present method of summoning expert witnesses, each becomes an advocate for the side employing him; and while he may not tell an untruth it becomes his interest to hide all the truth which is not favorable to the cause he is employed to assist. To present, as expert witnesses, the whole argument, pro and con, is not their recognized function. Expert testimony is now partisan; it should be judicial. Every one recognizes the evil, but it is not so easy to tell how best to remedy it. It might be best for the courts to appoint the expert witnesses, or at least to appoint some in addition to those appointed by each side, in order that court and jury could have some aid in forming an opinion from those who are unbiased and unprejudiced.

A mining bureau, whose duty it should be to collect and tabulate all obtainable information in relation to mines, mills, smelting works and process experiments, and to become in other respects like the Mining Bureau of California, would be of almost incalculable benefit to all who are interested in legitimate mining and who recognize the value of facts in relation to the business. It would not be of value to the dishonest mine-promoters and process frauds, and those whose interests are with them could not be expected to favor such a bureau.

There is a good deal, we well know, which can be said in opposition to such changes and regulations. They are almost all summed up in the statement that to carry out such measures would require the creation of new offices and the appointment of new officers, whose power would be great, and that dishonesty is so inherent in human nature that it is too much to expect any man would perform the duties fairly, without favor and without using his position to make money. Sugar-coat the objections as one may, these are what they are summed up in. If they are tenable then Widow Bedott told the truth when she said "we are all poor critters." But they are not tenable; the world is not all bad and there are a good many capable and honest men, though possibly the average legislator doesn't believe in any such a statement, which is not supported by observation of and acquaintance with his associates.—*Denver Mining Industry.*

THE QUALITIES OF A GOOD ROPE.—A German paper, in an article on the present methods of rope manufacture from hemp, and the determination of the different qualities and probable strength simply from the appearance, lays down the following rules: A good hemp rope is hard, but pliant, yellowish or greenish-gray in color, with a certain silvery or pearly luster. A dark or blackish color indicates that the hemp has suffered from fermentation in the process of curing, and brown spots show that the rope was spun while the fibers were damp, and is, consequently, weak and soft in those places. Again, sometimes a rope is made with inferior hemp on the inside, covered with yards of good material—a fraud, however, which may be detected by dissecting a portion of the rope, in practiced hands, by its behavior in use. Other inferior ropes are made from short fibers, or with strands of unequal length or unevenly spun, the rope in the first case appearing woolly, on account of the number of ends of fiber projecting, and, in the latter case, the irregularity of manufacture is evident on inspection by any good judge. A very simple and extremely ready means exists for ascertaining the purity or otherwise of Manila hemp rope. This consists in forming balls of loose fiber of the ropes to be tested, and burning them com-

pletely to ashes. While pure Manila hemp burns to a dull grayish-black ash, Sisal leaves a whitish-gray ash, combinations of Manila and Sisal yielding a mixed ash resembling the beard of a man turning from black to gray.—*Iron.*

Electric Transmission in Mining.

The *Virginia Enterprise* says: The dynamos that are to be set up in the "electric chamber" on the Suto tunnel level of the Chollar mine to generate the current for use on the motors which will drive the machinery of the Nevada mill, are now arriving. The wires and motors are all here. The water-wheels that are to drive the dynamos are being manufactured by the Pelton Water-Wheel Co., San Francisco, and are liable to arrive here any day.

Six Pelton Wheels to be Used.

An alteration of the plan first talked of has been made at the suggestion of Capt. J. B. Overton. It was at first proposed to drive the six dynamos by means of a single large Pelton wheel, but it was soon after decided to give each dynamo its special driving-wheel. The wheels to be used are of phosphor bronze. Each wheel will be 40 inches in diameter, and, with a stream of water flowing through a nozzle less than half an inch in diameter under a vertical pressure of 1630 feet, will develop about 125-horse power, or 750-horse power for the six wheels. The Brush Co., who furnish the electrical apparatus that is to be used, says it will transmit 80 per cent of this power to the machinery of the mill. The apparatus is now being put in place, both underground and on the surface.

A New Thing in the History of Mechanics.

When in operation, their works will be of great interest to engineers and scientists everywhere. Never before in the history of mechanics has an attempt been made to run motor wheels under such an enormous pressure. Those who remember the terrible force with which water was spouted from leaks and breaks in the first big inverted siphon laid across Washoe valley (that put in by Schusler) will be able to comprehend the meaning of a pressure of 1630 feet.

Mechanics will readily see the advantages that will result from having each Pelton and dynamo independent of the others, instead of having all on one shaft and all run by a single water-wheel. When the new works are in operation in the big station on the Suto tunnel level, they will constitute

A Subterranean Lightning Factory.

The like of which is to be seen nowhere else in the world. It will be the next thing to drawing electricity from the molten interior of the earth. Hereafter tourists will not only wish to descend the C. & C. shaft and see at work there the Pelton wheels from which the power developed is transmitted to the surface, and thence to the pan-mill (1600 feet distant) by means of steel-wire cables, but will also wish to descend to this lightning shop deep in the bowels of the earth, and there see the transmission of the power of the water-wheels by electricity.

Mining Statistics of Queensland.

In 1886 the total yield of the Queensland gold-fields was 340,998 ozs. In 1887 the yield was 425,923 ozs, or an increase of 84,925 ozs. In the northern division in 1886 the Charters Towers and Cape field produced 144,379 ozs., out of a total of 195,185 ozs., and in 1887, 151,377 ozs., out of 225,234 ozs. The most promising field, however, was perhaps the Croydon, where a production of 2144 ozs. in 1886 increased to 31,788 ozs. in 1887. The gold produced in the central division increased from 57,031 ozs. in 1886 to 93,969 ozs. in 1887, this improvement being entirely due to the Rockhampton gold-field (Mount Morgan), of which the output advanced from 49,086 ozs. in 1886 to 85,305 ozs. in 1887. In the southern division the yield for 1886 was 88,782 ozs., and 106,720 ozs. in 1887. Gympie produced 88,000 ozs. in 1886 and 102,149 in 1887, while the small fields of this division produced only 1882 ozs. in 1886, against 4487 ozs. in 1887. Of the total gold raised in 1887, 404,223 ozs. were obtained by quartz crushing and 21,700 from alluvial workings. There was a gross total of 9305 miners employed, of whom 855 were Chinese, who were mainly employed in alluvial mining. The average yield in 1887 per ton of quartz crushed was 1 oz. 1 dwt. 12 grs. In 1886 there was a total quantity of tin raised of 3153 tons, value 162,124L., against 3279 tons, worth 217,389L. in 1887, when, however, the market price was higher. Of silver and lead, 1631 tons were raised in 1886, worth 52,797L., against 2153 tons, value 80,092L., in 1887. There were 110 tons of antimony raised in 1886, but none in 1887; while of copper 900 tons, worth 7000L., were produced in 1886, against 1010 tons, worth 7600L., in 1887. Finally we come to coal, of which 238,656 tons were raised in 1886, value 95,243L., and 238,813 tons in 1887, value 97,460L. There were 2629 miners at work in 1887 on minerals other than gold.

At Griffin, Ga., a colony of black bees had been living peaceably near a tribe of Italian bees for years until a short time since, when the black bees attempted to rob their yellow neighbors. A fierce fight was the result, in which hundreds of the black robbers were killed.

Steam Engines in the United States Fifty Years Ago.

Just one-half century ago, in 1838, says the *Engineering Journal*, a census of all the steam engines of every description in the United States was taken. The work was done in pursuance of a resolution of Congress, the object apparently being to secure information upon which could be based a law for the regulation of steam; and it was, in fact, shortly after that time that the first general law in relation to the use of steam-boats was passed. The census was taken by the collectors of customs in the different districts, and appears from the report which was submitted to Congress, a copy of which is now in our possession, to have been pretty carefully done. It is curious to look over the figures now, and to contrast them with some of those for the present year.

In his preliminary statement the Secretary of the Treasury says that full reports have been received from all the States except Mississippi and Tennessee, in which two or three districts were missing; and that they were somewhat imperfect from the States of Illinois and Arkansas, and the Territories of Wisconsin and Iowa. An estimate was made, which is probably a very close one, for the missing districts, in several of which it is considered that the absence of returns was due to the fact that there was nothing to return; that is, that there were no steam engines there.

The summary, including estimates, informs us that there were in the United States 800 steamboats, 350 locomotives, 1860 stationary steam engines, but these were very unevenly distributed. The largest number of the stationary engines in any one State was in Pennsylvania, where 383 were found, some of them in factories, a considerable number employed as pumping and hoisting engines in the coal mines, which were already beginning to be an important industry. Curiously Louisiana stood second among the States in her stationary engines, having not less than 274, or about one-sixth of the whole number in the United States. At first sight it appears strange that a State which has never been known for its manufactories should have had—at that early day—so many engines, but this may be explained by two causes: One, that a large number of small engines were employed on the numerous sugar plantations of the State for crushing cane and similar purposes, and another being that in so level a region there is almost an entire absence of falls which can be utilized for water-power. Thus in Massachusetts, which was considered at that time the leading manufacturing State, there were found only 165 stationary engines; but this is not surprising when we remember that a large portion of the mills were run by water-power. New York was fourth on the list, having 87, while Ohio had no less than 83.

A WONDERFUL GOLD MINE.—Leadville has for years been chiefly noted as a silver-lead camp, but the Antioch, which is now fairly opened, will make the yellow metal an important factor in the output of the famous camp. In speaking of this property the *Leadville Herald-Democrat* says: "The Antioch mill runs regularly, doing the usual good work, and the mine produces the ore for it without interruption. The ore body in the Antioch mine is so immense that the 100 tons per day which are taken from it apparently makes very little difference. The ore is of low grade, but the enormous quantity makes the mine so valuable. The ore in the Antioch is probably mined cheaper than in any other mine in this country west of the Mississippi river. In the Antioch the principal cost is in the loading of the ore upon the cars and tramping to the surface. Some new cars of special design have just been ordered for the mine, which will make this part of the work easier and cheaper. The ore is broken from a breast 60 feet high and 50 feet wide. On the average, 200 tons of ore are dislodged at one firing. Now and then as much as 1000 tons and even 1500 tons have been broken down at one time. The ore is broken by a series of holes drilled 20 feet deep; they are loaded with No. 2 dynamite and fired by electricity. Experiments have been made with various kinds of powder. Black powder was found not to be so efficient as dynamite, because the quality of the porphyry rock was variable, and the slow black powder blew out the softest parts, and of course did not shatter the rock like dynamite. The great stope in the Antioch is carried directly to the surface, which is stripped of the wash and gravel. Two lines of snow fences have been built on the surface to protect the pit from snow in the winter. The walls of the vein are nearly vertical, and so far seem to stand without timber. In mining the Antioch ore there is no cost for timber, none for hoisting and none for pumping, which are three of the great items of expense in the operation of most mines. The Antioch should have a larger mill, and if this were built it would probably be one of the largest producing gold mines in this country."

FREIGHT ON ORES.—The reduction of shipping rates on ores shipped from Wood river has proven a great boon to that rich section of Alturas county. Last spring most of the mines of those districts were shut down, and the owners declared positively their intention of keeping work suspended until they were placed on an equality with Montana points as regarded

freight rates. Their plan proved successful, the railroad company yielding. As a result, many mines resumed working as soon as the new rates were announced, and several hundred miners were immediately put to work. From 100,000 to 200,000 pounds are now shipped daily from Bellevue, Hailey and Ketchum; everybody wears a bright smile and signs of prosperity are becoming manifest. The number of ore-producing mines in the Wood River country and on Smoky is very large, and when they are properly opened so that they can be worked to more advantage, Alturas will be a great lead and silver producing county. The success of mining in Alturas will not only add wealth to the Territory, but attract the attention of mining-men to other rich mineral districts and hasten their development.—*Idaho World.*

Right to the Use of Water.

The *Legal Adviser* gives its readers some information respecting water rights, which has been a source of great trouble and much litigation. It is a general principle, says the writer, that every owner of land upon a natural stream of water has a right to use the water for any reasonable purpose not inconsistent with a similar right in the owners of the land above, below, and opposite to him. He may take the water to supply his dwelling, to irrigate his land, or to quench the thirst of his cattle; to use it for manufacturing purposes, such as the supplying of steam boilers, or the running of water-wheels or other hydraulic works, so long as such use does not sensibly and injuriously affect its volume. But this is a mere privilege running with the land, not a property in the water itself.

Where the stream is small and does not supply water more than sufficient to answer the wants of the different proprietors living on the stream, none of the proprietors can use the water for either irrigation or manufacturing, but for domestic purposes and watering stock, one proprietor will be justified in consuming all the water.

Twenty years' use adverse to the right of another will give the person so using the stream the right to continue the use, regardless of the other's rights.

And as to the division of water, every one who owns land situated upon a stream has the following rights:

1. To the natural flow of the stream.
2. That it shall continue to run in its accustomed channels.
3. That it shall flow upon his land in its usual quantity, natural place and usual height.
4. That it shall flow off his land upon the land of his neighbor below, in accustomed place and at its usual level.

These rights he has as an incident to the property in his land, and he cannot be deprived of it by grant or description.

If any one shall make any change in the natural flow of a stream to the material injury or any interference shall prevent the stream-owner situated upon it, or by any form flowing as it was wont to flow, he is responsible for the damage he may occasion. These rights are subject to the privilege of each one to make a reasonable use of the water upon his own land while it is passing along the same. It matters not what the source of the water may be, whether it be back-water or the flowage of the same, or the water of another stream. Still, a division of a stream may be made by any one if it be returned to its natural channel before it leaves his premises.

THE GOLD AND SILVER MINES OF BOLIVAR.

In addition to being a rich agricultural and forest region, the department of Bolivar, United States of Colombia, is destined to become famous for its mines of gold and silver. A number of mines that were worked by the Spaniards, and of which all traces were lost, are being rediscovered in various parts of the department, notably in the district of Morales, near the town of Simiti, the extreme southern part of Bolivar. Many quartz mines are worked in this district, but in the most primitive style, the natives using huge wooden mortars and pestles. Some of the richest mines are located near the town of Simiti, in Morales, a place that has already 3000 inhabitants, and, in view of the recent discoveries, is rapidly increasing. The mines of Simiti were worked by the Spaniards as early as 1764, and, according to authentic history, yielded rich returns. Among the most notable of these mines is one called Bijao. It is situated only five miles from Simiti. This quartz mine is destined to again become famous, its present owners being an enterprising corporation, now engaged in making roads, building bridges and houses to facilitate the development of the property. Altogether, quite a number of mines have been located in this section, and a large amount of capital has been invested in their acquisition and operation. Simiti is about 300 miles distant from the ports of Carahagena or Barranquilla. A steamer can be taken from either of these ports to Bodega Central on the Magdalena river. From there a transfer is made to a smaller steamer, which takes about six hours between Bodega Central and Simiti.

As usual at this time of the year the weather prophets are abroad predicting the early advent of the rainy season; also, that it will be late, the signs favoring both conclusions, according as they are interpreted.

The Russell Process.

Its Practical Application and Economic Results.

(Continued from our last.)

I.—Total Mill Expenses of Various Mills While Using the Russell Process.

Table XXXVI gives the total mill expenses per ton of roasted ore in the Cusi mill for nine months, while using the old or ordinary leaching process, the Russell process, and both processes together (mixed months). The total expenses, including assaying, crushing, drying and stamping, roasting, leaching, roasting and refining of the sulphides, and production of bullion 980 fine, while using the Russell process, were \$12.08.

At Parral, also in Mexico, the total expenses for the treatment of tailings from ore which had originally been roasted, and leached by the ordinary process, were \$2.10 per ton for 40 tons per day. For roasted ore at the rate of 10 tons per day, the total expenses were \$9.15.

It should be observed that the expenses at Cusi much exceed, are indeed probably double, what they would be in a well-constructed mill in the United States.

In Table XXV the Cusi expenses are taken as a basis, from which are deduced the corresponding expenses for acid-roasted ores and raw ores in the United States.

The Cusi mill, however, was built so as to utilize, in part, old plant, and to work San Bartolo ore by the ordinary process. It was ill adapted, particularly in roasting and dust-saving facilities, for economical work on the hater San Antonio ore, by any process, and in its leaching department was unsuited to the Russell process. The \$12.08 on which the estimates are based is the average mill expense per ton while using the Russell process. In the second estimate of Table XXV, the reduction in cost, due to improvements in arrangement and construction, amounts to 30 per cent.

TABLE XXV.

COMPARISON OF TOTAL MILL EXPENSES PER TON OF ORE IN THE UNITED STATES AND MEXICO, BASED ON ACTUAL EXPENSES AT CUSI.

FIRST ESTIMATE.

Total mill expenses for Cusi ore and mill if the same ore and mill were in the U. S.

Actual total mill expenses of Cusi (see Table XXXVI).....	\$12.08
Deduct for difference in cost of salt and chemicals.....	\$2.54
Deduct for difference in expense due to shipping instead of refining prod.....	.03
Deduct for difference in cost of supplies, other than salt and chemicals.....	.60
Estimated expense per ton of ore.....	\$8.91

SECOND ESTIMATE.

Total mill expenses for Cusi ore in a well-constructed 75-ton roasting mill in the U. S.

Total mill expenses for Cusi ore and mill in the U. S. (see last estimate).....	\$9.01
Deduct for difference in cost of running 1 Stetefeldt as compared with 3 Howells.....	\$1.00
Deduct for difference in expense due to substitution of 6 50-ton for 22 9-ton leaching tanks.....	.65
Deduct for difference in expense due to increase of capacity from 55 tons to 75 tons.....	.80
Estimated expense per ton of ore.....	\$6.50

THIRD ESTIMATE.

Total mill expense for dry crushing, raw-leaching mill in the United States.

Total mill expense for Cusi ore in a well-constructed 75-ton mill in the U. S.	\$5.50
Deduct cost of chloridizing, salt and difference in amount of chemicals per ton.....	\$2.40
Estimated expense per ton of ore.....	\$3.10

In a well-constructed raw-leaching mill, the total mill expenses per ton for 75 tons per day should not exceed \$3 per ton, and under favorable circumstances would fall as low as \$2.50, particularly if the crushing were done by rolls instead of stamps.

At Silver Reef, Utah, the total mill expense, including also assaying and general expense, was \$1.65 per ton for raw tailings, at the rate of 40 tons per day, and \$3 to \$4 for raw ore, at the same rate per day. The corresponding expenses for 75 tons per day would be about \$1.25 for raw tailings, and about \$2.85 for raw ore.

For roasted ore, at Lake Valley, the total mill expenses for 60 tons per day were estimated by the general manager, Mr. Hadley, at \$4.65 per ton, including assaying, etc.

V.—Applicability of the Process.

A.—Values of the Materials Treated, in Gold, Silver and Lead.—Table VI gives the average values of all the tailings and raw and roasted ores on which the Russell process has been or is now in use. The values of the tailings, in silver, range from 8 to 12 ounces, of raw ore 14 to 15 ounces, and of roasted ore 12 to 88 ounces per ton. In gold, the value has been from 0 to \$5 and \$6 per ton. In lead, the range is from 0 to 23 per cent; ore containing the latter proportion having been treated at Cusi, and also at Somherete.

B.—Special Applicability to Ores Containing Lime, Antimony or Arsenic.

The superiority of alkaline-roasted, as compared with acid-roasted, ores in regard to amount of chemicals required per ton, has already been illustrated.

So far as extraction by hyposulphite solution is concerned, the most desirable elements

which can be present in material which is to be roasted, are antimony or arsenic, or both of them, in combination with the silver; since, in that case, both antimoniate and arsenate of silver are formed during the roasting, both of which are soluble in the leaching solutions. Of the two elements, arsenic is the most desirable, not only because arsenate of silver is about 3.57 times as soluble by a given weight of hyposulphite as antimoniate of silver, but also because the solubility of arsenate of silver is increased 2.4 times by the presence of caustic alkali, while that of antimoniate of silver is raised only one-sixth. The latter peculiarity causes the presence of arsenic, in combination with silver, to be particularly desirable in the treatment of alkaline-roasted ores.

On account of the solubility of antimoniate and arsenate of silver in the leaching solutions, some ores can be roasted entirely without salt, and still yield a high percentage by the Russell process (as at Yedras and Ontario).

The Solace ore in Idaho, from which nothing can be extracted in the raw state, yields 92 per cent after an instantaneous (or 5 seconds) roasting without salt in the muffle, on account of the presence of arsenic and antimony.

C.—Special Applicability, Either With or Without Concentration, to the Treatment of Raw Ores.

The advantages in favor of raw leaching as compared with leaching after roasting are as follows:

1st. The cost of plant for raw leaching is much less than that required for a treatment which includes roasting.

2d. Less power and less labor required in handling.

3d. No losses or discrepancies due to dust or volatilization in roasting.

4th. No salt.

5th. No acid, and less chemicals required for leaching.

6th. Less water, the amount per ton averaging only one-fourth to one fifth that required for roasted ores.

The practicability of raw treatment depends upon the value of the ore, supposing the percentage extraction to be the same for raw ore of different values. For instance, for a well-arranged mill, the losses occurring in the treatment of raw ore would probably be about 1 per cent, in addition to the loss in tailings, from the time the ore enters the mill up to and including the production of dried sulphides. In a roasting-leaching-mill the corresponding losses would be, probably, about 3 per cent.

In expenses, the advantages are in favor of raw leaching by about \$3 per ton. If the ore to be treated, therefore, has a value of 20 oz. per ton, 73 per cent extraction by raw leaching is equivalent to 90 per cent by roasting and leaching. But if the ore has a value of 50 oz., the extraction from the raw ore must be 82 per cent, to be equivalent to 90 per cent by roasting and leaching.

The great difference between the result by the ordinary and by the extra solution, on raw ore, is illustrated in the case of some ores lately experimented upon by Mr. F. M. Watson, superintendent of the Somherete mill. These results were as follows:

Name of mine.	Value in ounces.	Per cent extracted in assay office.	
		By ordinary.	By extra.
Buena Vista.....	60.0	25.0	70.0
San Geronimo.....	219.0	2.8	81.1
Penoles.....	38.0	8.0	86.0

If, however, the tailings from leaching, as is frequently the case, contain the precious metal also in such a combination as to admit of concentration, a combined leaching and concentration will frequently be more applicable than roasting and leaching, even though the leaching alone may not yield more than 30 or 40 per cent of the value of the ore. The additional cost of concentrating the tailings from the leaching will seldom be more than 50 to 70 cents per ton. When leaching and concentration are combined, if the concentration is by the wet method, it must follow the leaching; since, if it preceded, the result would be a separation of the slime and coarse ore, which would make the leaching practically impossible on account of the mechanical difficulty of introducing the leaching solutions into or of removing them from the ore.

D.—Applicability to Tailings from Amalgamation or from the Ordinary Leaching Process.

The Russell process extracts silver compounds which cannot be extracted by amalgamation. This is shown in the case of raw tailings at Silver City, New Mexico, which had already been treated twice by amalgamation, and once by concentration, and from which amalgamation, even in assay-office tests, would still extract only 22 per cent, while the extraction by the extra solution was 72 per cent.

Also at Silver Reef, Utah, the raw tailings, which had already been twice treated by amalgamation and from which practically nothing could be extracted by amalgamation, yield 40 to 80 per cent by treatment with the extra solution. This is in spite of the fact that the Silver Reef ores, from which these tailings were produced, are the only raw ores, so far met with, which yield a higher percentage by amalgamation on the first treatment than by the extra solution, although the expenses are less for the latter.

At the Minas Prietas, in Mexico, the extrac-

tion from the raw ore by amalgamation in a Bess mill, is 76 per cent of the gold, but only 9.2 per cent of the silver. The extraction from the tailings by the Russell process is 54.6 per cent of the gold and 30 per cent of the silver.

E.—Applicability of the Process to Dry or Remote Regions, or Where Salt is Expensive.

The amount of chloride of silver present in an ore is practically immaterial so far as the results of the extra solution are concerned. This was particularly noticeable at the Ontario, on roasted ore, the mill extraction by the extra solution, on ore with a very low chlorination, being 34 ounces per ton more than could be extracted by the ordinary solution, even in the assay office (the extraction by the latter representing approximately the amount of silver present as chloride). Also at Yedras, the extra solution in the mill extracted as high as 25 ounces per ton more than could be extracted by the ordinary solution even in the assay office; and the difference was much greater if mill results were compared. At the Ontario, the mill results by the extra solution, on ore roasted with no salt, were only 4 per cent less than by amalgamation on ore roasted with 18 per cent salt, and on ore roasted with 9 per cent salt were 3.5 per cent higher than by amalgamation on ore roasted with 16 per cent salt. Hence the Russell process can be used on ore with a very low chlorination, or on ore chloridized with less salt than would be necessary if the ordinary process or amalgamation were to be used. The applicability of the Russell process to remote regions is illustrated by the fact that over 90 per cent of the leaching plant, in bulk and weight, is of wood and can be constructed wherever wood can be obtained.

Its great applicability to dry regions, as compared with amalgamation, is shown by the fact that in the treatment of roasted ore leaching requires only one-sixteenth as much water as amalgamation, and in the treatment of raw ore only one-thirtieth as much as amalgamation.

VI. Comparative Applicability of Various Roasting Furnaces to the Preparation of the Ore for the Process.

A.—Effect of a Very Short Muffle-Roast, With Free Exposure to Air and Heat, on the Extraction and Loss of Silver by Volatilization. Table XXVI shows the effect on Yedras ore of a very short roasting in the muffle. In these experiments the ore crushed in the battery through a 26-mesh screen was sifted quickly, or spread in a thin layer on an earthenware dish and exposed in the muffle to a medium red heat. The table illustrates the fact that, as far as the extraction by the extra solution is

TABLE XXVI.

EXPERIMENTS ON VERY SHORT TIME OF ROASTING. RESULTS OF ASSAY-OFFICE LEACHING TESTS, YEDRAS ORE.

No. of charge.	Mesh of screen.	Per cent of salt.	Per cent extracted by ordinary assay office.	Per cent extracted by extra in assay office.	Difference per cent.

concerned, the operation of roasting requires not more than five seconds, if each particle of the ore is freely exposed to the heat and furnace gases at the same time, and that the loss in silver under such circumstances is practically nothing. On the other hand, deeper layers of ore roasted for half an hour to an hour showed a loss of 11 to 20 per cent, and in the case of concentrates as high as 40 per cent. In the experiments in Table XXVI, all the roasted ore was assayed, so that the determination of the percentage lost required no calculation. A still higher extraction in the same time was obtained on Solace ore, but no record of the loss of silver in these experiments was preserved. The above are the only two ores on which the quick roastings have so far been tried.

B.—Effect of Various Sizes of Crushing on the Furnace Results.

Table XXVII compares the Stetefeldt, Howell, reverberatory, and Bruckner furnaces as the results of using various sizes of screen.

The table shows that the Stetefeldt furnace gives about as good results with a 16 as with a 20-mesh screen, and the Howell with a 12 as with a 26-mesh, but the reverberatory gives a

little better results with an 8 than with a 16 or a 30 mesh, although the coarse part alone does not give as good results as the fine part alone. With the Bruckner, the change from a 26 to a 10-mesh produces very little difference in the results. The table also gives the percentage of salt used in each case. The Ontario ore is of higher grade than the others, and has therefore a little more salt.

C.—Differences in Extraction (Between Ore From Furnaces and Ore From the Cooling Floor or Vaults.

The cooling floor or vault samples are the only ones which can be taken as a standard of comparison for furnace-work. Evidently if the percentage of extraction decreases as soon as the ore leaves the furnace, a high extraction from samples taken in the furnace counts

Passing Events.

Latest news from the Yukon River region, Alaska, does not appear so encouraging as was hoped. The miners who have returned from there after prospecting the region conclude the difficulties are too great to allow mining to pay. A very short season, great distances to travel, uninhabited country and frozen ground, discouraged them from continuing work.

The mining community on this coast will be glad to know that the President has signed the Chinese bill, which prohibits all Chinese laborers from coming to the United States.

The finding of a good supply of natural gas in Marysville at a depth of 278 feet is a very important thing for that section of the State. No doubt other wells will be bored. In other parts of the State wells are being sunk in the hope of finding natural gas.

In the more mountainous and colder regions of this coast those miners who are "forehanded" are doing their assessment work for the year. This is much more sensible than leaving it until the last day of the year.

The President has signed the bill authorizing the appointment of a Government commission to examine into the debris question in this State, and we may now expect a thorough examination of the subject by impartial men.

California's Multiform and Vast Store of Mineral Products.

We have more than once, we have, in fact, very often, taken occasion to speak in these columns of the great abundance and diverse forms of California's mineral and metalliferous resources, and recur now to the subject for a special reason: Up till quite recently, with all this store of natural wealth, we have been able to turn very little of it to practical account, and that because we had for these commodities no available market. Being cheap and bulky, they would not bear long and costly transportation, and, with the limited population on this coast, only a few of them were here in much or any demand, none being in large requirement. And so, products that in other advanced countries would have led to the establishment of new industries and new sources of income, have here been neglected or been drawn upon only to the extent of supplying our narrow domestic wants, and not always even that far.

In so overlooking this class of our resources we have sometimes been charged with a lack of enterprise and thrift; and while the charge at first sight seems specious enough, it is without foundation in fact. Under the circumstances, our people have very often undertaken too much in this direction. Many of them in their premature efforts to utilize these mineral substances have been heavy losers, and that for the reason mentioned. Thousands and even millions of dollars have been lost in these industrial ventures. The pioneer endeavors to deal here with petroleum, graphite, manganese, antimony, sulphur, borax, asbestos, mica, marble, soda, chromium, and iron, not to mention other of these cheap commodities, which cost us dearly; the most of these efforts having in the first instance turned out pecuniary failures, nor have more than a few of them proved eminently successful. And this we say, not that these early trials are to be deprecated, nor yet that the outlook in this direction is now discouraging, but to show that our people have not been indifferent to their natural advantages, nor guilty of even a seeming lack of thrift.

But this is all of the past. In recurring to the subject in hand, it is our purpose to consider it with reference to the vastly changed conditions in store for us—conditions that await us on the threshold of the future. California has, within the past few years, received large accessions to her population. During the next few years these accessions will be swollen to much larger proportions—so large that she will, within the coming decade, be able to count her inhabitants by millions. When this shall happen we will reverse the rule that has elsewhere generally obtained, and instead of increasing our imports we will diminish them by making or producing more of the articles required for home consumption at home. As soon as the domestic call for an article becomes sufficient to warrant the erection of works to make it in a large way, such works will be erected, it being, of course, generally understood that anything to be made economically and efficiently must be made on a large scale. When this era, now so close at hand, shall have arrived in California, it will so expand this class of our industries as will cheapen while it perfects their products. Then all the commodities enumerated, and many more, will be turned out here in quantity ample for home needs, with much to be spared in the shape of exports to other countries. When the Bay of San Francisco shall be looped with cities and hamlets and villas, and the whole country shall be dotted with factories, farm-houses and homes, there will be need for much cement, plaster, lime, marble and freestone, with the precious onyx for interior ornamentation and decoration. When we shall have a hundred miles of streets to be paved and sidewalks to be curbed, where we have now scarcely one, then will the demand for granite, asphaltum, basalt and cobble be in proportion. As railroads and shipbuilding are extended, and the thousand other uses of iron are increased, there will arise a necessity for opening and working the deposits of that ore so abundant in this State. And so of our mineral paints, fire-clays, deposits of graphite, soda, and innumerable other products in this line.

Let us be accused of overestimating this class of our resources, it may be stated that of the 52 counties into which California is divided, not one is without mineral deposits of recog-

nized economic value. Even San Francisco, the smallest county in the State, can point to more than one product of this kind. In thirty of the above counties gold is being mined with success, and in ten both gold and silver. In two of these counties borax, in two salt, in three copper, in four quicksilver, and in a like number petroleum are all being produced on a large scale and with profit. Large beds of iron ore of a superior kind are found in five or six counties, and deposits of coal, a tolerably good fuel and suitable for making steam, in as many more, the most of these latter being now worked. Lead, chromium, antimony, graphite, gypsum, hydraulic cement, chalk, ochre, mica and asbestos all have a place among our useful metals and minerals, the most of them occurring in the greatest abundance. We have at least one valuable deposit of tin and may have more. The useful clays and building stones abound in all parts of California, many of these deposits being extensively worked.

The forthcoming report of the State Mineralogist will be to most people a revelation in this respect. It will appear from that document that many counties in this State heretofore classed as purely agricultural, being called in derision "cow counties," have the mineral kingdom largely represented within their borders. Closer inquiry than had before been made, or was indeed practicable, brings to light much that is new as well as highly useful in this connection.

In so far as supplying her rational, or even possible, wants, California is an empire in herself, and when her system of future industries comes to be established, she will show herself more nearly self-supporting than any other country in the world. As she is now sending her agricultural staples to so many other peoples, so will she buy-and-by her sending them her mineral products as well. We cannot now measure or even guess what may be their kind or extent. But as we have so often been surprised in these particulars, so may it be expected that there are other surprises in store for us, though whence they will come, or what shape they will take, none can divine.

Prospecting in Alaska.

The miners who went up the Yukon river, Alaska, this season, to make their fortunes in the placer mines, appear to have had a hard time of it without getting much gold. Eighteen of them arrived at this port on the U. S. steamer Rush, this week. The U. S. steamer Thetis found a party of 72 miners at the mouth of the Yukon, who had drifted down the river, and had no other means of transportation from that place. The vessel brought them to Ounalaska, and the Rush brought 18 from there. The others will come down on the Thetis.

According to the story of the returned miners, which we publish in our "mining summary," on another page, the deep frozen ground prevented prospecting or mining. Each man, however, got \$26 for six days' prospecting, so there must have been considerable gold there when that much was obtained under the difficulties mentioned. The men met other miners, who had traveled in other parts of the country, but who were discouraged by the prospects.

As we have mentioned in previous numbers of the PRESS, Alaska is no place for poor men to go to. The country is sparsely inhabited; there are few towns; no roads. The season is short, and provisions are very high. Transportation is nearly all done by canoes, heavy timber and swamps obstructing the way on the land. The men who have first returned are all disappointed, and tell stories of hard-up and high prices which will deter others from going next season.

CAPITAL has been secured in New York to complete the ditches, etc., for the Osceola Gravel M. Co., Osceola, Nev. The money is to develop the property in good shape, bring in water, etc. The water supply has heretofore been too scant for successful operations.

MACHINERY for a 20-stamp mill is being packed in on mules to Humboldt canyon, Placer county. The mine for which it is intended belongs to Jas. G. Fair and Mr. Davis.

THE ORE from the Brunswick mine, Nevada county, has not yielded up to expectations, and the mine has been attached.

Publicity of Mining Facts.

The early days of mining on this coast were characterized by speculation and stock gambling rather than by legitimate mining. One of the greatest aids to stock gambling was power to suppress any facts concerning the property. The public were only allowed to know so much of the business of the company and of the state of affairs in the mine and reduction works as suited the purpose of the controlling manipulators. Quite naturally employees became secretive, for the price of their positions was silence—in fact no one outside of the chosen few knew anything whatever of the actual state of affairs. From custom it has become habit, and the annual reports made by the directors of mining companies to the stockholders are little more than an account current. Such a statement may be amply sufficient so far as an understanding of the financial state of affairs is concerned. If it were the custom of directors to give to the stockholders an annual report of the work of the year embodying the results of any trials of mechanisms or processes, whether they were successful or not, together with such information concerning the cost of production as is ordinarily required by manufacturers, and an outline of the regime to be pursued for the coming year—of course the directors would be expected to withhold any information the publicity of which would impair the company's profit—if, as we say, such were the custom, directors would not only be doing their duty by the stockholders, but in the case of many companies they would positively do the company a benefit. Giving publicity to experiments with mechanisms or processes brings them before engineers generally.

An engineer might have charge of a copper property, but, while reading of the failure of some silver-mining company to make some particular piece of mechanism or metallurgical operation work successfully, he might be able to see their difficulty and solve their problem. Again, giving publicity to failures—and we particularly say failures, for it is the making successes of failures where the gain is to come—brings the difficult problems to the notice of professional men connected with public institutions. These men have, generally, more time and facilities at their command for minute investigation, hence they could very often solve problems that would otherwise, for a time at least, remain unsolved. Engineers and the mining profession generally are, as a rule, liberal in giving publicity to valuable discoveries and free in criticism; give them problems to work out; do not suppress your failures.

THE ACADEMY OF SCIENCES.—A meeting of the Academy of Sciences was held on Monday evening, Dr. Harkness, president, in the chair. The Librarian reported an addition of 75 books to the library and a donation of a number of mammals was received by the cabinet. Dr. Eccles of the Torrey Botanical Club addressed the scientists present on "The Importance of Botany and Its Advantage to the Community," after which Mrs. Mary K. Curran, curator of botany of the Academy, read by proxy a paper on the trees and shrubs of the Sierra Nevada. The paper was compiled from the observations of a recent trip made by the writer to the region described. The Board of Trustees had a meeting on Monday afternoon to hear the report of the special committee who have the proposed new building in charge. Architects were chosen and plans discussed.

OUR MINERAL PRODUCTS.—Dr. David T. Day of the Division of Mining Statistics of the United States Geological Survey estimates the value of all the mineral productions of the country for the past year, including petroleum, natural gas and other inorganic substances, at \$538,056,345. Of this, pig iron amounted to \$121,925,800; silver to \$53,441,300; gold to \$33,100,000; copper to \$21,052,440; bituminous coal to \$98,004,654; anthracite coal to \$84,552,181; and building stone to \$25,000,000. The mineral product for the year is the largest in the history of the United States, and the largest mineral production ever reached by any country.

THERE are over 1,000,000 pounds of coke stored on the platform of the Old Dominion Copper Co., says the *Wilcox Stockman*, thus insuring work for freighters for several months to come.

Sinking Natural-Gas Wells.

Various theories have been advanced to the origin of natural gas. There has been knowledge of its existence for ages, but it has only been brought into use in the past 20 years or so to any great extent. It is now used in many places like ordinary coal, but it is much better fuel for iron, steel and glass manufacture. One of the great difficulties in obtaining gas from alluvial deposits, such as clay or sand, is that it is very hard to keep back the water. In the central part of Illinois the farmers have used gas for many years in their houses, the gas being found at about 130 feet deep. This gas vein lies in a bed of gravel, having a covering of hardpan and blue clay, and below it the same substance. This hardpan consists of gravel cemented together by the organic substance in the water, and it is harder to drill than ordinary stone. By repeated heavy blows this crust is broken. Immediately underneath it lies a heavy bed of water, and great skill has to be exercised not to cut through it when sinking for gas.

The gas-driller, as a rule, is not a driller for water. His knowledge is a great deal different; he drills for gas; shuts off the water that he comes in contact with. If he does not, and the hole is full of water while drilling, the weight of the water is so great as to shut off the gas and prevent its coming up the top. It is, therefore, absolutely necessary that good tight casing should be used in shutting off the water as each water stratum is reached. The well may be sunk by the hydraulic process, as it washes the veins cleaner than by the dropping process, and whenever gas is struck it will bubble up in the water and show itself. You cannot smell it. It is agreed by all geologists and gas engineers that gas exists in any formation of rocks where there are seams or cavities and the rock is porous and not full of water. It has been clearly demonstrated that gas is found in the following formations of rock, and there is no doubt but that it exists in all organic substances of the earth when there is a reservoir to retain it, and the conditions are favorable for holding it. It has been found in the sandstone formation, in limestone, soapstone, blue, red and yellow clay, conglomerate-rock, hardpan, and in the alluvial deposits in coal strata.

At Galveston, gas bubbles out from a sand-bed 800 feet deep, and as the water is discharged on top of the ground it rises out of the water and burns like alcohol, with a blue flame. There are many regions where gas exists, but on account of the water stratum which lies above the gas-bearing strata, and the means that has been used in drilling, water has been allowed to run down into the gas and shut it off.

For example, if a stratum of gas was reached at 1000 feet, and the drill-hole was full of water, it would require a pressure of over 500 pounds to force the water out of the hole. Gas having apparently no weight in the air, its pressure would be the same on the surface as it would be in the bottom of the hole, but the weight of the water would be in proportion to the depth of the well. Approximately two feet of water would equal a pressure per square inch of one pound. That is near enough to convey the idea to the practical well-sinker.

Those who have had experience advise those who contract to sink wells for gas under no circumstances to get the work done by the foot, or so much money for the job, whether gas is found or not, as the driller has but one object in view, and that is, to make the hole to the desired depth and draw the money for it. To sink a well properly requires great care, and sometimes the work is very discouraging on account of mishaps and the shutting off of water veins, as often a very few feet of drilling, after water is reached, gas may also be reached and lost by bad management on the part of the driller.

The best illustrations of perfect and imperfect work are the wells drilled in the oil and gas regions, where wells are sunk within 100 feet of each other where on an average one-half are failures. It seems as if wells sunk and drilled properly should yield correspondingly. There is another difficulty in drilling wells, and that is, in keeping them properly cleaned. If sunk with a dull drill, and the detritus is allowed to accumulate in the well, it will form a substance almost like plaster, and cement up the crevices in the rock or slate, as it is being penetrated, thoroughly stopping them up.

These facts we gain in reading a little illus-

trated pamphlet on "Natural Gas and Oil," published by the American Well Works of Annona, Ill. The treatise contains illustrations and descriptions of the tools and appliances used in this kind of work. The subject is one of great interest in California just now, where so much prospecting for oil and gas is going on. The company has published several other treatises, none costing over 25 cents. They are all on kindred subjects, such as diamond boring, prospecting apparatus, well-sinking appliances, earth-boring machines, well sinking, wind engines, etc.

LEACHING PLANT.—On this page are given cuts showing some of the details of plant for the Russell leaching process. Fig. 7 is the precipitating-tank; Figs. 8, 9, 10 and 11, gate for dis-

DETAILS OF LEACHING PLANT FOR THE RUSSELL PROCESS.

charging sulphides; Figs. 14 and 15, detail of filter; Figs. 16, 17, 18 and 19, discharge pipes for the various tanks. These are described fully in the article now being continued in the PRESS. In our number of Sept. 22d, pages 190-191, will be found a portion of the description.

STEEL CARS.—The telegraph of Tuesday reports that a company has been organized to manufacture railway cars constructed entirely of sheet steel, under the patents of C. W. M. Smith of this city. The company, it is also reported, is negotiating for a large tract of land near Chicago on which to erect a factory. It is claimed the new vehicles can be built as cheaply as wooden coaches.

The Carlisle Company, N. M., for the last seven months, crushed 26,700 tons of ore, yielding in gold bullion \$195,000, and 2270 tons of base concentrates. The smelter is in continual operation. The company's payroll is \$16,000 per month.

WM. CHURCH, for many years resident manager of the Detroit Copper Co. of Morenci, Arizona, has resigned and gone to Denver.

Bridging the Willamette at Portland.

Our Portland (Oregon) correspondent writes that the Morrison-street bridge across the Willamette river, connecting Portland and East Portland, is proving a tolerably remunerative enterprise. Its construction was strongly opposed by ship and steamboat owners, who claimed that it would be an obstruction to commerce. The work was enjoined, and after \$35,000 was expended the enterprise lay dormant for some time. At last the injunction was raised. The bridge was built at a cost of \$200,000. It is high enough above the water to admit of the passage beneath of many of the smaller steamers and tugs, but has a long draw with nearly 50 feet clear space each side of the abutment, to allow the passage of high-

masted vessels. There is a street railway across the bridge, and it is a means of communication which is being more and more used between the two Portlands. It paved the way for the iron railway bridge built a short distance below, and this will undoubtedly be followed by other bridges in the near future. The present bridge has been open to travel since April 12, 1887. It has a system of tolls too complicated to mention in this item. We apprehend that some day the two city corporations will see to it that this, and other bridges yet to be, shall be made absolutely free to the public.

THE MINING DEBRIS PROBLEM.—Among the various bills approved by the President on Tuesday last was one for the investigation of the mining debris question in California.

A PLANT of Bellows' electric process for rendering refractory ores "free milling" is to be set up at Silver City, New Mexico, by Colonel John M. Wright.

SEVERAL of the mining companies of Honduras are yielding good monthly returns of auriferous silver bullion.

Agricultural Title to Mining Lands.

NUMBER II.

In the PRESS of last week the method adopted of obtaining agricultural title to mineral lands was described, and it was stated that we should follow up the subject and give the miner's position on that part of the question relating to prosecution where claimants had made false statements concerning the nature of the land. The reasons why the miner does not prosecute for perjury are:

1. The expense of such a suit would be even greater than those involved in opposing the homestead claimant's "final proof."

2. Conviction would be impossible except in very flagrant cases, because the claimant and witnesses are only required to swear to the best of their knowledge that no valuable mineral deposits are existing on the premises, and that in their opinion the land is more valuable for agricultural than for mineral purposes; and a man can hardly be convicted of perjury for expressing a mere belief or opinion.

3. The miner has to prove beyond doubt that his claim is really valuable, which means, or is construed to mean, a *dividend-paying* claim. Such, at least, has been the ruling at Sacramento, we understand, in contested cases of this kind. By this ruling the miner's right of possession, granted to him by the law of Congress, allowing him the fractional part of the year in which his location was made, and the whole of the next following year, and requiring only a yearly expenditure of \$100 a year thereafter to develop and prove the value of his claim, is wholly set aside. It is well known that mining claims, and particularly quartz lodes, often require an expenditure of large sums of money, as well as years of time, to develop and establish them on a paying basis, and that even the best and most valuable mines at times will not pay the actual expenses of working them.

4. There is no difficulty in the agricultural claimant obtaining from men of his own class all the affidavits he requires to the effect that the land is more valuable for agricultural than mining purposes, while the miner, even if he endeavors to show to the contrary by producing the certified copy of location of a bona fide mining claim upon the premises, is required to prove as above that the location is valuable.

Now it frequently happens that no sooner has the homestead claimant's final proof been accepted; when he has paid for the land and received his duplicate, and when the land is closed and lost to the prospector, that he, the claimant, suddenly becomes aware of the mineral value of his land, and is ready and willing for a consideration—generally one-third of the find—to allow the miner to prospect ledges or old mines, which were known to exist on the land, but from some cause or other were not actually worked at the time final proof was offered. In other instances the agriculturalist busies himself in holding and selling as valuable mineral property the land he has but lately acquired under agricultural title.

It will readily be seen how glaringly unjust is the present condition toward the man who is honestly endeavoring to comply with the law and who is averse to acquiring a title to his mining ground by perjury. At most he can obtain by mineral patent only 20.65 acres, and hence making his application he must show an actual outlay in development of not less than \$500. Add to this the cost of survey, attorney's fees, etc., which seldom amount to less than \$400, and in contested cases very much more; also \$100 to the Government for the land. Besides this there is generally a vast amount of annoyance and loss of time from the precautions exercised by the local land offices and afterward at Washington, so that it is extremely difficult for a poor man to acquire a patent title to his mine. But land of exactly the same character and nearly eight times as large is acquired through fraudulent homestead and preemption movements up at but a small part of the cost of a single quartz patent, and with the slightest possible trouble and complication. This is being generally seen in California, and is producing on the one hand much dissatisfaction among honest men in the mining communities, and on the other hand greatly adding to the number of the unscrupulous by offering so easy a method to acquire the absolute title to large bodies of mineral lands. It is our purpose to still further refer to this subject on another occasion.

MECHANICAL PROGRESS.

Recording Rail Vibrations.

M. Conard, one of the leading engineers of the Lyons railway, in France, has been conducting, for the past five years, very extensive experiments for the purpose of ascertaining the state of a railroad track during the passage of trains. With the apparatus designed by him for the purpose he has succeeded in obtaining graphic charts of the flexion and lateral thrust of the rails, and the inclination of the ties under the varying strains of passing loads of different magnitude. The apparatus used by M. Conard was quite similar to that used in physiological researches for the determination and registration of animal vibrations of various kinds. An explorer of small size was placed upon the rail to be studied, and all the motions received were transmitted to a transcribing device, placed at a sufficient distance from the track to be beyond the influence of its vibrations. The transmitting part of the apparatus is a simple rubber tube inclosing compressed air, and it is the variations in pressure caused by the displacements of the explorer that act upon the transcribing apparatus.

The explorer is a sort of bellows, consisting of a small round metallic box, closed by a sheet of rubber, to the center of which is fixed a rod whose rounded head bears against the rail. A spiral spring fixed to the bottom of the box repels the rubber and prevents the box from flattening without external stress. In the bottom there is a small tubulure, to which is fixed a rubber tube connecting with the transcribing apparatus. The receiving and transcribing apparatus embraces a bellows quite similar to that of the explorer, but the rubber diaphragm carries a very light goose-quill style that inscribes the displacements upon a cylinder covered with lampblack. The blackened cylinder that constitutes the registering apparatus is driven by a clockwork movement, the uniformity of whose movement is regulated by a Foucault pendulum. It may be given three different velocities through appropriate gearings, or be stopped instantaneously. The inscriptions are taken upon the blackened paper that covers the metallic cylinder and are afterward fixed by immersion in photographic varnish. Regularity of motion being highly essential for the exact determination of the speed of trains, this is accomplished by means of a tuning fork whose motions are kept up by an electric current.

With this apparatus M. Conard had noted interruptions amounting to 100 per second, but the apparatus is so sensitive that it is said to be capable of inscribing 1000 or even 1200 vibrations per second. The graphically recorded data secured by M. Conard permits of a very thorough analysis of the complex motions and strains of rails.

A GREATER THAN KEELY.—Another revolution in motive-power promised. The *Scientific American* of a late date says: Several newspapers have referred to a new invention by one William Timmins, which, if successful, will revolutionize motive-power. The inventor is an unpretentious English mechanic residing in Pittsburgh, Penn., who claims to have invented a machine by which united motive-power can be stored or used without the expenditure of fuel. The story goes that he has been engaged for years in perfecting the invention, and is now negotiating with the Governments of England, Russia and the United States for the sale of the right to use his discovery, which, if after examination it proves to be what it claims, will revolutionize the motive-power of the world. He claims to be able to create a pressure of 20,000 pounds per square inch—more than sufficient to propel the largest ocean steamer afloat, or to move 80 laden freight cars in one train. The machine seems to be simply an air compressor of the simplest sort. It consists of one small cylinder (six-horse power), with a balance weight of 75 pounds, which runs the entire apparatus; another small cylinder, five inches in diameter, with seven inches' stroke, compresses the air into a tank from which the power is utilized. Under the piston-plate the inventor has placed two layers of bars containing 11 different minerals, the magnetic influence of which is the secret of the invention. The advantages he claims are durability, economy and simplicity. Experts have examined the machine and pronounce it a success. In submitting his design to the Governments named, Mr. Timmins claims that the pneumatic generator can not only be applied to war vessels as a motor, but can be used as a defense against hostile attacks by means of air chambers placed behind the armor plating.

NINETY-FIVE MILES AN HOUR.—It is said by the *Philadelphia Ledger* that an application has been filed by a New York civil engineer for a patent for a locomotive and tender designed for making faster time than has ever been made in this or any country. The boiler is rectangular in shape, having a large and permanent area of evaporating surface, supported by a great extent of heating surface, the pressure at its weakest points. The cylinders are in the rear of instead of between the truck wheels, and the fire-box is supported between the center of gravity of driving-wheels. All the combinations of parts are in exact harmony, and it is intended to easily make the time of 60 miles an hour with 10 coaches, and can, without violent

strain, be brought to 95 miles an hour with the same load. This gain in performance over the present machine is obtained by a mechanical construction with reference to the distance between the rail centers upon which it is supported, and is the first application made which has embraced and specified every portion of a locomotive and tender constructed mathematically with reference to the limits within which they must be confined and supported. As a result of exact proportion with reference to such base, the cost of maintenance will be greatly below the general average of present constructions.

SLIPPING OF BELTS.—A writer on slipping of belts says that though a radical remedy consists in keeping the belt pliable, so as to hug the faces of the pulley, this is not always feasible; the belt may be softened by neatfoot oil or by castor oil. Siccative oil, like linseed, is unfit for a leather belt, as it has an affinity for the oxygen of the atmosphere and reverts to its acid base, which is injurious to the leather. According to this writer, a ready remedy for a slipping belt consists in the powder known as whiting, sprinkled sparingly on the inside of the belt, this being the least harmful of any similar application. Powdered resin is bad, as it soon dries the leather and cracks the belt, while it is difficult to get it out of the leather, whereas whiting may be wiped off or washed out with water. Again, the use of water on belts, preliminary to oiling, is good—the belt to be washed on shutting down at night, or, what is better, after the close of work on Saturday, and the oil then applied when the belt is partially dry, but in no case should a belt be washed or oiled while stretched on the pulleys. It is asserted that if iron-faced pulleys were always lagged with leather there would be but little slipping of belts, but in many cases the slipping is due to too much strain on the belt. There is also economy in running wide belts; that is, wider than is the usual practice.

ABANDONING NATURAL GAS.—One by one the manufacturers in the Ohio valley are abandoning the use of natural gas and returning to coal, because of its irregular supply and the extortionate price demanded. The gas companies may find before long that it takes two parties to make a bargain. While the people have been to a great expense putting gas in their factories and dwellings, and would regret to forego the use of gas, they will not stand imposition or extortion. They were assured that gas would be furnished at or below the cost of coal, but the prices charged last year were fully 20 per cent in advance of coal, and now it is proposed to advance the rate to private consumers 33 per cent. We mistake the temper of our people if they stand it.—*Ohio Valley News.*

THE LARGEST CASTINGS.—The Pittsburgh Steel Casting Co. has signed a contract to furnish among other castings a stern post which will weigh 17 tons. This, it is claimed, will be the largest steel casting ever made. Iron castings, however, have been made, so it is said, as high as 160 tons. At least it was stated five or six years ago that Park Bros. & Co. of Pittsburgh cast, in one piece, an anvil weighing 160 tons. The steam hammer for which it was made had a falling weight, exclusive of steam pressure, of 17 tons, with a clear stroke of nine feet. It is quite possible that the above remain, respectively, the "largest ever made in this country."

BURNISHING STEEL BY ELECTRICITY.—The following method of burnishing iron and steel by means of the electric current was recently communicated to the International Electric Society of Paris by M. A. de Meritens. The metal to be covered is placed in a bath of water at about 170° Fahr., and is connected to a source of electricity just strong enough to decompose the water. Under these conditions the plate becomes coated with a layer of magnetic oxide, which is firmly adherent and which will take a high polish. If too strong a current is employed the layer of oxide will not adhere to the metal.

A NEW WOODEN PULLEY has been devised on an entirely new principle. The center is of cast iron, and the rim is of wood, and it is made in two parts. It is claimed that by its use, better belt friction is obtained, and a saving in power is realized, as the spokes are so formed as to offer little resistance to the motion. By a novel and effective paper bushing, keys and set screws are entirely done away with, and the grip upon the shafting is perfect.

WIRE SHOE SOLES.—It is stated that in the various military districts of North and South Germany, as well as in Holland, trials have been made of wire soles covered with a substance resembling india rubber. These soles are said to be more durable than those made of leather, and to cost only about half the price of leather.

LOCOMOTIVE SHOPS.—There are 15 private locomotive-building establishments in the United States, which built 1912 engines last year, while the railroad-shops turned out 318. It was the largest production on record, the cost of the locomotives being near \$20,000 each.

A NOVEL FLAT-IRON.—It is said that a genius has invented a flat-iron and so utilized the principle of expansion of metals by heat that a little bell rings when the iron is hot enough to iron clothes with.

SCIENTIFIC PROGRESS.

Underground Waters.

Professor Daubree shows, in an interesting paper on the above subject in the *Popular Science Monthly*, that underground waters are potent agents in the formation of minerals. The following extract will be found instructive:

The mode of formation, or, as Buffon said, the genesis of minerals, is one of the interesting questions of their history. But the problem could not be approached until geologists had furnished precise data on the conditions of their bearing. Satisfactory solutions have recently been obtained in the case of a certain number of mineral species. Synthetic experiment, placing itself in the circumstances that seem to have presided at their formation, has succeeded in reproducing them, with their crystalline forms and all their essential characteristics, and has thus completed the demonstration of their origin. By means of this method of demonstration we have been able to ascertain that many minerals are due to the action of subterranean waters. From the most ancient epochs these waters have circulated through the crust of the earth, where they have left, at a multitude of points, signs revealing the part they have played and the course they have taken even more clearly than contemporary phenomena have done.

The sedimentary beds, formed like the deposits which the sea spreads every day in the bottom of its basin, are often distinguishable from one another, even at first sight, by certain exterior characters. The differences are, for the most part, produced by the action of subterranean waters, as is demonstrated by the animal and vegetable fossils, which were for a long time designated as petrifications, or, rather, by the chemical changes which these fossilized bodies have evidently undergone.

Here shells and corals, showing forms perfectly preserved down to their slightest details, are no longer composed of carbonate of lime, as they certainly were during the life of the animal to which they belonged, but are essentially different substances, quartz having entirely taken the place of the calcium carbonate. There are also other minerals, such as pyrites and sulphate of baryta, which have penetrated and crystallized within the cavities which the bodies of these invertebrates occupied.

AN IMMENSE METEORITE.—We learn from *Science* that the famous Bahia or South American meteorite, described by Morney and Wollaston in the *Philosophical Transactions* for 1816, and by Spix and Mertius in their "Travels in Brazil," was landed in Rio de Janeiro on June 15th, and is now in the collection of the Brazilian National Museum. The transportation of this great mass of iron, whose weight was variously estimated from six to nine tons, and which has been found to weigh 5361 kilograms, was rendered possible by the recent completion of a line of railroad passing within 115 kilometres of the Bendego creek, where it has lain since the unsuccessful attempt to remove it to Bahia in 1785. Credit for the removal of the meteorite is due chiefly to Chevalier Jose Carlos de Carvalho, who gratuitously took charge of the technical part of the operation, and to Baron Guahy, who paid all the expenses. The Brazilian Government also cordially associated itself with the undertaking. After about three months spent in preparing material and in studying the route to be traversed, the march began on November 25, 1887, and the meteorite was placed on the railroad on May 14th of the present year. A road had to be opened for this special purpose, as those existing in the region are only mule paths; and over 100 streams, one with a width of 80 metres, had to be crossed by temporary bridges. The route lay over several chains of hills and one mountain range, in which an ascent of 265 metres had to be overcome with a grade of 32 per cent.

ELECTROLYTIC PRODUCTION OF MAGNESIUM.—M. de Mongelas has lately devised a process for obtaining magnesium by electrolysis. An alloy of magnesium is first obtained in the form of an electrolytic deposit. The bath consists of a concentrated solution of chloride of magnesium, combined with an equally concentrated solution of the chloride of any other metal except aluminum. The solution preferred is one part of chloride of zinc and two parts of chloride of magnesium. The two solutions mark 18 degrees on the Beaume scale. Good results are obtained by using the electrolytic bath as the battery. The external jar contains the double chloride solution and the copper cathode; the amalgamated zinc anode is placed in dilute sulphuric acid. The zinc is deposited in a "spicular" or "arborescent" form, and the magnesium in granular crystals. This alloy is then washed, dried and crushed and finally melted in a crucible containing chloride of sodium. The zinc volatilizes, and leaves pure magnesium.

THE SEA BOTTOM BETWEEN SAN DIEGO AND HONOLULU.—Soundings made between San Diego, Cal., and Honolulu, S. I., show this part of the Pacific to be a basin with precipitous sides and a comparatively level bottom. In the first 100 miles west from San Diego there appear to be two valleys and two peaks. The first valley is from 622 to 784 fathoms deep, the first peak 445 fathoms, the second valley 955

fathoms, and the second peak 566 fathoms. Thence a precipitous fall takes place, giving in latitude 31 degrees 43 minutes north, longitude 119 degrees 28 minutes west (Greenwich), 115 miles from San Diego, a depth of 1915 fathoms. After that there is a gentle slope, with comparatively unimportant interruptions, at the rate of three feet to the mile, to the point of greatest depth, 3054 fathoms, at a distance of 400 miles east of Honolulu. The sharpest elevation is a rise about midway between the United States and the Sandwich islands, in latitude 26 degrees 30 minutes north, longitude 127 degrees 37 minutes west, the highest portion of which is 2159 fathoms below the surface. The valley to the west of this elevation is 2650 fathoms. The fall of the side of the basin east of Honolulu is even more remarkable than the descent off the American coast. Fifty miles from Honolulu soundings gave 498 fathoms; 40 miles farther east, in latitude 21 degrees 43 seconds north, longitude 156 degrees 21 seconds west, the depth was 3023 fathoms. Between the last-mentioned point and that of greatest depth a hill rises, on whose summit there are only 2488 fathoms of water.

SNOW FROM A CLEAR SKY.—On January 3d snow fell in Christiania from a perfectly clear sky. After a strong southerly wind, with cloudy weather in the morning, the weather cleared, but at about noon it again thickened, and snow and sleet fell. In the afternoon the sky again became clear, and continued thus, with a storm blowing from the west. Just before eight P. M., however, thick clouds again gathered, the full moon became obscured, and snow began to fall heavily. A quarter of an hour later the wind swept the clouds away, and the sky became completely clear, with the exception of a few clouds in the east. The stars shone brightly, and the full moon illuminated the landscape; still snow continued to fall thickly for some ten minutes. That the snow could not have originated with the clouds in the east is proved by the circumstance that the wind was westerly. A well-known meteorologist ascribes the phenomenon to the presence, at a certain elevation in the atmosphere, of a very cold layer of air, in which the ascending comparatively warmer air becomes condensed; the moisture being thrown out in the form of snow, but not in sufficient quantities to obscure the blue sky, the stars, and the moon. The great chilling of the layer of air referred to may have been caused by the coldness of the heavy snow-clouds which a few minutes previously filled the atmosphere.

HYDROGEN GAS.—A new source of hydrogen gas for experimental purposes has been pointed out. It consists of powdered slacked lime and iron filings. When these two substances are intimately mixed and heated to redness in a proper chamber, a very considerable amount of hydrogen is evolved. The only precaution necessary is, to use a vessel so shaped that the water of condensation will not fall or flow back upon the material. For experimental purposes a strong, soft glass tube, with a bulb blown at one end, answers very well. The open end must be directed downward in such a manner that the condensation water will be carried off, as noted above. From 20 grammes of an equal mixture of lime and iron filings, Stolba obtained, in the course of 20 or 30 minutes, 1230 cubic centimeters of hydrogen.

WALKING VS. ARM EXERCISE.—Walking on an even surface, says Walter B. Platt, M. D., in *Popular Science Monthly*, the only variety of physical exercise which most business and professional men get in town, is well known to be a poor substitute for arm exertion. The reason is partially plain, since walking is almost automatic and involuntary. The walking mechanism is set in motion as we would turn an hour-glass, and requires little attention, much less volition and separate discharges of force from the brain surface with each muscular contraction, as is the case with the great majority of arm movements. The arm-user is a higher animal than the leg-user. A man's lower limbs merely carry his higher centers to his food or work. The latter must be executed with his arms and hands.

BUMPING DURING DISTILLATION.—It is said by A. Reissmann that all bumping of liquids undergoing distillation is effectually prevented by placing in them one or more platinum spirals closely wound around several pieces of pumice-stone. The platinum should be heavy enough to sink the pumice. This is unquestionably true; but it is nothing new. One of the first "wrinkles" the tyro in the laboratory picks up is the knowledge that the introduction of a few angular fragments of stone placed in a boiling liquid will prevent bumping during ebullition, a fact which he at once proceeds to utilize when he improvises a water bath from a beaker glass and in other ways.

ESSENCE OF BIRCH.—French chemists now obtain from the essence of birch bark, by rectification, an essential oil which possesses among other properties that of being fatal to insect life, and an electrically insulating tarry substance; and these two products are so treated and combined with other substances as to produce an anti-oxidizing compound and an insulating material capable of the same applications as ebonite.

USEFUL INFORMATION.

AN EGG SHELL.—The shell of all eggs is studded with small orifices, which are the means of absorption and exhalation by which the little animal in the egg respire. On this knowledge are grounded all the methods of preserving this egg by closing the pores. These pores are more or less visible, according to the species of egg. They are very apparent in the egg of the ostrich, and scarcely visible to the eye in other species, but their functions are no less active. Many eggs are laid naked, dry and smooth; others are impregnated with a greasy, glutinous substance. The latter are chiefly those of sea-birds, or those which live in moist localities. This glutinous coating is doubtless intended to preserve the egg from the water, or to maintain the degrees of heat necessary to preserve life. Sometimes there are soft eggs laid entirely without shells, or without the albuminous inner membrane. This occurs chiefly in hens that are too fat, or have been overstimulated, or have not been able to obtain calcareous substances with their food. Egg shell is much used in medical preparations. When calcined at a low red heat it affords a very pure form of carbonate of lime.

THE MUSIC OF THE ANCIENTS.—The Egyptian flute was only a cow's horn with three or four holes in it, and their harp or lyre had only three strings; the Grecian lyre had only seven strings, and was very small, being held in one hand; the Jewish trumpets that made the walls of Jericho fall down were only rams' horns; their flute was the same as the Egyptian; they had no other instrumental music but by percussion, of which the greatest boast made was the psaltery, a small triangular harp or lyre with wire strings, and struck with an iron needle or stick; their satchet was something like a bagpipe; the timbrel was a tambourine, and the dulcimer was a horizontal harp, with wire strings, and struck with a stick like the psaltery. They had no written music; had scarcely a vowel in their language; and yet, according to Josephus, had 200,000 musicians playing at the dedication of the temple of Solomon. Mozart would have died in such a concert in the greatest agony.

TO RAISE OPIUM.—The San Bernardino *Index* says that a Chinaman named Ah Gee, who, except during the ten years that he has lived in this State, has spent most of his time in the poppy districts of China, is endeavoring to procure a farm upon which to raise poppies. He says that nowhere—not even in China—are there to be found such adaptations for the culture of the poppy as in San Bernardino county. He explains the manner of its culture as follows: The seed is sown in beds and the young plants are transplanted into rows. The plant grows to be large enough to produce some gum the second year, but is at its best when from three to ten years old. Two Chinamen will take care of ten acres if they understand the business. The seed is sold by all the Chinese stores in San Francisco and costs about \$1 per acre.

UTILIZING THE WASTE OF SAWMILLS FOR PAPER PULP.—It is found practicable at last to make the waste of pine sawmills available for paper pulp. In reducing the wood to pulp, hisulphate of lime has been used, this powerful chemical acting on the fiber only when heated; heretofore only lead-lined boilers would resist its action; these, however, being costly and hard to keep in repair. More recently there has been discovered in Germany a kind of brick lining for boilers, which serves the purpose in question. The wood, sawed in small pieces, is digested with hisulphate in large boilers lined with this brick, heat being supplied through lead steam pipes, nothing further being necessary except washing of the fiber. The hisulphate is made on the spot, by passing sulphurous vapor through porous limestone kept thoroughly wet.

JAPANESE CATS AND DOGS.—Some of the animals of Japan are quite different from the same species that are seen in America. The cats, for instance, have the shortest kinds of tails, or else none at all. Being deprived of this usual plaything, they are very solemn pussies. An American once took one of these tailless cats to San Francisco as a curiosity, and it utterly refused companionship with the long-tailed feline specimens there, but finding a cat whose tail had been cut off by accident, the two became friendly at once. Japanese dogs are almost destitute of noses, having the nostrils set directly in the head. The smaller the nose the more valuable the breed is considered.

PRESERVING FISH ALIVE.—It is proposed to preserve fish alive by placing them in vessels partly filled with water and hermetically sealed. It is said that fish so confined have been found alive after three weeks, without either air or water having been changed, while fish in an open jar died in 48 hours. If the air in the vessel is compressed the life of the fish is still further prolonged.

BREEDING RATTLESNAKES.—It is said that a Capt. Daniel Stover, his wife and William Dunn, agent at the Illinois Central railroad depot at Galton, Ill., utilize 40 acres as a farm for breeding rattlesnakes, which they sell to a Philadelphia drug firm for use in concocting a cure for

rheumatism. Capt. Stover's contract with them for the present year called for 250 snakes at \$2.25 each, none to be less than four feet in length or under six years of age. The snakes carry their certificates of birth in their rattles. Some which have had their poison sacs removed are kept about the house as mice exterminators, and are remarkably effective in keeping away the neighbors' children from the premises.

A GOOD RULE IN RIDING ON AN ELEVATOR.—It is a good rule, says an intelligent physician, always to ride up in an elevator, and when coming down to take the stairs. Like going uphill, walking upstairs is hard work, and sometimes risky, especially for people with weak lungs, defective respiratory organs or heart disease. But going downstairs hurts nobody, but is good exercise. Going down on a brisk run is a good thing; it shakes up the anatomy without incurring the danger of physical overexertion. This shaking up is good for one's internal mechanism, which it accelerates, especially the liver, the kidneys and the blood circulation.

A NEW PROCESS OF DRAWING ON WOOD.—A process has been perfected and patented for drawing upon wood by means of a fine metallic point kept red-hot, so that the lines are actually burned into the surface. A powerful oxyhydrogen or other flame keeps the point always at a high temperature, and yet the apparatus is so compact that it may be used with the ease and freedom of a pencil. It is, furthermore, so adjusted as to produce at will all shades of brown, from the lightest to that verging on black.

MORTAR THAT WILL STAND ALL SORTS OF WEATHER.—Mortar made in the following manner will stand in almost all sorts of weather: One bushel of unslaked lime, three bushels of sharp sand; mix one pound of alum with one pint of linseed oil, and thoroughly mix this with the mortar when making it, and use hot. The alum will counteract the action of the frost on the mortar.

KEEPING OFF FROST FROM COFFEE PLANTS.—When a frost is threatened in the coffee districts of Guatemala, the farmers build, in furnaces provided for the purpose, fires of tar, pitch, or other smoking substances, which keep away the frost.

TWO FREDERICS.—There was a Frederic III, Emperor of Germany, before Unser Fritz. He reigned from 1440 to 1493, and enjoyed the sobriquet of "the Pacific." He belonged to the Hapsburgs—the house now reigning in Austria.

LARGE SUNFLOWERS.—Some sunflower plants have been raised in the prison grounds at Carson, Nev., that stand 12 feet high and sport heads that measure 56 inches in diameter.

GOOD HEALTH.

Halth of the State.

According to the monthly report of the State Board of Health for August, reports were received from 51 cities and towns, with an estimated population of 722,600, in which the number of deaths was 908, which is a monthly percentage per thousand of 1.25, or an annual death-rate of 15 per thousand, which is the lowest percentage we have had during the year, and indicates an absence of any serious epidemic diseases.

Consumption caused 138 deaths, over one-sixth of the total mortality.

Pneumonia was fatal in 43 instances—32 of them in San Francisco, 4 in Oakland and 1 each in Stockton, Santa Rosa, Santa Clara, San Bernardino, Nevada City, Marysville and Dixon.

Bronchitis caused 14 deaths, 13 of which occurred in San Francisco and 1 in Trinity county.

Other fatal diseases were congestion of the lungs, whooping-cough, diphtheria, scarlet fever, typhoid, remittent and typho-malarial fever, cerebro-spinal fever, cancer, heart disease, erysipelas and alcoholism.

Although last month was very warm in the interior, cholera infantum was reduced from 60 to 30 deaths, and the number of cases of diarrhea was less.

Reports received from 75 localities continue to indicate a very limited amount of sickness throughout the State, and although during some days within the month the temperature ranged as high as 111° in some parts of the State, not a single case of sunstroke or thermic fever was reported to this office, or, as far as known, occurred within its borders.

Several cases of smallpox are noticed, but no deaths are reported. The report alludes to these cases as follows: "Owing to the exceeding mildness in the character of the disease which developed during the past winter, proper precautions were not taken in those parts of the State, outside the large cities, to properly destroy the clothing, disinfect or fumigate the premises, or render it improbable or impossible for the disease germs to exist in or about those attacked by the disease, many of the cases never going to bed, and others as equally careless of the health of their neighbors. As a result, we may look for an outbreak of the disease when the winter season approaches and these diseased garments are again brought into use. What was mild in its form last winter may be most virulent in its course this winter."

The wisest plan to pursue, then, is to get vaccinated early, and thus anticipate disease by timely preventive measures."

Every care should be taken to destroy all garments which by any possibility may be infected.

VACATION VICTIMS.—The London *Lancet* refers as follows to the folly which some people are guilty of in overdoing things during their summer vacations: "Every year the vacation season claims its quota of victims. Many who have become somewhat enfeebled by long confinement and close attention to the calls of sedentary occupations rush away for a short holiday and endeavor by systematic overexertion to make up for the inactivity of the past months. Every year brings its sad warnings of this folly in a record of fatalities, while the experience of most practitioners shows yet more clearly that this overstrain is followed by prolonged illness. The circulatory and respiratory systems work hand in hand and rebel against any sudden disturbance of their ordinary routine. The danger is always greatest when, in the presence of any cardiac weakness, the exertion demands an arrest of respiration. In moments of intense nervous excitement the breathing is frequently unconsciously stopped, and the strain upon an enfeebled heart then becomes very severe." In reference to the last few lines of the above, the *Lancet* instances a case of the death of a prominent gentleman, Sir John Rose, which resulted from sudden over-excitement, as follows: The gentleman had already fired twice at a stag in the hunting-grounds, and when aiming a third time suddenly expired. Emotional excitement necessarily produces palpitation, and the fixation of the thorax then adds to the difficulty at the moment when the heart is at its weakest.

EDISON AND THE YELLOW-FEVER GERM.—Mr. Edison, the inventor, thinks he has found a method of exterminating the yellow-fever germ. It is to sprinkle caustic soda and gasoline throughout the infected city. Said he recently: "Gasoline has the peculiar property, besides reducing the temperature and thus killing the microbes, of displacing the water in all organic matter, causing it to perish; but as gasoline is not easily absorbed by wet ground and would probably fall in a measure to do its work, I have discovered that caustic soda will answer the purpose in these instances. The microbes, being organic, must contain fatty acid, and caustic soda will saponify anything containing fatty acid; so in a wet place I would liberally sprinkle caustic soda, which could be done at a very small cost with the aid of a street-sprinkler. Hills and dry places could be protected with gasoline." Mr. Edison thinks that with \$5000 he could cover Decatur with gasoline and caustic soda an eighth of an inch in depth. The examination of yellow-fever germs will probably be a prominent study of medical students this fall, as some physicians in Jacksonville are preparing specimens to send to various medical colleges in the North. It will be fortunate if a remedy or preventive is discovered.

THE USE OF WATER ON THE SCALP.—"People become bald from washing the head," said an English barber. "The use of water on the scalp may make a man feel buoyant for a time, but you will notice that the hair becomes dry and brittle afterward. The water and subsequent rubbing with a towel, dry up the oil in the roots, and in time the hair becomes dead and drops out. In England people never think of washing the hair. A good comb and stiff brush are all that are needed to keep the head clean. The women often spend hours in combing out their hair, and that is the most laborious part of a maid's work. Instead of shampooing, English barbers use a machine shaped like a little barrel and covered with stiff bristles. This is run by a small gas engine, and will winnow every speck of dirt out of a man's head in a few minutes. I have heard there are some in use in this city, but I have never seen one."

"HARDENING" CHILDREN.—There is a tolerably general impression in many quarters that in order to promote the health of children it is advisable to subject them to a "hardening" process. The aim is to encourage native energy by opposition, to engender strength of mind and body by early participation in the struggle for existence. The principle is in itself a wholesome one, and is not without its parallel in the history of nature's processes. Care is most necessary, however, in its application. Without such care it may be, and frequently has been, overdone. In particular must it be remembered that all success in the adoption of this plan in education depends on the possession by a child thus trained of a basis of sturdy physical vigor. A delicate child, if similarly treated, would languish and succumb.

HOW THEY DISINFECT FLORIDA MAILS.—In order to fumigate the mails which leave Jacksonville, Fla., they are emptied loose into a large box, which has a wire bottom, and kerosene and other disinfectants are burned under the box from 8 to 12 hours. All the smoke from the burning matter has to pass through the mails.

SPEED OF METEORS.—While the most rapid cannon shots scarcely attain a velocity of 600 yards a second, meteorites are known to penetrate the air with a velocity more than 80 times as fast—from 40,000 to even 60,000 yards per second, a velocity which raises the air at once to a temperature of 4000 to 6000 Centigrade.

The Kootenai District.

A Mining Camp in British Columbia.

A gentleman who has just returned from the West Kootenai mining district, in British Columbia, furnished the *Butte Miner* some particulars of this camp. The district lies about 50 miles north of the Idaho border, on both shores of Kootenai lake, which lies about north and south. The lake is 100 miles long and 15 wide at the widest near the center. The Kootenai river, which rises in Montana, flows through Idaho and northwesterly across the border to the southern end of the lake. The outlet of the lake is about the center and flows westwardly into a fork of the Columbia from the west side of the lake. The West Kootenai mining district lies north and south of the outlet, and on the opposite or eastern side of the lake. Salishury is the town that furnishes this district with its supplies. It is on the south bank of the outlet, a few miles west of the lake. The district is reached from the American side by the Northern Pacific. Leaving Kootenai Station, a couple of miles east of Sand Point, a wagon-road runs to Bonner's Ferry, 80 miles north on Kootenai river in Idaho, which runs northeast into Kootenai lake, and is navigable for boats of considerable draft. A steamer plies between there and Salishury. The trip can be made from Butte in three days and a half.

On the east side of the lake, north of Crawford's bay, which is directly opposite the outlet, the ore is silver in a galena formation, and the Blue Bell is the principal mine here. On the west shore the formation is galena and carbonates of both high and low grade. The silver ore is most plentiful through the district. High-grade ore from the Silver King and Kootenai Bonanza have been shipped from there to Anaconda with good results, and yesterday a shipment of 20 tons arrived in Butte to be reduced here. A shipment of galena ore was made last spring to Omaha with returns of \$220 silver and 17 per cent copper to the ton. But gold and copper have been discovered, the latter this spring, of a very high grade. The copper and gold lie between Cottonwood creek, that flows to the outlet of the lake near Salishury, and old Forty-Nine creek, further west, also an affluent of the outlet, where very good placer mining existed years ago. The gold is free-milling quartz, and has assayed from \$8 to \$1400 a ton. The gold ledge are very extensive. The Golden King has a ledge 150 feet wide and of unknown depth. It is traced the full length of the claim. The ore is free-milling and assays an average of \$43 a ton.

The location laws are pronounced simpler than those in this Territory. Quartz claims are the same size as here, 1500 by 600 feet. Twenty-five days' work a year have to be done to represent a claim, or a hundred dollars' worth of work at \$4 a day. Heavy fines are the penalty of making affidavit that work has been done without doing it. It is a punishable offense, after stakes are once fixed and the claim recorded, for any one to move the stakes without permission of the Gold Commissioner. The latter is an all-powerful autocrat, more on the Spanish than the English pattern, whose will is law and who can sentence an offender off-hand without judge or jury.

The winters are not very long there. This year the ice was off the river by the 20th of March. The country is heavily timbered, and, as may easily be supposed, there is plenty of water.

HAYSEED MINERS.—There are many kinds of miners found in our different camps. There is the genuine old-timer, who began his career in '49. From him the scale is graduated down to the green tenderfoot just arrived from the States, but worst of all is the hayseed miner; he who leaves his ranch and starts out on a stampede, expecting to strike it immensely big and return the possessor of untold wealth, so he can awe his less venturesome neighbors by his aggregated wealth. When a number of these people get into a new placer camp they generally pass their own district laws and stake out claims as near the size of the ranches they left behind them as the United States mining laws will permit; then the trouble begins, as they can generally outvote the experienced miners near them. In the quartz camps they are a drawback also; they get a prospect that shows some indication of mineral wealth. Because a well-developed mine sells for a high figure, they imagine that theirs is just as valuable. They will not dispose of it or hand it for any reasonable figure, the representatives of capital they look upon as little less than thieves, they hang on to their claims, and very seldom make them productive; their actions drive capital out of the camp, and quite often the hayseed miner packs his blankets back to his ranch to find that it has sorely needed his attention. He abandons his prospect, applies himself to his farm when the experienced miner relocates his claim, develops it and sells for a good figure; then the hayseed curses mining and pronounces it a delusion and a snare.—*Spokane Falls Herald*.

GRAFTING WHITE SKIN UPON BLACK.—There is a negro in a New York hospital who has a patch of light-colored skin on his back. It was grafted there, he having lost the original cuticle by falling against a roller in a shoe factory. The pieces were taken from the arms of a young medical student. At first the transplanted skin remained white, but it is said to be slowly turning black.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

SUTTER CREEK.—Cor. Amador Ledger, Sept. 29: At the Wildman mine the station at the 600-foot level is about completed, and drifting in earnest will be inaugurated shortly, and all expect to hear of some good discoveries in the near future. Timbers, spiling and other winter supplies are coming in daily. At the Iowa work has become active again on account of getting a supply of water sufficient to run the mill, and it is hoped to be able to run the mill steadily. In drifting east at the North Star a ledge of good dimensions has been encountered at a distance of 100 feet from the shaft. The ledge is about five feet thick and somewhat split up. The general opinion is that as soon as it becomes solid and well defined the rock will pay.

Calaveras.

THE UTICA MINE.—Mountain Echo, Sept. 26: Preparations are making for the erection of the new hoisting works on the south shaft of the Utica mine. The derrick to be used for raising the large timbers into place was put in position during the week. The works to be erected on the south shaft will be of the same dimensions as those on the north shaft. Messrs. Rider and Lee are now at work framing timbers for the new 40-stamp mill to be built in addition to the 20 now in use. A scene of general activity prevails at the Utica day and night.

Mariposa.

RED CLOUD.—Mariposa News, Sept. 22: After about one week spent in repairing 10 stamps of the Red Cloud mill, it started. They have a large quantity of good ore in the mill and the returns are hoped to be very satisfactory. They have started two drifts, one east and one west from the bottom of the shaft in the Red Cloud.

A GOOD MINE.—Gazette, Sept. 29: Our informant visited the Storey mine about seven miles east of Coulterville one day last week. It belongs to Wm. Warner and Ed Weaver, and was located in 1885. They have a shaft sunk about 70 feet which shows a vein with good walls, and at the bottom of the shaft the vein is 2½ feet thick and carries free gold. With the assistance of capital this good quartz vein would no doubt develop into a valuable mine. There are many valuable quartz veins which are located and being held by the locators in the county, which capital could command, no doubt, if sought after.

RED CLOUD.—Mariposa News, Sept. 29: The Red Cloud company are repairing the remaining 12 stamps of their mill and will be ready to run their full 22 stamps as soon as there is water to do so. On Tuesday of this week Arthur Shimer bailed the first load of lumber to be used in constructing hoisting machinery at the Bondurant mine. It will take about 40,000 feet.

WHITLOCK'S.—Messrs. Moore & Helm have seven tons of good-looking rock out. They started their mill Wednesday for a short run. Helm Bros. have about 25 tons of ore out of the Triumph. They were recently offered \$1000 for it but refused. Good ore that.

BEAR VALLEY.—The sinking of the shaft on the Winner has ceased for the present; too much water. Indications good. About 60 feet of the Pine Tree ledge has been uncovered, and it is rich.

Nevada.

A BONANZA.—Herald, Sept. 25: From information received from the California mine, near Graniteville, it appears that a perfect bonanza has been unearthed. Reports state that in the lower tunnel the ledge has been found to be simply immense in size and very rich in gold. Rumors place the width of the ledge all the way from 17 to 30 feet, and a run of 16 days yielded \$19,000. The owners, Mr. Patrick Foley and M. Bohannon, have reason to be very jubilant over the prospect.

MORE STAMPS.—Tidings, Sept. 29: In view of the fact that the North Star company has more quartz coming out of the mine than the 30-stamp mill can reduce, ten stamps are to be added. The addition will not be expensive, nor will it require a lengthy period to complete, for when the mill was built provision for two extra batteries (ten stamps) was made.

A NEW FIND.—Herald, Sept. 29: The Kistle Brothers have for the past two years been prospecting a ledge located near the Charonnat mine, about a mile and a half from this city. They have been engaged in running a tunnel during all the time, to strike the ledge, and day before yesterday reached it. The ledge is at present small, being about six inches wide where tapped, and its richness is not yet fully known, but the owners think they have made a good find. It is in a good district and has every convenience for cheap working.

COLUMBIA HILL.—Quartz is booming on the Ridge and now is a good time to invest. The Seneca company have a two-foot ledge which is said to be rich in free gold; Cherokee has consequently received quite a boom. Geo. Baker and J. A. Jones have been working on the Golconda for the last couple of weeks. At a depth of 20 feet they have struck a 5-foot ledge which prospects exceedingly well. They are well pleased with their prospect and feel greatly encouraged. The El Dorado company are still driving their tunnel ahead, but as they have very hard rock it is slow work. J. A. Craig is prospecting for gravel near the Eureka Lake company sawmill. He has an incline down about 30 feet and expects to strike the gravel within the next five or six feet. Mr. Craig deserves to strike it rich, as he has done a great deal of prospecting in the last couple of years.

NEVADA CITY MINES.—Transcript, Sept. 29: At the Providence, 20 stamps are pounding away on a good quality of quartz from the lower workings, where there is said to be one of the best ore bodies ever developed in that mine. On Monday the company will put at work a score or so of miners who have already been engaged, and it is hoped that before next spring this extensive and valuable property, which has admittedly been one of the most potent factors in the city's prosperity of late years, will be working as large a force of men and turning out as much gold as it did previous to the labor troubles of

last year which led to its operations being circumscribed. The Nevada City mine, which had been employing in the neighborhood of 50 men when last February it was compelled to shut down on account of a lack of working capital and bad management combined, is in a fair way to be started up again within the next 30 days. B. N. Shoecraft, the company's secretary, has for several months been negotiating with the directors and stockholders for a lease of the mine; Eastern parties having positively assured him that in case he could obtain it they would advance the funds necessary to pump out the water and resume the extraction of ore, it being part of the agreement that the company shall apply the proceeds of the lease to the payment of the claims against them. Mr. Shoecraft learns that the company favor the plan, and their written consent to the agreement is daily expected. When it arrives the negotiations with the Eastern parties will be completed without delay. It is the intention of the lessees to put the hoisting, pumping and milling machinery in thorough repair. The mine has been well opened to the 800-foot level, where there is a 350-foot chute of pay ore that shows considerable improvement over that found in the level above. A station has been cut at the 1000 level, and the program is to start new drifts at this point, as well as to continue working the ledge above there. At the Spanish, just north of the Nevada City, a small force of men is at work. They have a good chute of ore and there is on the dump a crushing of ore that has every appearance of paying well. The Mountaineer is running regularly with encouraging results. The Champion Co. is steadily forging ahead in the matter of opening new ground. They are sure to eventually reap rich reward for their pluck and enterprise. The representative of the Chicago and Loudon syndicate who a few days ago hounded the Merrifield and Charonnat mines says that some of his principals will arrive here shortly to make a critical examination of the properties. If they are favorably impressed, as he seems certain they will be, these two old-time producers will soon again be in full blast. The bonds have four months to run. The reorganized Murchie Co., doing business under the name of the Lone Star Co., are busily engaged in perfecting their plans for putting the property on its feet again. Several valuable ledges are included in the boundaries of the claim, and past work on them has demonstrated that they are of good size and quality. The other claims in this district on which work is being done are looking well, and a number of prospects that give bright promises are being quietly developed. Taken all in all, the outlook for Nevada City's quartz-mining interests is far from gloomy.

MORE STAMPS.—Tidings, Sept. 22: Sixty-five men are now employed at the Omaha & Lone Jack Consolidated on day's pay, and all the underground work in progress is confined to the Omaha shaft. This is 700 feet in depth, while the shaft in the Lone Jack ground pinches 600 feet. Both are clear of water and have been placed in good repair. A drift to connect the two at the 400-foot level of the Lone Jack is being pushed from both shafts, and a fortnight will see the job accomplished. The ore is paying for all development and deadwork done, and of the latter there has been a great deal. Workmen are now engaged in adding eight stamps to the ten-stamp mill, and in removing the old wooden overshot wheel heretofore employed in furnishing motive-power and replacing it with an eight-foot Pelton wheel. Within a week the new wheel will be in place, and within two weeks, or three weeks at the outside, 18 stamps will be running night and day on ore of good quality. The quartz extracted is coming from virgin ground and the outlook justifies the belief that Grass Valley will within a short period add another dividend-paying mine to its roll of honor.

Plumas.

STRIKE AT BUNKER HILL.—Plumas National, Sept. 22: Last Saturday the men at the Bunker Hill mine, near Pilot Peak, stopped work on account of the company passing an order or resolution on September 1st that any miner working for the company after that date should take scrip for pay until July next, and that what came out of the mine should go for dividends to the stockholders. The mine is situated at an altitude of about 6000 feet. Still the miners think that "wind pie" is rather thin for the next ten months. Three of the miners wished to work on the company's terms, but the discontented ones kept them out of the mine.

San Diego.

OWENS.—Julian Sentinel, Sept. 25: It is doubtful whether or not the Owens mine will start up for some time.

PACIFIC.—The Pacific Mining District is a fraud. **JULIAN.**—Sentinel, Sept. 29: Several of the small mines are looking splendid this week. Three or four of them have commenced hauling ore to the mills. The Gold King and the Gold Queen are extracting rich ore.

REDUCTION WORKS.—National City Herald, Sept. 27: The reduction works are forging right ahead, and are beginning to attract much attention throughout the country. Communications are being received by Superintendent Chick from all sections concerning ore shipments and when the works will be ready to make contracts. Large quantities of ore are being brought to the city from the mines for mill tests, which are being made daily. We are glad these works are going up, and wish they were twice the size they are, for there is more work in San Diego county than they can do.

Sierra.

RIVER MINING.—Mountain Messenger, Sept. 29: In the early days of California, river and bank mining was nearly all the mining that was done. For the past 10 or 15 years, however, this species of gold-hunting, with here and there a lonesome exception, has been in the hands of the Chinese. One of the few bank claims still in the hands of a white man is located on the South Fork, about half a mile above China Flat, and is owned and worked by George Woolford. George has been on the South Fork, as miner and prospector, for the past 20 years or more. The claim, of which he owns about 1000 feet, was once, and geologically speaking but yesterday, the bed of the present river. The cause of the abandonment of its old bed by the river is patent to any who care to observe. When the river had dug its bed nearly to its present level, an immense mass of earth and rocks slid into the canyon and filling and covering up the old bed, forced the river to make a

new bed. This particular bit of old channel has had many owners, but none of them had the luck to hit the right spot. Five years ago Mr. Woolford located the ground, but it was not until the spring of 1887 that he seriously undertook its development, and owing to a short season and the large amount of preliminary work necessary, not much prospecting was done. His power was also inadequate. Last spring he sunk a pit about 30 by 40 feet in size, using a 32-foot pump driven by overshot wheels. Some four weeks ago he got his pit bottomed, taking out over \$400. He then started a tunnel up stream, which is now in 20 feet in good pay all the way. In one place as much as \$84 to the pan was obtained. Last week he took out about \$500. Recently two ounces of gold was shown to Mr. Jaynes as the product of one pan of dirt from a streak of soft bedrock. George is now getting a car and other things necessary to putting on a force of men. The car will be drawn from the pit and water pumped by water-power. The old river-bed is far enough above the present river bottom to be entirely out of the way of high water, and there is nothing to prevent work being carried on the year round.

Siskiyou.

RIVER MINING.—Yreka Journal, Sept. 26: Nearly all the river mining companies at the Klamath are now sinking down new cuts from the surface, keeping the full force on one cut, instead of dividing them on different cuts as in former years. By working down on one bench it is believed more work in raising gravel can be accomplished, as the machinery can be regulated to work at a single place with less danger and difficulty than hoisting from different places.

QUARTZ.—Thomas & Morris, discoverers of a quartz ledge in the Beaver creek district, in the Siskiyou mountain foothills, have been taking out very rich quartz lately, with good indications of their find being a permanent ledge. John Saxild has found a very rich quartz ledge about quarter of a mile up the mountain from the Centennial claim at Klamath river, in which gold is plainly visible to the naked eye in every portion of the quartz that is taken out. A good ledge at that point could be conveniently worked by having a water-mill at the river and sliding the quartz down to it.

HUMBURG CREEK.—Yreka Journal, Sept. 26: An expert from Portland, Or., named Cooley, visited Humburg creek last week in the interest of Oregon capitalists, to look at the quartz mines in that section. He thinks it is a good country for mining, and by thorough prospecting rich and extensive ledges can undoubtedly be found there.

Tuolumne.

GOLD.—Union Democrat, Sept. 29: Several parties are striking gold on Bald Mountain at present and there is every evidence that this winter will see large results in pocket mining. We are told that Mr. Bowman has resumed work on the Quartz Mountain mine and that a large force of men is at work in the shaft and stopes. This mine is a low-grade proposition, but the efficient superintendent, Mr. Bowman, has made it yield a dividend to the stockholders ever since he has had the management of it.

BLACK OAK.—Having received an invitation from Messrs. W. G. and Proctor Scott of the Black Oak mine, we visited that mining enterprise last Sunday. Mr. W. G. Scott showed us all over the mill and attendant works, and we must state that the entire institution is a representative one in every respect. The mill has ten stamps, but they are run at such speed and have such drop that 19 tons per 24 hours are crushed. The ore is received at the top of the mill building, passed over grates or grizzlies, where the finer particles fall down through into a bin and thence into the ore-feeders. The larger pieces pass beyond the grizzlies and down into a rock-breaker, from whence a passage is effected to the ore-feeders. The sand coming from the batteries passes over two rows of silver-plated copper plates, which collect the residue of amalgam. From there the sand continues on and is fed directly to four Frue concentrators. Mr. Scott then thinking that particles of sulphurets which were infinitesimally fine were not caught by the concentrators, employed the Morris device, which consists of a number of tables placed side by side, each about 18 inches in width and provided with canvas floors whose interstices catch the sulphurets as they pass downward with the water. The entire mining plant is economic, systematic, intelligently and progressively arranged. The ore from the mine is now highly sulphureted. The shaft proper is now down considerably over 200 feet, has splendid walls and the lead is about three feet in width. The chutes are of good length and indicate a strong lode. About 40 men are employed altogether and the scene presents a lively appearance.

NEVADA.

Washoe District.

CROWN POINT.—Virginia Enterprise, Sept. 29: Have completed the drain in the 700 crosscut and advanced the drift 15 feet since last report. The face is still in quartz of about the same character and value as reported last week. There are about two inches of water running from the face. The Suto tunnel drift is out 795 feet. The total distance to be run is 950 feet, leaving 165 feet still separating the two drifts.

HALE & NORCROSS.—On the 500 level the main west drift from the shaft has been advanced 35 feet, making its total distance 430 feet. The south drift on this level has been extended 20 feet and connected with the south upraise from the 600 level. The north upraise above this level has reached the 500 level, and a north drift has been started therefrom to connect with the 500 level south drift from the Savage mine. The west drift from the new station, 800 level, has been extended 40 feet, making its total distance 120 feet.

SAVAGE.—On the 400 level the southeast drift has advanced 18 feet. The drift is in a heavy, swelling clay formation, which requires close timbering. On the 500 level the south drift has been advanced 35 feet. Are saving the material from the drift for pay ore. Have cleaned out and repaired the south drift on the 950 level and have resumed work in the face. Have men on repairs and easing timbers in the shaft and on the different levels of the mine.

CLOSED.—As the Consolidated Imperial, Challenge Consolidated and Confidence mines are closed down pending the repairs to the hoisting works at

the Yellow Jacket shaft, through which they are all worked, there is nothing new from them.

BELCHER.—Are still engaged in cutting out the station commenced last week. The Suto tunnel drift is out 785 feet, leaving 165 feet yet to run to connect with the joint drift from the Crown Point incline.

POTOSI.—The south drift on the 650 level has been advanced 23 feet; total, 423. The face is in quartz, giving low assays. The west drift is in 21 feet. The face is in porphyry.

SEGREGATED BELCHER.—The south raise advanced 18 feet since last report, making the total 170 feet. There is no change to report of the ground run through.

ALPHA AND EXCHEQUER.—The east crosscut on the 382 level of Exchequer is out 130 feet. The east drift in Alpha is out from the old shaft 134 feet.

BALTIMORE.—Are still operating on the 338 level. The machinery is working well and there is no trouble to handle all the water that comes in.

CHOLLAR.—The drift west from the 350 station has been extended 47 feet; total, 80. The face of the drift is in clay and porphyry.

JUSTICE.—The work at the new mill is progressing well. Are steadily hoisting ore from the different reserves in the mine.

BULLION.—Running east on the 500 and 'south on the 640. There is no change in the character of the ground to report.

ALTA.—The mill is running steadily on ore from the 825 and 1150 levels, which continue to look well.

SCORPION.—On the 300 level west crosscut, No. 1 has been extended 8 feet; total, 50 feet.

ANDES.—Are repairing the shaft.

Pioche District.

YUBA.—Pioche Record, Sept. 26: Work has gone on regularly in the Yuba mine since our last report. The winze on the eleventh level has been extended to a depth of 30 feet and the crosscut on the twelfth level has been run a distance of 55 feet from the shaft, bringing it to within about 25 feet of the middle ore vein. The crosscut on the 8:30 level has been extended into the north vein and drifts on the vein east and west have been run about 25 feet, showing a well-defined fissure in quartzite walls in the face of both drifts, filled with ore averaging over 100 oz. in silver and 40 per cent lead. The working force is gradually being increased in this mine, and while no boom has yet followed its developments, a steady growth is observable.

Osceola District.

DRY WASHING FOR GOLD.—Salt Lake Tribune, Sept. 26: Duff Brown from Osceola, Nevada, tells of the wonderful doings down there of a gold-washer newly invented by Los Angeles talent. The machine works by the dry process, the drier the gravel the better it works. It does not weigh over 150 pounds, costs \$125, and can put through 30 tons of dirt every 10 hours. One man can turn the wheel easily, and for a country where it is difficult and expensive to secure an abundance of water, this machine is said to be the very thing. The one at Osceola is panning out in a way that is astonishing the miners. The machine separates and collects the free gold irrespective of fineness or shape from gravel, sand, loam and other debris. It is operated by hand or other power, and is said not to check in the heat. The dirt, after being put into it, passes through a hopper over a set of rifles, the bottom of which is formed by a fine meshed brass wire screen. The turning of a crank operates a double pair of bellows beneath, which forces a constant and strong blast of air through the meshes, blowing the dust out, the heavy gold falling to the bottom. It can be divided without difficulty to facilitate packing on burros. The miners speak highly of the device.

Hawthorne District.

PROSPECTING.—Virginia Enterprise, Sept. 26: The mountain ranges in the vicinity of Hawthorne afford one of the best fields for prospecting miners now open in this part of the State. Though the majority of the veins are small, they are generally very rich. Very few prospectors who have gone to work in earnest and industriously searched the hills, have failed to find a reward for their labors. As the veins pay at or near the surface, it is a good camp for men of small means, and when a man once gets a start there he is almost sure to hang on; one find leads to another—his first rich pocket does not knock the bottom out of his mine.

ARIZONA.

BRADSHAW.—Cor. Prescott Courier, Sept. 25: The mining interests of Pine Grove district are in a flourishing condition. Work is the order of the day, which is being done with telling effect. The Crowned King Co. has been developing its mines for the last year and putting in machinery. They now have one of the best developed mines and most complete mills in the county. Much credit is due Mr. N. C. Shelds, under whose management this work has been so successfully accomplished. The Oro Bella Co. has opened up a very promising property, and are now making roads to bring in their machinery. All through the district there is every evidence of a big boom in mining interests. Wm. Brittenham has about completed a tunnel on his rich ore body; Jake Henkle's mines still keep up their reputation, and he is now taking out lots of high-grade ore; the Lison boys' mines are showing up better than ever; E. S. Junior is as usual taking out very rich ore; he has a bonanza; Sines & Elliott have a fine property and are rapidly opening it up; the Boaz Co. is pushing work on its property and expects to have its mill in running order in a few weeks. Dumps and storerooms of the Arizona Ore Sampling Co. are big with ore. Mr. McGowan, superintendent of the Senator mine, has his big shaft down 90 feet in good ore. Stamps are being set up in Mr. Kerr's mill at Antelope. Riggs & Lawler, owners of the Hillside mine, near the Santa Maria, have purchased a complete smelting plant and will shortly have it up and at work. Their ores, as well as a majority of ores in the district, can be smelted with ease. Dan O'Boyle has his force at work, developing new places in the Montgomery mine. H. M. Hughes has a 60-foot tunnel in the Ground Hog mine, Walker district.

RICH ORE.—Prescott Courier, Sept. 29: The Arizona Ore Co. of Prescott has shipped 402,000 pounds of rich ore, containing gold, silver and lead,

since September 1st. The company shipped to-day by train 70,000 pounds. Receipts of ore for the last three days, 87,542 pounds. Company has been paying from \$15,000 to \$25,000 per month. Shortly after Mr. Cockburn started the plant, a great many people said the mines would not afford sufficient high-grade ore to keep the plant busy, but they have and will continue to do so. Realizing the good the company has done the country, the *Courier* hopes it will, ere long, put in a plant that will be able to work low-grade ores, of which there are hundreds of thousands of tons in mining districts near Prescott. E. G. Wager, a well-known citizen of Tip Top, is in Prescott. His district produces very rich silver ores, and has for years been a great shipper of such ores. It is now very prosperous. The Smithlines are shipping ore that yields 1000 ounces of silver to the ton. Mr. Wager came through Bradshaw, Peck, Turkey creek, Hassayampa and Groom creek districts and found the miners nappy. At Bradshaw basin Mr. Shelles showed him the mill dumps. Oro Bella Co. people were in fine spirits. He saw about 50 men at Alexandria, Peck district. Cy. Curtis was exhibiting specimens from a point mine he had just located. Messrs. Van Name and Robeson are here from Big Bug district. Van Name's mill is doing good, safe work. Three big bars of silver bullion were brought here by Mr. Robeson. They are at the O. K. Robeson & Foster are assorting several carloads of Middleton mine ore for shipment by the Arizona Ore Co. Shull & Austin's teams have just brought to the works 25,000 pounds of rich gold sulphuret ore from the Congress mine. These sulphurets are worth over \$150 to the ton in gold. Superintendent Thompson will soon be running three smelters at Jerome. A steam hoist, smelter, etc., will shortly be erected on Lower Big Bug. Bigelow & Smith, Frank Kuhne, Dan Hatz and scores of other miners are taking out shipping ore. Fred Williams is expecting orders to place more men at work on the Storm Cloud.

CAMPS AROUND PRESCOTT.—*Journal-Miner*, Sept. 29: The Congress still continues to look well in all its shafts, winzes, drifts and tunnels. I. T. Stoddard has men engaged in building a road from Minnehaha to the Oro Bella company's mines. Eight carloads of ore have been sent out from the sampling works during the first two days of this week. John Lawler yesterday received \$1800 as net returns from a carload of ore shipped from the Hillside mine. Magnus Moe has deeded a half interest in the North and South Consolidated mining claim to J. E. Floyd, for \$500. T. Otto has sold one-fourth interest in the Perry mine to Charles Cappel for \$500. John Lawler et al. have sold to Nathan Levy et al. one-half interest in the Robert E. Lee, Lucky Cuss and Eagle mining claims, for \$5000. Chas. H. Akers brought in nearly \$200 worth of gold a few days ago from Cherry creek, the result of a short run made by Richard DeKuhn in his arastra. J. M. W. Moore of the Prescott sampling works reports the shipment of 18 carloads, nearly 200 tons, of ore since September 1st, and they have several carloads stored in their bins. An immense body of high-grade ore, said to be larger and richer than any ever encountered before in the property, was recently struck in the McCracken mine, Mohave county. It is a fact worthy of note that of some eight or ten stamp-mills in this county, which were lying idle a few months ago, there is not a single one now that is not either in active operation or in process of repairs looking to an early start. J. W. Wilson returned to-day from a visit to the Howard and Senator mines. Messrs. Harlan & Barrington, of the former, are only able to run their mill about two hours per day, owing to a scarcity of water. The outlook for the erection of reduction works in Prescott at an early day is splendid at present. Should the proposition recently submitted to the Colorado parties be rejected, there are others who are prepared to put in a plant, provided a donation of \$15,000 in ore is guaranteed them. Messrs. Fisher & Dunkle have their new steam hoist for the Scotch Lassie mine on the ground. Messrs. Smith & Hartin, who own the Oversight mine in Kirkland valley, received a sample of ore yesterday from their claim which assayed \$80 in silver and about 60 per cent in lead. John McDermid came in last evening from the lower end of Slaughterhouse gulch, where he has been engaged in building an arastra to be run by water-power, with which to work the ore from the Dolly Varden mine. J. W. McGowan, superintendent of the Senator mine, reports work progressing finely on that property. A very fine body of ore some two and a half feet in thickness was encountered in the new shaft at a depth of 90 feet. Mr. Shelles, of the Crowned King company, has 50 mules employed in packing ore from the company's mine to the mill.

COLORADO.

OURAY MINES.—*Denver Tribune Republican*, Sept. 22: A *Republican* representative met Mr. Lou N. White from Ouray, the other day, and in conversation gleaned a few interesting pointers on the present outlook in mining circles in that section. Mr. White is one of the fortunate owners of the Carbonate King mine in the Red mountain district, and is one of San Juan's best-posted men on mines and mining. He says the condition of the mining industry of Ouray county is first-class and 100 per cent better than that of any previous year. The advent of the Denver & Rio Grande railway into the county and town of Ouray from Montrose, and the building of the Mears railway from Silverton into the county and the Red mountain mining district, has infused new life and activity into the mining industry in that section. The tonnage output for this year will double that of any previous year. There has been considerable activity in mining sales in all the districts in the county, and the purchasers are largely St. Louis capitalists who have been singularly fortunate in their investments. Among the large number of properties which they have purchased can be mentioned the Saratoga, Vanderbilt and the Genesee, in the famous Red Mountain district; the Ruby Trust, United States Depository and the Humboldt, in the Mount Sneffels district; the Saxon (recently sold by Senator Tabor for \$50,000), the Amador and Lily, Bonanza, Maid of the Mist and the Forest, in Poudrekeepsie. These are only a few of the most prominent mines placed in St. Louis. Many other properties of less importance have been placed in various Eastern money centers, and many other sales are pending at the present time. In consequence of the great activity in mining circles, the

town of Ouray and the entire county have increased wonderfully in population and wealth during the past year. Among the regular heavy producers are the Yankee Girl, Vanderbilt, Genesee, Carbonate King, Maud S., Belle of the West, Saratoga, Virginus, Terrible, U. S. Depository, El Malid, Dexter, Old Out, Iowa Chief, National Belle and scores of smaller producers. A great deal of prospecting is being done among the hills, and encouraging discoveries are of daily occurrence.

IDAHO SPRINGS.—*Idaho Statesman*, Sept. 23: The Idaho custom-mill is being supplied with more ore than it can treat, and is pounding away day and night. The Rover Mining Co., consisting of Denver and Chicago parties, has resumed work on the Rover mine up Fall river. The Mary Foster and the Humboldt have been consolidated, and will be operated extensively by a strong company. During the month of August, the sampling works of Matthews & Co. shipped 1,613,068 pounds of ore, containing 15,112 ounces silver, 1414 ounces gold, 48,113 pounds lead and 5900 pounds copper. The Silver Age Mining Co. is pushing developments in both shaft and tunnel. The main shaft has now reached a depth of 300 feet, the last 63 feet of which have produced over \$3,000,000 net. Lesses on the Lake lodge, up Virginia canyon, are making a 100-ton shipment of ore to the Stevens concentrating mill at Lawson, for the purpose of ascertaining whether it will pay to mill the ore regularly, instead of shipping it direct to the smelters in its crude state as they have been in the habit of doing. Parker & Brushwood have a very complete little stamp-mill on Chicago creek just below the mine.

DAKOTA.

BINGHAM.—*Deadwood Pioneer*, Sept. 26: This claim, which created such a furor in mining circles several months ago, has been lying idle for some time, but is now the scene of considerable activity. Five men were put to work upon it Monday, and this force will shortly be increased very materially. The owners intend to develop the mine thoroughly, and have renewed operations in a manner which will undoubtedly fully compass their intentions.

TIN.—During the next three months the Harney Peak Tin Mining Co. will pay out for mere assessment work on its Pennington and Custer county mines not far from \$40,000. This money will be divided among many miners and prospectors in this portion of the hills. Who will say that such a company is not of great benefit to the country?

DAVEY SMELTER.—*Deadwood Pioneer*, Sept. 27: The old Davey smelter, now belonging to the Merchants' National bank, has been leased to Sheridan McBratney and others of Galena. While the public is not positively informed, the general impression is that the plant has been taken for the Queen company, and that when fires are started, it will be to smelt ore from the Queen mine. Owners in the Queen are positive that their mine can alone supply enough ore to keep the plant operating to full capacity. However, we are informed the purpose will be to do a custom business; purchase what ores other prospectors or corporations may have to sell, and thus aid and hasten development of many promising locations in the district. The enterprise is one that will commend itself to the majority of Galena mine-owners. There are half a dozen different properties in the district upon which a large amount of development has been accomplished, disclosing ore-bodies of greater or less proportion. The average value of ore is about \$30. The mines referred to can easily supply a plant double the capacity of the Davey smelter, without necessarily presenting for draft on locations on which only limited exploration has taken place.

IDAHO.

ORO FINO.—*Idaho Avalanche*, Sept. 25: The new Oro Fino mill is now running on ore from the Oro Fino mine, which is turning out well. The concentrator is saving nearly all the gold at little cost. If, as it is now supposed, a concentrator will save the precious metals, the solution of working ores in this camp has been solved.

ABOUT ORE TAXES.—*Bellevue Herald*, Sept. 27: J. V. Parker, freight agent of the U. P., at Salt Lake, is in Bellevue to-day to see about the rumored raise of \$1.60 on the ton for smelting charges on ores by Omaha companies. Mr. Parker does not understand why the Omaha smelters should make this increase when the railroad folks have just encouraged the country by a heavy reduction in freights. The poor and small mine-owners are the only ones to suffer by this increase, as yearly contracts are made by the larger mines here.

ROCKY BAR.—*Idaho Statesman*, Sept. 20: The water is very low in the streams of Western Alturas. We learn that Harry Thompson went over from Silver Mountain to Rocky Bar on Thursday last, and on Friday was hiring every carpenter he could find in the Rocky Bar country and vicinity to finish the Silver Mountain mill. J. M. Texton, the great mill builder, has been employed for the finish. Thompson tells wonderful tales of the richness of one of the company's mines. He says one lode will go \$60 to the ton and will average five feet wide. A large number of carpenters accompanied Mr. Thompson on his return Saturday morning. There has been considerable excitement in Rocky Bar over a mill test of ore made from the "Mountain Goat" lode during the past week. Forty-eight tons crushed at Jake Reeser's custom mill has turned out nearly \$100 per ton. The New York Co. has leased Mr. Reeser's mill, and after putting on about \$3000 worth of improvements propose to proceed further. This result has enlivened the camp very much, and has given a great impetus to prospecting.

SILVER DISTRICT.—*Statesman*, Sept. 26: A good many conflicting reports come from Graham, Silver district. The 20-stamp quartz-mill which has been in process of erection for a year is finished, or about as good as completed, and ready to run. A ditch has been constructed to run the mill by water, about two miles long, from North Fork of Boise. A tramway has also been constructed to run the ore to the mill, a mile distant. It is said that the mill and works are the best in the Territory. The only question about the success of this great enterprise is in the mine; while many report plenty of silver ore of a rich quality, worth \$50 and over to the ton, others report that they have very little ore and could not run the mill a week, and that it will take another year with all the hands that can be worked

to advantage to fully develop the mine or mines of the company sufficient to keep the mill running. This is a very important question, and everybody hopes the production of ore will be good and the mill will soon be started up and kept running.

DEADWOOD BASIN.—*Boise Statesman*, Sept. 29: Major Downs returned from Deadwood basin Thursday. He says he brought down 110 ounces of gold dust worth \$1550 per ounce. It took seven men 21 days to work the ground, and at \$3 per day and board, the cleanup left a very small margin to divide with the owners. They may find a better streak and still make money out of the investment. The major says that Al Karston has sold out his quartz claim in Deadwood for \$2300 cash.

DISCOVERY.—*Boise Statesman*, Sept. 29: There is some prospecting going on about ten miles from this city and two leads have been discovered near the summit east of the Idaho road, one owned by K. P. Mowman, and another by John Earley, that are very likely to make a boom for Boise City. One nine-four miles from here shows up better than Gold Hill or any of the other gold mines in Boise or Owyhee counties with the same development work.

MONTANA.

MONITOR TUNNEL.—*Butte Miner*, Sept. 25: The length of the Monitor tunnel so far as completed is 375 feet, and the face is in granite of a soft formation. The company a few days ago encountered in the ground of J. Crossman & Co. a ledge eight feet in thickness and of a very promising character. Samples taken from the ore body average 8 per cent in copper and 9 ounces in silver. The ground in which this strike was made is called the New Emerald and is the most promising of any of its kind struck in that vicinity for many a day, owing chiefly to its depth of 150 feet from the surface. Messrs. Crossman & Co. have the right to use the tunnel to convey their ore from their different ledges along the tunnel by allowing the tunnel company to run through their ground. The tunnel company will have to run 600 feet further before they come into their own ground. All hands were laid off at the Mountain Consolidated yesterday on account of the ore bins being completely full. The erection of the new gallowes frame has just commenced, also the laying of the new engine-bed. The new shafthouse, a large and commodious structure, has been completed. Stopping and drifting is being carried on extensively all over the mine. The Silver Bow mill is putting through 40 tons of ore from the Stevens and Belle of Butte, and also working considerable custom ore. The owners have placed in position what is called the Yates pulverizer, for the purpose of crushing ore. The Pacific is daily producing 40 tons of ore which is reduced at the Butte Reduction Works. It is said that over \$240,000 has been produced from the mine from the time the Parrot Co. threw up its bond on it for that amount. Mr. Brant of the Parrot mine has set in position and in full working order a peculiar but complete set of saws for the purpose of framing square sets at the Bluebird mine. This work has hitherto been done by hand, and the new process is a great saving to the three companies using it—the Bluebird, Mountain View and Parrot. The Wake-Up Jim and Green Mountain are to be connected by a crosscut that is at present being run for that purpose. The Parrot mine was idle yesterday, the chutes being full of ore both at the mine and smelter. Considerable prospecting is being done in the lowlands, but none on a large scale.

MADISON MINES.—*Cor. Inter-Mountain*, Sept. 27: Yesterday I visited one of the most promising gold prospects it has ever been my fortune to cast an eye on. This claim is called the Bill Fairweather lode and was located a week ago by James M. Bradley and Thomas Branham, and lies on the divide of the south fork of Mill creek and the south fork of Meadow creek. The ore body is at least three and one-half feet wide, and at a low estimate will mill \$100 per ton for that width, while I think that \$200 per ton would not be overestimating it. The ore is a telluride-appearing ore; nearly all of it shows large quantities of free gold in nuggets and wire of a high grade. Considering its size, I think it the richest and most valuable gold-quartz discovery ever made west of the Missouri. Should the ore hold out for 100 feet deep in size and richness, its value would be something enormous.

THE CURLEW.—*Mining Review*, Sept. 20: In the above-named mining property recent results obtained are proving its worth to a degree that cannot be otherwise than most encouraging to those who have at heart the mineral interests of Missoula county, wherein the mine is located, as well as being a source of pride and revenue to its owners, among whom may be mentioned the veteran mining man, A. M. Holter of Helena, as being most largely interested. It is learned that a site for the location of a smelter has been surveyed near the east end of the Curlew claim, the capacity of which will be not less than 50 tons per day. Several thousand tons of low-grade ore are now on the dump awaiting operations of the smelter before being converted into bullion. A great deal of high-grade ore finds regular shipment to the smelter at Wickes, with a result that assures the success of the mine. The new works will be in close proximity to the pretty little town of Victor, to which they will doubtless be a most valuable acquisition.

NEW MEXICO.

MILL.—*Lordsburg Liberal*, Sept. 29: Col. Morrow expects to have the Hercules mill pounding ore in a few days. He will begin with some of the ore on the Atwood dump. Jeff Whittington has bought his partner's—Adam's—interest in the Comstock group. Baxter & Whittington now own the entire group. O. R. Smyth has put a couple of teams to hauling concentrates from Carlisle to Duncan. He has not taken the contract to do all of the hauling, as has been stated, and the company teams will still be kept at work.

DEVELOPMENT WORK.—*Silver City Enterprise*, Sept. 29: The new hoist just completed by the Aztec company works like a charm. The Golden Giant at Pinos Altos is rapidly coming to the front. John T. Mitchell has superseded Captain Webb at Telegraph. Four or five additional miners will be put to work immediately. A new engine and skip have been ordered by the owners of the Golden Giant mine. T. N. Childers and Paul Curtis have leased the Unlimited Coinage mine near Bear mountain to

Atkinson Bros., who intend during the next six months, which time their lease runs, to do considerable work on it. The Golden Crown mine at Pinos Altos, owned by Joe Williams, Ed Baker and Andy Laid, is coming to the front. They have over 200 tons out ready for the mill. Frank Carter, president, and J. C. Howe, director of the Deep Down, departed for St. Louis Tuesday, after having spent several days at the mine, very much pleased with the outlook. On Saturday last 30 men were let out from the Mountain Key mine, the force being reduced from 60 to 30. The reduced force is sufficiently large enough to break all the ore that the Key mill can handle with its limited water supply at present.

WELL.—*Southwest Sentinel*, Sept. 26: The work on the well which is being sunk for water for the 10-stamp mill has been temporarily discontinued, owing to the large flow of water encountered at 14 feet. Negotiations are now on foot to secure the use of the Atchison, Topeka & Santa Fe R. R. Co.'s pump, with which to remove the water, so that the well can be sunk to bedrock. The railroad company telegraphed that it would lend the use of the pump; it will be set to work in a few days.

GROGETOWN.—The Scottish mine was sold last Tuesday by Special Master Harlee to George O. Smith for \$10,000. The sale has been confirmed by Judge Henderson.

BALD MOUNTAIN.—A strike has been made at Bald Mountain in the Silver King. At the bottom of the shaft, 120 feet, a large body of ore has been exposed running the whole width of the shaft; it will run in the neighborhood of 500 or more to the ton in gold and silver. At the depth of 62 feet a crosscut has been run a distance of 52 feet through ore. No side-wall has yet been reached.

OREGON.

THE MONUMENTAL.—*Bedrock Democrat*, Sept. 26: The *Democrat* reporter met Mr. J. B. Bowick, one of the representatives of the English syndicate who recently purchased the Monumental mining property in Granite district, and learns from that gentleman, who is just down from the mine, that work has been commenced in dead earnest, and already a force of about 30 laborers are employed there. The mine and mill have lain idle for the past ten years. In consequence of this the tunnels in many places have caved in by the rotting of the timbers and the mill is out of order in many ways. The company taking charge of the property have been compelled to start anew and retimber the mine and overhaul the mill.

BAKER COUNTY MINES.—*Cor. Bedrock Democrat*, Sept. 26: Things are quiet here at the Eureka and Excelsior. Everybody is waiting to see what will come next. Fruit creek rather has the "call" on us now. The Columbia presents a growing activity, warranted by the ore showings being made, and it would not surprise yours truly to see a formidable rival to Cracker City spring up in that gulch. Work on the Buckeye is going on slowly, but with good results, the owners having recently struck some \$300 ore in one of their cuts. The Buckeye is west of and on the parallel ledge to the Columbia. Little or nothing, save assessment work, is being done on the south extensions. On the North Pole the usual development work is going forward, with indications of continuous and vigorous work for the winter. The Ten Strike, above the North Pole and on the same vein, is under bond to the E. & E. Co., and is being worked with vigor. In the cove some development is going on in the Imperial, where a good showing is being made; likewise in the Gray Eagle, where a four-foot breast of high-grade ore has been shown up in the face of the tunnel. At the Monumental, recently sold to an English company, we understand Chinese miners only are being employed. The same is also said to be true of the Cabell Bros' mine. Quite a number of miners have gone over to those two mines during the past week, seeking employment, only to return with the same story—no white men need apply.

UTAH.

REVIEW.—*Salt Lake Tribune*, Sept. 29: The past week has been a quiet but active one in mining circles. The movements of ores and bullion have been heavy. The receipts of the metals in this city for the week ending September 26th, inclusive, were to the value in all of \$184,705.36, of which \$101,368.85 was bullion and \$83,337.51 was ore. For the previous week the receipts were of the value of \$149,394.12, of which \$82,004.96 was ore and \$67,389.16 was bullion. The Ontario output for the week was 58 bars of bullion, 32,948.03 fine ounces; ore sales, \$24,033.47, an approximate total of \$56,981.50. The Daly product for the week was 26 bars of bullion, 23,507.29 ounces; no ore sales. The Horn Silver miners apparently dormant. Fine bar receipts in this city for the week were to the value of \$40,966.81; base bullion, \$30,142.10. The product of the Hanauer smelter for the week was \$14,150 in bullion; of the Germania, \$16,008.94. Ore receipts in this city for the week were \$44,907.52 by Wells, Fargo & Co.; \$18,200 by McCormick & Co., including \$4950 Crescent and \$2000 Queen of the Hills; and \$20,230.99 by T. R. Jones & Co.

EUREKA, TINTIC DISTRICT.—The camp is prosperous. There is no difficulty existing between the "bosses" and the men. The wages are from \$2.50 to \$4 per day to the laborers and miners. All appear to be well satisfied. The population will number 1500 souls, and there is not, strictly speaking, an idle man in the camp. Particularly is this so of those who do not allow alcoholic influences to get away with their better judgment. In fact, this is a wonderful camp. The future of this section of the Territory is assured. Captain Day, who has so long had charge of a portion of the destinies of Eureka, has gone to California, and Hank Smith, the old Comstocker, has assumed complete control of the Beck and Bullion mine.

NEW EMMA.—*Salt Lake Tribune*, Sept. 30: The New Emma mine, Alta, will start its concentrator to work next Tuesday, after having been idle for quite a while. They have large quantities of concentrating ore in the old workings, and expect to keep the mill running until winter closes around them. Work will be resumed in the depth under the tunnel ere long. The ground there is looking well, and operations were suspended only because of the large quantity of water last spring. Friends of the mine speak very hopefully of its future.

JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 FREMONT STREET, SAN FRANCISCO, CAL.

"HENDY" IMPROVED "CHALLENGE" ORE FEEDER.

The best form of Feeder ever devised, and pronounced by reputable mining men to be far superior to any form of "Roller" Feeder manufactured. We refer to the following gentlemen who have furnished us with testimonial letters to the above effect, which can be seen at our office, viz.:

N. W. CROCKER, Supt. Bunker Hill Gold Mining Co., Amador City, Cal. D. C. WICKHAM, Taylor Mine, Greenwood, Cal.
J. R. TREGLOAN, Supt. South Spring Hill Gold Mining Co., Amador City, Cal.
W. G. ROBERTS, Greenwood, El Dorado Co., Cal.

WE ARE MANUFACTURERS OF THE

"CHALLENGE," "STANFORD," "TULLOCK," & "ROLLER" FEEDERS,

And will furnish descriptive Catalogues and quote prices upon application.

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; is in successful operation and we guarantee its work as represented.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

FRISBEE-LUCOP MILL COMPANY,

GIDEON FRISBEE, Manager, - - - 461 Howard St., San Francisco.

HOOKER & LAWRENCE, Gen'l Ag'ts, 145 Broadway, New York.

L. C. MARSHUTZ

T. G. CANTRELL.

NATIONAL IRON WORKS

N. W. Corner Main and Howard Sts., San Francisco,

—MANUFACTURERS OF—

Stationary and Compound Engines, Flour, Sugar, Saw and Quartz Mill Machinery.

AMALGAMATING MACHINES. CASTINGS AND FORGINGS Of Every Description

ALL WORK TESTED AND GUARANTEED.

IMPROVED PORTABLE HOISTING ENGINES.

NATIONAL ROCKER QUARTZ MILL.

KENDALL'S PATENT, AUGUST 24, 1886.

CAPACITY, 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.

Send for Circulars and Price List.

MARSHUTZ & CANTRELL.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on elcos and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

WANTED.

To Buy or Lease Graphite Mine or Location. Address: PASADENA MINING & DEVELOPING CO., PASADENA, CAL.

CIVIL ENGINEER, and SANITARY ENGINEER, H. J. JACKSON, 121 Montgomery St., S. F.

WINANS'

ANTI-INCORUSTATION POWDER Or Boiler Compound

For Removing or Preventing Scale, Corrosion and Pitting in Steam Boilers. Send for references. Also, FERRIS RUBBER Mfg Co. Plumbago Sheet, and Piston and Valve Rod Packing, to be had only of J. C. WINANS, 220 Fremont St., S. F., Cal.

HOISTING ENGINES FOR MINES.

1, 2, or 4 Drums, with Reversible Link Motion or Pat. Improved Friction.

MADE ONLY BY THE

LIDGERWOOD M'F'G COMPANY,

96 Liberty St., New York.

PACIFIC COAST AGENTS, PARKE, LACY & CO., San Francisco.

THE ROLLER ORE FEEDER

[Patented May 28, 1882.]

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required. In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

Golden State and Miners' Iron Works,

Sole Manufacturers,

527 First Street, San Francisco, Cal.

STEARNS M'F'G CO.,

29 & 31 Spear St., San Francisco, Cal.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

MARKET REPORTS.

Local Market.

SAN FRANCISCO, Oct. 4, 1888.
SILVER—The past week the London and New York markets have gained in strength, with steady advances reported. Various causes are assigned for the rise, the main one being that Russia has negotiated a small loan and the capitalists who have subscribed to it are buying silver to make the payments. Others, again, think it is due to the large purchases of wheat in both India and Russia and the demand for silver to remit in payment. As India's wheat exports will not aggregate as much as last year's, and Russia's only a little more, this theory is hardly acceptable. There are others again who claim that large capitalists directly interested in advancing and in keeping up the market value of silver have either formed or are forming a syndicate looking to the control of the leading silver markets. The out of silver last year is estimated as follows: United States, \$58,000,000; Australia, \$24,000,000; Mexico, \$26,000,000; Russia-Siberia, \$22,000,000; Central and South America, \$15,000,000. Total, \$145,000,000.

In our market holders appear to be unsettled in their views, although at the close they ask 94@94 1/4. The last reported sale was at 94c, bought for shipment to Calcutta. The shipments of silver bars for the month of September by sea from this port were as follows: Hong Kong, \$703,000; Bombay, \$16,700; Japan, \$157,000; Calcutta, \$60,000. For the first nine months of this year the shipments by sea from this port of silver bars aggregated \$7,617,900 against \$6,058,915 for the like time in 1887. Of the shipments so far in this year, Bombay took \$2,620,690 against \$504,790 in 1887; Calcutta, \$294,000 against \$65,250 in 1887; Hong Kong, \$6,046,373 against \$5,801,655 in 1887, and Japan, \$1,459,106 against \$2,218,975 in 1887.

LEAD—There is a good demand for pig, with prices well maintained at this season of the year; the consumption is quite large for the making of shot. By reference to the daily closings in the New York market it will be seen that prices have fluctuated considerably.

TIN—Pig tin in our market is reported dull but firmly held, owing to the high markets abroad. Buyers do not anticipate their wants, only buying in a hand-to-mouth way. Tin plate is also dull. To arrive, large consumers are slow in contracting, unless offered inducements.

BORAX—The market is reported to be in a strong position, owing to the active market at the East, with prices reported to be tending up.

ANTIMONY—The market is very strong at the last reported advance.

PIG IRON—The market continues to hold to strong prices, owing to receipts going into consumption as fast as received, and also to the higher and strong markets abroad.

QUICKSILVER—The market is reported steady at the decline. The home demand is reported to be increasing, but no great enlargement in the volume of quicksilver going out is looked for in this month.

COAL—The imports into this port last month aggregated 143,706 tons against 83,626 tons in the like month in 1887. From January 1st to September 30th this year, the imports aggregate 1,000,652 tons against 636,662 tons for the like time in 1887. The imports into San Diego and San Pedro are reported to have been correspondingly heavy. Although the imports are largely in excess of last year, yet importers are bulling the market up, owing to a strike in the principal Newcastle coal mines. They went on August 25th, and the only vessels which have since sailed from Newcastle for this port are the Celtic Chief and Patterdale on the 29th August, both of which had completed their cargoes before the strike. During the four weeks ending Sept. 5th, the coal departures from Australia to California embraced 10 vessels for San Francisco, 4 for San Diego and 1 for Wilmington, leaving 15 in port to follow, including 10 for San Francisco, 1 for Wilmington and 4 for San Diego. One of those for San Diego has since had her charter canceled. There are now supposed to be 25 vessels on the way from Australia to California and 45 entered out, as follows:

	En route.	Entered out.
For San Francisco.....	15	26
For Wilmington.....	3	7
For San Diego.....	7	12

Eastern Metal Market.

New York, Oct. 3, 1888.—The following are the closing prices the past week:
Silver.....\$87 60
Copper.....\$5 05
Tin.....\$23 75
Thursday.....\$87 60
Friday.....\$87 60
Saturday.....\$87 60
Monday.....\$87 60
Tuesday.....\$87 60
Wednesday.....\$87 60
The market closed as follows: Lake copper is nominal at \$17 1/2 in open market, but it is said that consumers are supplied at \$18 1/2. Pig lead is quoted at \$5 05 for this and next month, with more activity reported. Quicksilver is weaker; 63c is the extreme figure. No California is offering. Borax is very active. All other purchases made in the West will be wanted, and may possibly advance 1c on the late prices. Tin closed easier.

The following is the latest from the "New York Metal Exchange Market Report":

TIN—Sales of only 10 tons have been recorded, although there has been quite enough variation in values to attract scalping. The extreme range covers about 40 points, with closing figures for spot about the same as they opened, or a quarter cent higher than last Saturday; white future, which have been more irregular, make a net gain of 60@75 points. Closes firm and fairly active at \$23.80.

COPPER—Less complete apathy has prevailed than in previous weeks, but the market is still very dull, although quite firm and advancing nearly a quarter cent on the week, with total sales of 100,000 pounds. Closes at \$17.40.

LEAD—The aggregate sales reach 1800 tons, but 1350 tons of this was done on Monday; since when the market has been quiet, holding steady to firm throughout, with almost no change in price. Closes at \$4.97 1/2, against \$4.27 1/2 at same date in 1887.

SILVER—Remains flat, dull and unprofitable in the

way of commissions; but has gained 15 points during the week.

Prices generally ruling for metals not regularly dealt in on Call at the N. Y. Exchange, covering extremes of buyers' and sellers' views. All prompt delivery. Australian Tin, @—@—; Biliton Tin, @—@—; Banca Tin, @—@—; Baltimore Copper, \$16.65@—; Orford Copper, \$16.00@25; P. S. C. Copper, @—@—; Foreign Lead, \$5.00@5.25; Foreign Spelter, \$5.40@5.60; Antimony, \$9.75@13.50.

The Philadelphia market is reported as follows by the New York Metal Exchange Report:

PIG IRON—The general improvement which has been noted during the past two weeks continues, although at the moment of sales are light, but prices are firm as quoted herewith.

MANUFACTURED IRON—Prices are firm, particularly in bars and skelp iron, but plates are somewhat irregular. A circular recently issued by a large firm in Pittsburgh offering to accept orders for spot steel plates at same figures as may be quoted for iron, has caused an uneasy feeling, as it is impossible to decide how low might be quoted by mills desiring an order. It looks threatening, although some well informed parties attach very little importance to offers of this kind.

STEEL RAILS—The market continues quiet. Prices are nominally \$9 at mill, but this would be shaded on a large-sized order.

OLD RAILS—No transactions of any size to report. Held in lots in store are standing off, but a firm offer would evidently result in business.

SCRAP IRON—In fair demand at quoted rates.

San Francisco Metal Market.

Mining Share Market.

It seems somewhat strange that while mining matters on the Comstock are so active the mining share market here should show so little life. The fluctuations in prices only cover a few cents each way, and there is very little interest in the transactions one way or the other. On the Comstock, according to the Enterprise, the preparations for the resumption of active milling and mining operations along the lode have been thorough and are nearly complete. It is predicted that mors ore will be got out and milled during the coming season than was ever before milled on the lode, with possibly the single exception of a year or two during the bonanza days.

The directors of the Sutro Tunnel Company announce that stockholders have an opportunity, for 90 days from October 1st, to subscribe for the new first-mortgage bonds, which run for 30 years and bear four per cent interest. The proceeds are expected to pay all indebtedness. According to the statement published, the receipts last year exceeded the disbursements by \$172,890, and as the interest on the bonds amounts at the maximum to but \$88,000, there should be a fair dividend remaining.

Mining Bureau Contributions.

The following are among the recent additions to the museum of the California State Mining Bureau:
Cinnabar from the first mine worked for quicksilver on the continent, Santa Rosa, Mexico, from J. W. C. Maxwell.
Livingstonite, Huitzuco, Mexico, J. W. C. Maxwell.
Copper and silver ores from Kootsnai, assaying from \$60 to \$1800 per ton, R. D. Atkins.
Malachite, large and fine specimens, Copper Queen mine, Bisbee, A. T., Lewis Williams.
Bliss on pine tree, cut by Kit Carson, with his name and date, 1844, from head of Carson Canyon, Alpine Co., Cal.; Wm. Thornburg and J. F. O'Gorman.
Building stone from Los Angeles, Brownstone and Granite Co.
Building stone, Coronado Island, Hanbury & Garvey.
Gold quartz rich in free gold, Last Chance mine, Monterey county, W. D. Cruikshank.
Bismuthinite, Sinaloa, Mexico, Gus Peterson.
Crab of enormous size, Japan, O. Keil.
Spears, South Sea Islands, Dr. Lane.
Limestone and lime made from it, Tehachapi, Kern Co., Mrs. D. B. Rogers.
Marble, Douglas Co., Oregon, C. Fletcher.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:
Bluebird, Sept. 24, \$23,200; Moulton, 25, \$10,320; Mt. Diablo, 26, \$16,000; Hsnauer, 25, \$1750; Germania, 25, \$11,085; Hsnauer, 26, \$1700; Queen of the Hills, 26, \$2000; Crescent, 26, \$4950; Hsnauer, 27, \$1800; Germania, 23, \$4923; Hsnauer, 23, \$3400; Hsnauer, 23, \$3700; Germania, 30, \$3683; Hsnauer, 30, \$1900.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in Dewey & Co.'s Patent Office Library, 220 Market St., S. F.

- FOR WEEK ENDING SEPTEMBER 25, 1888.
389,870.—REGISTERING METER FOR ELECTRIC CURRENTS.—J. D. Bishop, S. F.
390,921.—DUSTPAN.—G. A. W. Cage, Jr., Los Angeles, Cal.
390,162.—CORSET.—Elizabeth Glass, S. F.
389,884.—THRASHER.—Grattan & Shippee, Stockton, Cal.
390,129.—AIR-FEEDER.—C. A. Klotz, Vallejo, Cal.
390,130.—DOOR SECURER.—A. J. Longenecker, Elk Grove, Cal.
390,135.—FRUIT-BOX.—R. E. Morey, S. F.
389,979.—WALL PROTECTOR.—Robbins & Broad, S. F.
389,906.—PROVISION SAFE.—T. G. Rounds, Riverside, Cal.
390,038.—SAFETY TIP FOR PENCILS.—J. M. Schofield, Merced, Cal.
389,984.—STOVEPIPE HOLDER.—A. J. Spicer, Portland, Ogn.
390,044.—ROTARY ENGINE.—F. L. Voorhies, San Jose, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast at inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

FRUIT BOX.—R. E. Morey, S. F. No. 390,135. Dated Sept. 25, 1888. This box is formed of an exterior frame having a central partition, the top of which is arched. The cover is sufficiently flexible to allow it when slid in under the side guides to be bent up by the arched central partition, thus causing it to hand in places. The body of the box is formed of veneer strips bent and secured to the frame. The boxes thus made are strong and can be piled up on one another without injury. It differs from the ordinary berry-box in being complete in itself, whereas the veneer berry-boxes are usually packed in independent crates.

SAFETY-TIP FOR PENCILS.—James M. Schofield, Merced, Cal. No. 390,038. Dated Sept. 25, 1888. This safety-tip consists of a piece of rubber, to be applied to the pencil directly, or to the usual metal cylinder of a pencil in the usual manner, and to serve as an eraser, the rubber being provided or formed with prongs of the same material. The object is to hold the pencil in the pocket by reason of the prongs catching in the material of the pocket. On account of the yielding character of the prongs they will not appreciably resist a positive effort to withdraw the pencil, but they will prevent it from dropping out. Nor will they injure the clothing nor affect the function of this tip as an eraser.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rates, \$3.00 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Sampling Works for Sale.

The works are situated on A. & P. R. R., Calico Mining District, Daggett, Cal., and contain a first-class Engine and Boiler with Ore Crusher and other machinery, Platform Scales, Mill Scales, Assaying Outfit, etc., all nearly new. Also upon the premises an office building and a comfortable dwelling house (portable). The above can be had at a bargain. Apply to GILLESPIE & CHILDS, 123 California street, San Francisco.

ASTRONOMICAL TELESCOPE for sale cheap. Ten-inch glass, very fine. Equatorial mount. F. M. B., 257 S. Market, Springfield, Ohio.

ASSESSMENT NOTICE.

Gray Eagle Mining Company.—Location of principal place of business, San Francisco, California. Location of works, Placer County, Cal.

NOTICE is hereby given, that at a meeting of the Board of Directors, held on the 4th day of September, 1888, an Assessment (No. 9) of Five Cents per share was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin, to the Secretary, at the office of the Company, 327 Pine street, rooms 9 and 10, San Francisco, California. Any stock upon which this assessment shall remain unpaid on the 10th day of October, 1888, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Tuesday, the 30th day of October, 1888, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors.

O. H. BOGART, Secretary.
Office—327 Pine St., Rooms 9 and 10, S. F. Stock Exchange Building, San Francisco, Cal.

ASSESSMENT NOTICE.

Lord of Lorn Gold and Silver Mining Company. Location of principal place of business, City and County of San Francisco, California. Location of works, Gold Hill Mining District, State of Nevada.

NOTICE is hereby given, that at a meeting of the Board of Directors of the above-named corporation, held on the 6th day of September, 1888, an assessment (No. 4) of Ten Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, Nos. 13 and 15 Fremont street, San Francisco, California. Any stock upon which this assessment shall remain unpaid on the 12th day of October, 1888, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on Friday, the second day of November, 1888, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

R. N. VAN BRUNT, Secretary.
Office 13 and 15 Fremont St., San Francisco, Cal.

GOLD & SILVER MINE

Now Under Development.

Together with many additional claims. Shaft down (in ore) 120 feet. One carload already shipped, \$1750. Capital wanted to further develop, rapidly. To those meaning business, good terms will be offered. Mines 8 miles from railroad. Address,

J. B. BAINBRIDGE,
Box 360. Pasadena, Cal.

GOLD PROSPECT WANTED.

We desire to purchase a moderately well developed Gold Prospect, in California, having a ledge of 3 feet and upward of free milling ore of \$10 and upward per ton, at a fair price.

I. H. MAYER & CO.,
411 California St., San Francisco.

Books on Working Ores.

By GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1880.

This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, \$3, coin, postage free. Sold by Dewey & Co., Publishers, 252 Market St., San Francisco, Cal.

By C. H. AARON.

AARON'S MACHINE GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, \$3. Sold by Dewey & Co., S. F.

ESTABLISHED 1863.

Patent Agency.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us offer to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St. S. F.

We are prepared to give estimates for Hoisting Works and Pumping Plants, Stamp Mills, Smelters and Concentrators.

IMPROVED FORM OF HYDRAULIC GIANTS.

THE ABOVE CUT ILLUSTRATES THE IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS which we manufacture. We guarantee purchasers of this form of Giants against all costs, expenses or damages which may arise from any adverse suits or actions at law. We are further prepared to furnish Single-Jointed Giants when required. Prices, discounts and Catalogues of our specialties of Hydraulic Mining Machinery sent on application.

JOSHUA HENDY MACHINE WORKS, 39 to 51 Fremont St., San Francisco.

HOSKIN'S

IMPROVED

ONE-JOINTED

HYDRAULIC MACHINE.

The statement of Mr Joshua Hendy that ANY STYLE of machine is an infringement on any style manufactured by him, he knows to be absolutely false. The Supreme Court of the United States on March 19th decided that the pretended patent for infringing, which he has for years been fleeing miners for royalty, is ABSOLUTELY VOID, with costs of suit to Hendy & Fisher. I am the inventor of all styles in use, and am prepared to fill orders to suit customers. Send for list of prices of Hydraulic Machinery. R. HOSKIN, Empire Foundry, Marysville, Cal.

GREAT REDUCTION!

BATTERY SCREENS.

Best and Cheapest in America.

No imitation, no deception, no planished or rotten
iron used. Only genuine Russia iron in Quartz Screens.
Planished iron screens at nearly half my former rates.

I have a large supply of Battery Screens on hand
suitable for the Huntington and all Stamp Mills, which I
will sell at 20 per cent discount.

PERFORATED SHEET METAL

For Flour and Rice Mills, Grain Separators, Revolving
and Shot Screens, Stamp Batteries and all kinds of Min-
ing and Milling Machinery. Iron, Steel, Copper, Brass,
Zinc and other metals punched for all uses.

Inventor and Manufacturer of the celebrated Slot-Cut
hurred and Slot Punched Screens.
Mining Screens a specialty, from No. 1 to 15 (fine).

Orders promptly attended to.

San Francisco Pioneer Screen Works,
21 & 223 First St., San Francisco, Cal.
JOHN W. QUICK, Proprietor.

THE PELTON WATER WHEEL

Gives the highest efficiency of any Wheel in the world
and is everywhere recognized as the standard for high
pressure service.

UPWARDS OF 500 IN USE.

From 12 to 20 per cent better results guaranteed than
can be produced from any other Wheel in the country.
It is not only most economical of water, but the most
simple and reliable power for Quartz Mills, Hoistings,
Pumping, or any other purpose where water power can
be used.

ELECTRICAL TRANSMISSION.

Power from these Wheels can be transmitted by elec-
tricity several miles with small loss, and made available
for running Mills, Pumping and Hoisting Works, Trun-
cars, etc. Address

The Pelton Water Wheel Co.,
127 FIRST ST., SAN FRANCISCO, CAL.

Practical Treatise on Hydraulic Mining.
By AUG. J. BOWIE, JR.

This new and important hook is on the use and con-
struction of Ditches, Flumes, Dams, Pipes, Flow of Water
on Heavy Grades, methods of mining shallow and deep
placers, history and development of mines, records of
gold washing, mechanical appliances, such as nozzles,
hurdy-gurdies, rockers, undercurrents, etc.; also describes
methods of blasting; tunnels and sluices; tailings and
dump; duty of miners' inch, etc. A very practical work
for gold miners and users of water. Price, \$5, post-paid.
For sale by Dawer & Co., Publishers, 252 Market St., San
Francisco.

San Francisco Cordage Factory.
Established 1856.

Constantly on hand a full assortment of Manila Rope
Sisa Rope, Tarred Manila Rope, Hay Rope, Whale
Line, etc., etc.
Extra sizes and lengths made to order on short notice
TUBBS & CO.

.....MANUFACTURERS OF.....

Cast Steel Castings and Steel Forgings

UP TO 20,000 LBS. WEIGHT.

True to pattern and superior in strength, toughness and durability to Cast or Wrought
Iron in any position or for any service.

GEARINGS, SHOES, DIES, CAMS, TAPPETS, PISTON-HEADS, RAILROAD and MA-
CHINERY CASTINGS of Every Description.

—ALSO—

HOMOGENEOUS STEEL, SOFT and DUCTILE,
SUPERIOR TO IRON FOR
LOCOMOTIVE AND MARINE FORGINGS.

ALSO Steel Rods, from 1 to 3 inch diameter and Flats from 1 to 8 inch. Angles, Tees, Channels and other shape
Steel Wagon, Buggy, and Truck Tires, Plow Steel; Machinery and Special Shape Steel to size and length
STEEL RAILS from 12 to 45 pounds per yard ALSO, Railroad and Merchant Iron, Rolled
Beams, Angle, Channel, and T iron, Bridge and Machine Bolts, Lag Screws, Nuts, Washers, Ship and Boat
Spikes, Steamboat Shafts, Cranks, Pistons, Connecting Rods, etc. Car and Locomotive Axles and Frames,
and Iron Forgings of all kinds, Iron and Steel Bridge and Roof Work a Specialty.

HIGHEST PRICE PAID FOR SCRAP IRON AND STEEL.

Orders will have prompt attention. Send for Catalogues. Address

PACIFIC ROLLING MILL CO., 202 Market St., San Francisco.

FULTON IRON WORKS,

HINCKLEY, SPIERS & HAYES, Proprietors.

[ESTABLISHED IN 1855.]

Office, 213 Fremont St.,

San Francisco.

—MANUFACTURERS OF—

TUSTIN'S PULVERIZER.

MARINE ENGINES AND BOILERS.—
Propeller Engines, either High Pressure or Compound,
Stern or Side-wheel Engines.

MINING MACHINERY.—Hoisting Engines and
Works, Cages, Ore Buckets, Ore Cars, Pumping Engines
and Pumps, Water Buckets, Pump Columns, Air Com-
pressors, Air Receivers, Air Pipes.

MILL MACHINERY.—Batteries for Dry or Wet
Crushing, Amalgamating Pans, Settlers, Furnaces, Re-
torts, Concentrators, Ore Feeders, Rock Breakers, Fur-
naces for Reducing Ores, Water Jackets, etc.

MISCELLANEOUS MACHINERY.—Flour
Mill Machinery, Saw Mill Engines and Boilers, Dredging
Machinery, Powder Mill Machinery, Water Wheels.

Tustin's Pulverizer
WORKS ORE WET OR DRY.

ENGINES AND BOILERS

OF ALL KINDS,

Either for use on Steamboats or for use on Land.

Water Pipe, Pump or Air Columns, Fish
Tanks for Salmon Canneries

OF EVERY DESCRIPTION.

Boiler Repairs Promptly attended to and at very moderate rates.

AGENTS FOR THE PACIFIC COAST FOR THE

Deane Steam Pump.

SPECIALTIES:

Corliss Engines and Tustin Ore Pulverizers.

Agents and Manufacturers of the Llewellyn Feed Water Purifier and Heater.

DEANE STEAM PUMP.

THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

GIANT POWDER or DYNAMITE,

Of Different Strengths as Required.

NOBEL'S EXPLOSIVE GELATINE," which contains 94 per cent of Nitro-Glycerine, and
GELATINE-DYNAMITE, Stronger than Dynamite and even Safer in Handling.

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blast-
ing Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and
saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

BANDMANN, NIELSEN & CO.

CAPS and FUSE for Sale

GENERAL AGENTS, SAN FRANCISCO CAL.

QUARTZ SCREENS

A specialty. Round, slot
or barred slot holes. Gen-
uine Russia Iron, Homo-
geneous Steel, Cast Steel or
American planished Iron.

Zinc, Copper or Brass Screens for all purposes. Cali-

er, 50 cents additional per volume.

ATTENTION, GOLD MINERS!

WE ARE SELLING

Silver-Plated Amalgamating Plates

For Saving Gold in QUARTZ, GRAVEL and PLACER MINING,
At reduced rates. Get our prices. Three thousand riders filled. Fifteen medals awarded. Our plates have proved the best, and far superior to others in weight of silver and durability. Old mining plates replated. These plates can also be purchased of JOHN TAYLOR & CO., cor. First and Mission Sts.

SAN FRANCISCO GOLD, SILVER and NICKEL PLATING WORKS,
K. G. DENNISTON, Proprietor. 653 & 655 Mission St., San Francisco, Cal.

NOTICE.—Our Silver Plated Plates have always proved as represented. We have been manufacturing them for 20 years, and use only the best Lake Superior Copper and Refined Silver. Comparing our plates with those of other manufacturers, after repeated tests, we can safely guarantee much better plates for the same money. Our plates are used by all the prominent mining men on the Pacific Coast. SEND FOR CIRCULAR.

ORE CRUSHER

THE DOUBLE "ECONOMIC" STAMP MILL.

We have here the Stamp Mill in a cheap and simple form. The high drop of the old stamp is more than compensated for by the great weight (1200 lbs. each) of our stamps, and the rapidity (300 strokes each per minute) with which they run. There are 4 shoes in each stamp, so that there are 4800 strokes of the shoes on the dies per minute. Less power is required than in any other mill to do the same amount of work.

The Mortar has screens at both ends, giving ample discharge. There are no cams or tappets to wear or be adjusted. The stamps adjust themselves as the shoes wear.

AN AUTOMATIC ORE FEEDER

Goes with each Mill. We also have a snitable

Rock Breaker.

Several Mills are now in the mines doing excellent work. The "Economic" is not only a mill for small mines, but we believe it is destined to SUPERSEDE THE OLD STAMP IN MILLS OF THE LARGEST CAPACITY.

TATUM & BOWEN,

Quicksilver Flasks.

At the New Almaden quicksilver mines, in this State, the product from the several furnaces (after passing through the condensers) is received in kettles, the product of each furnace being kept separate. From the kettle the quicksilver is ladled by a scoop, weighed and placed in flasks. We give on this page a view made from a photograph taken at New Almaden

the tariff. Foreign quicksilver pays a duty of 10 per cent, the flasks in which it comes being admitted duty free. American-made flasks shipped abroad and returned empty have to pay a duty of 45 per cent.

When the stoppers are unscrewed and contents of the flask discharged, the flasks can be used again, and the Quicksilver Company is prepared to pay a good price for all it can get. If, however, holes are drilled in the flasks, they

Mining-Law Suggestions.

There is a growing feeling in the mining communities that the present laws relative to the acquisition of titles to mineral property should be so simplified and amended as to enable citizens to obtain title to quartz and placer claims by simple application in the district land office, limiting the amount to a certain number of acres, be it 20 or 40. All such lands, situated

in the present case, is the following: This is to suspend indefinitely the time for final proof of homestead and pre-emption settlers upon mineral ground, leaving the miner free to prospect and develop the mineral resources that the land may contain, while the common law would hold him responsible for any damage he might do the farmer's improvements. This would, in reality, be of great benefit to all such settlers as are engaged in legitimate farming, for pros-

Photo-facsimile.

WEIGHING QUICKSILVER AND FILLING FLASKS, NEW ALMADEN MINE.

by Mr. Bulmore, showing the process of weighing the quicksilver and filling the flasks. The stoppers are firmly screwed into the flasks by means of a long lever, one man working at each end of this.

Many people have no doubt wondered why quicksilver flasks should always contain 76.50 pounds instead of some even number of pounds. The reason of this is that the original Spanish flask or hottles contained 75 Spanish pounds, which equal 76.03 pounds avoirdupois.

The average weight of quicksilver flask is 13½ pounds. The flasks used were originally imported from England, and cost, duty paid, \$1.75 each. They are now made by the National Tube Co. at McKeesport, Pennsylvania, and cost \$1. The American flasks are superior to those made in England.

While on this subject it may be well to call attention to a curious fact in connection with

are needless. Mining companies using mercury in any quantities should provide a good long double lever, such as is shown in the cut, to remove the stoppers. The flasks are then worth something. At a great many mills, however, if the stopper does not readily come out, a center-punch is used to perforate the body of the flask, which is then unfit for use.

The Idaho Mining Co., Grass Valley, has declared its 228th monthly dividend, the amount being \$7.50 per share, aggregating \$23,250. The mine continues to yield largely, and is looking as well as at any time in years. The Idaho has produced over \$10,000,000 in all.

ASSESSMENT work on claims is now in order and should be done before the snow comes. There is no use in putting off this necessary duty until the last moment.

within a given distance from the foothills (or pronounced valley lands) to be held by the Government as mineral land and open to purchasers, up to the limit prescribed by law, to all citizens at a uniform price, say of \$10 an acre. This would be better for the Government, being double the price obtained for mineral land at present, and it would be far better for the miner, as it would save him great expense, loss of time and much trouble. This cheap and easy method of obtaining titles would greatly stimulate the mining industries. It would also enable every bona fide settler to purchase from the Government a title to the few acres that he actually cultivates around his house and effectually stop the present evil of closing large bodies of mining lands against prospecting and development.

Another method of relief that is frequently suggested and which involves no radical change

perity to the mining interests in their vicinity insures a ready market and a good price for all they can produce.

AN English company has been formed with a capital of £300,000 in £1 shares, 10,000 of which are now offered for public subscription at par, to acquire and continue to work as a going concern the Cortez mines situated in Esmeralda county, Nevada. The property contains 29 claims, and the prospectus states it has been for the past two years producing bullion of the value of \$60,000 a month, while the expenses are under \$12,000 a month, showing a net profit of about £115,000 per annum. The consideration to be paid for the property is £290,000, the entire amount being payable in shares.

THE United Miners of New Mexico, at their meeting held in Albuquerque, resolved to hold a Territorial exposition at Socorro next spring.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Eds.

Manganiferous Silver Ores.

[Written for the Press by A. L. TRIFFEL, JR.]

The *modus operandi* for the reduction of manganiferous silver ores, to obtain satisfactory results, involves a thorough knowledge of the character of the compound elements which enter into the combination.

The procedure in itself is comparatively simple, especially so if the silver element enters as a chloride in combination with some base metal oxides. In this case a raw amalgamation yields the best of results. If the silver, however, is obtained as a sulphuret in combination with copper, nickel or cobalt, necessitating a chloridizing roast, or if a minimum amount of base metal sulphurets, if any, are present, the process becomes more complex, requiring not only a knowledge as to the proper method of dressing and treating the ore, but close and faithful attention.

To more fully understand the reactions and treatment of this method of chloridization of manganiferous ores, a general description may be of material aid.

Ores of this character consist of the peroxide of manganese, in varying proportions, from 30 to 70 per cent, mechanically mixed with more or less sesquioxide of iron. Sulphate of baryta (Ba SO_4), silica (Si O_2), carbonates of calcium (Ca CO_3) and magnesia (Mg CO_3) are generally the principal compounds found associated as gangue. Oxides of cobalt (Co O) and copper (Cu O) in small quantities are also found, mechanically disseminated throughout the ore, but replaced, more or less, by silver as a sulphuret when the ore is argentiferous. Chlorides are also frequently found in this class of ore, varying in quantity, in speck, and streaks throughout the mass. The ore is light and pulverulent, of a black or dark-brown color, unctuous to the touch and easily crushed. When considerable iron is present the ore assumes a slightly reddish or light-brown color.

The sulphate of baryta (Ba SO_4) or barite (heavy spar), which is not always found associated with manganiferous ores, consists of 34.3 per cent sulphur trioxide (SO_3) and 65.7 per cent baryta (Ba O). It is insoluble, is not decomposed except by high heat, and in consequence, through its refractory disposition is of no use as a sulphate for the decomposition of salt. The carbonates of calcium and magnesia, however, are but too readily decomposed, yielding carbon dioxide (CO_2) and absorbing sulphuric acid ($\text{H}_2 \text{SO}_4$) forming the sulphates of calcium and magnesia.

For these reasons, with this class of ore, we see that an addition of green vitriol, iron pyrites or other sulphur compounds, when roasting is necessary, are essential to effectually cause a decomposition of salt. This decomposition is effected by the oxidation of evolved sulphur to sulphuric acid gas by the action of heat on sulphurets.

The presence of the oxide of manganese and iron, in this case, becomes of great importance for the production of chlorine gas, as will be seen by the following formula:

From this we see that the action of sulphuric acid ($\text{H}_2 \text{SO}_4$) on the oxide of manganese (Mn O_2) and salt (Na Cl) produces the sulphates of manganese and sodium, setting free chlorine. Free hydrochloric acid vapors are also created.

The hydrochloric or muriatic acid gas arises partly by the action of water absorbing sulphuric acid on the salt, whereby the sodium is oxidized by the oxygen of water vapors, whilst the hydrogen unites with chlorine to form hydrochloric acid in the form of gas. It is also formed by the contact of chlorine gas, with compounds of hydrogen, for instance, carbonated hydrogen.

This acid also acts upon oxides of manganese, evolving free chlorine and forming chlorides of manganese (Mn Cl_2), thus: $\text{Mn O}_2 + 4 \text{H Cl} = \text{Mn Cl}_2 + \text{Cl}_2 + 2 \text{H}_2 \text{O}.$

By these reactions the sulphurets of silver and other metals, as well as the base metal oxides, are reduced to sulphates. Upon increasing the heat at this point the sulphates of silver and base metal enter upon a direct exchange of compounds with remaining undecomposed salt, forming proto-chloride of iron (Fe Cl) and manganese (Mn Cl) and sodium sulphate ($\text{Na}_2 \text{SO}_4$). The chloride of silver (Ag Cl) thus formed remains undecomposed, while the protochlorides will, by coming in contact with gaseous products of burning fuel, containing water, or hot air containing steam, be resolved into their respective oxides by mutual decomposition.

A resume of the above process clearly shows that roasting in the first stage in the presence of salt has an oxidizing effect, as there is then no sulphuric acid present to decompose the salt. The sulphurets, under the influence of heat, lose a part of its sulphur escaping as sulphurous acid gas, while a further portion oxidizes to sulphuric acid gas. This (sulphuric acid) in turn attacks the salt and the oxide of manganese, in company with salt, creating directly and indirectly free chlorine, which, uniting with the oxides and sulphates, produces metal chlorides. These chlorides, with the exception of silver, are next oxidized by con-

tact with hydrogen compounds, liberating chlorine gas, which further chloridizes any remaining sulphurets of silver and base metals which may be present.

With manganiferous ores, particularly those having considerable lime or magnesia carbonates, therefore requires so much more green vitriol as will be absorbed by these carbonates to sulphates. Silica or quartz are not acted upon directly by the acids formed, but materially aids in the decomposition of salt in the presence of hydrogen compounds, forming silicate of soda and hydrochloric acid. With ores containing insufficient amount of sulphurets with a large percentage of calcium carbonate, two or three per cent at least of green vitriol should be added, otherwise poor chlorination would result. It may frequently be found beneficial, when the ore is calcareous, to add a silicate in roasting if possible.

If, however, as seems to be the case in several localities, the ore is roasted dead (iron pyrites being unobtainable), a small and I should judge a very unsatisfactory chlorination would result. The minimum amount of sulphuric acid created by the desulphurization of silver sulphides to silver sulphates would be almost entirely, if not all, absorbed by carbonate of lime if present, and, if absent, by the base metal oxides in forming but limited amounts of sulphates.

A small proportion of chlorine gas, created by the action of these sulphates on salt, however, will chloridize with the assistance of silica, I believe, a small percentage only of silver sulphate. It is in this manner that by dead roasting without base metal sulphurets only a minimum amount of silver can be chloridized. If a manganiferous ore is argentiferous containing silver as a sulphide or argentic ($\text{Ag}_2 \text{S}$), the ore is free milling, and as such it should be treated; otherwise a roasting process should be followed. It may be well before determining the exact process, which is to be carried out, to first ascertain by experimentation whether the ore, if not entirely free milling, would not give equally good results from a financial standpoint by raw amalgamation. Additional care should be taken for this determination (even though the ore contains small percentages of base-metal sulphides) when 20 to 30 per cent of the silver is chloride.

If raw amalgamation should be determined upon, difficulties identical to those in roasting will be met with. These may be overcome by proper quantities of chemicals—first for the neutralization of existing alkalies, and secondly, by the reduction of silver sulphurets to a chloride. To effect this change judicious grinding, aided by means of chemicals, will be found, I believe, effective to a certain extent.

The reactions (chemically) which take place in raw amalgamation, are nearly identical to those in a chloridizing roast. The salt, being dissolved, is attacked by the limestone (Ca SO_4) and we obtain a cupric chloride (Cu Cl_2) and sodium sulphate thus:

$2 \text{Na Cl} + \text{Cu SO}_4 = \text{Na}_2 \text{SO}_4 + \text{Cu Cl}_2$. When sufficient cupric chloride is formed, it acts directly upon the silver sulphide, and by our exchange of compounds produce silver chloride, thus: $\text{Ag}_2 \text{S} + 2 \text{Cu Cl}_2 = 2 \text{Ag Cl} + \text{Cu}_2 \text{Cl}_2 + \text{S}$. The sulphur produced by this reaction probably becomes oxidized to sulphurous acid, and acts upon remaining undecomposed sulphurets. The silver chloride in the presence of iron, is precipitated to a metallic state, in which condition it amalgamates with mercury. In these reactions and combinations, the oxide of the base metals do not interfere, and take but a small part in them. Whether or not the oxide of manganese and iron undergo any direct chemical change I am not prepared to say, but I think they do not.

Ore-Feeders.

EDITORS PRESS:—It will possibly be remembered by certain of your readers that an article appeared in your journal issued February 11, 1888, communicated by the writer of this and relating to a competitive test which had been held between the Challenge and Loftus ore-feeders in the mill of the Experimental Mining Company, near Columbia, Tuolumne county, this State. That article recited that the superiority of the Challenge was unquestionably demonstrated that the manager of that property ordered a Challenge to replace the Loftus, and the latter was "hung up to dry."

In June last, by a certain circumlocution known to the trade, eight Loftus feeders were placed on trial in the 40-stamp gold-mill of the Ilex Gold Mining Company, near Mokelumne Hill, Calaveras county. After a trial of them for a period of nearly 60 days, it has been decided by the resident manager of the property here and the board of directors of the company in London, England, that the eight Loftus feeders are to be discarded by reason of their inefficiency, and are to be replaced by an equal number of the Hendy Improved Challenge feeders, which are now being made ready for shipment by the Joshua Hendy Machine Works of No. 51 Fremont St., this city.

The writer deems it to be important, as it is necessarily of interest to all managers of mining properties, to direct attention to these facts, for the simple reason that those who are interested in or may contemplate becoming interested in mining enterprises are naturally desirous of securing such machinery, fixtures and appliances for their mining and milling plants, which are known and proven to be economical, effective

and superior for their specially designated service.

And thus one by one these mechanical abortions pass away; a large proportion are now "numbered among the things that were." Some were prematurely delivered, still-born; others of a mushroom growth, lifting their heads for a single night, blighted under the rays of the morning sun. Of the many forms of automatic ore-feeders which have been conceived, devised and introduced to the attention of intelligent mining men, none now exist save the Challenge, the Stanford, the Roller and the Tullock, and of these the Challenge, with the recent important improvements which have been introduced into their construction, make them far superior to any other form ever yet devised, and all others have been consigned to their last resting place, the scrap-pile, awaiting the final consuming fire. N.

Nevada Mining Notes.

EDITORS PRESS:—The State of Nevada has deservedly received the appellation of the "Silver State," and if the term was appropriately applied 20 years ago, the discoveries and developments of later years serve only to prove more conclusively the propriety in the use of the name. From the surface to the depth of over 3000 feet, this valuable metal (silver) has been found to exist in paying quantities, and this area of its extent is limited only by the boundary separating the States from Idaho on the north, Utah on the east, Arizona on the south, and California on the west. Having visited most of the prominent mining districts of the State within the past six weeks, I will give you a synopsis of the most important facts gleaned therefrom.

Near Carson.

During the latter part of July, Jefferys Lewis, of theatrical fame, gave an exhibition in Carson City, and receiving confirmation of the discovery of a rich silver ledge near by, made haste before departure from the neighborhood to locate and record his claim upon the same. The land upon which the discovery was made a short time previously was sold by Mr. S. P. Davis, editor of the *Appeal*, for \$1 per acre. Mrs. Langtry, "the Jersey Lily," who was the fortunate purchaser, was having an artesian well sunk, in the pursuit of which, the silver ledge was struck. The ore assays \$520 per ton. In a short time over 40 locations were made on the ledge, which is located $\frac{2}{3}$ miles north of the city. Doubtless this discovery will prove valuable, and I only refer to it to show that silver ore in Nevada is a commodity to be found almost anywhere, and frequently where least expected.

Virginia City.

Which has been and is still the chief mining camp in Nevada, is regarded as in a more healthy condition, so far as its immediate outlook is concerned, than for several years previous. During my sojourn of two weeks in August most of the mills were either closed or doing but little work, on account of the lack of water, but this suspension was regarded as only temporary. The coming fall and winter promise great activity throughout the Comstock. The yearly output of bullion has increased until, in 1886, the official report estimated the amount of silver and gold obtained from the Storsy Co.'s mines, which are confined principally to the Comstock lode, at \$4,393,000 for that year, deducting all assessments. Nor are the mines of this lode giving any indications of failing in the production of gold and silver bearing ore. A detailed account of the 65 prominent mines of the Comstock lode would occupy more space than you could well afford to devote in a single issue, and besides it would appear unnecessary at this time, for the simple reason you have published so much concerning them from time to time in prior issues, so that the public are perhaps better posted as to their true condition than about any other important mining district on the coast.

The Silver City Mining District.

Two miles west of Virginia, is developing a better prospect than ever before, although no excitement prevails. From Mr. E. P. Hamilton, president of the Hayward mine, I gleaned the fact that more bullion is now being extracted from the Hayward, Oest, and Leconte than for the past ten years. J. D. Blackburn, a prominent citizen of Silver City, and stockholder in the Red Jacket mine, placed me under obligations for a favor during my visit. The Red Jacket is one-half mile west of the town, was developed in '73, and patented in '81. By reason of unfortunate litigation, now happily terminated, this valuable property has lain idle, but the prediction is that the public will soon hear of startling results from its resumption of operations.

Winnemucca Mines.

The town of Winnemucca, Capital of Humboldt Co., owes a share of her prosperity to mines located in various directions from the place. In a aggregated range of mountains, four miles distant, is located the Winnemucca mines, which contain innumerable veins of silver ore. The Winnemucca Mining Co., composed of some of the best men of the town, is vigorously pushing the work of development. Already they have expended \$12,000 on one ledge. Owing to the refractory condition of the ore and cost of transportation, the success has not been complete, but now with cheaper

means of transit and improved processes lately introduced, much can be expected from this enterprise.

Golconda.

A few miles east of Winnemucca, is a very promising copper mining district. The ore contains considerable silver and gold also. The most important developed mine lies ten miles south of the station, and is owned by New York capitalists. The company propose to construct a railroad shortly to connect with the C. P. R. R. The lode has been traced six miles, and although the ore is of a low grade, the mines can be worked with good profit when the ore can be reached by rail. In this opposite direction from the station the country prospects well, in view of which Golconda is destined to become an important center. The place has other attractions, being the site of one of the best medical springs in the State.

Battle Mountain.

There are some rich copper mines seven miles southwest of Battle Mountain. The company employ 25 men at present in extracting the ore, and ship the same to England. The ore is being crushed at the Reno mill, but it is proposed to erect a mill at Battle Mountain soon.

The Pittsburg Consolidated gold mines are located a few miles southeast of Battle Mountain. They are said to be paying a good per cent on the investment. About 50 men find employment here.

The Mines at Austin

Have been in a stagnant condition for some months past, owing, it is asserted, more to bad management than to any other cause. Last year there were at this time over 300 men on the payroll of the Silver Mining Company, the principal active corporation engaged in mining here at that time, whereas this season there were only about 40, in consequence of which many miners were obliged to seek employment in other camps. To Mr. Samson, superintendent of the company, Mr. Vincent of the Nevada Central railroad, G. A. Carpenter, editor of the *Reveille*, and others I was placed under obligations for facts regarding the condition of things. All agreed that, notwithstanding the present state of affairs, the outlook was hopeful. The S. M. Co. transferred the property to a party of Chicago capitalists some months ago, and the incorporation that now controls it is known as the Manhattan Mining and Reduction Company. Austin was some years ago about the best camp of its size in Nevada, and those best acquainted with the undeveloped resources of the district say they know no reason why it should not again revive. It is the universal verdict of visitors that no community anywhere is more deserving of prosperity, the people being remarkably kind and affable. The town is connected with the C. P. R. R. by the Nevada Central R. R. Its management is in striking contrast with that of the Eureka & Palisades railroad, which connects Eureka with the C. P. R. R. While all the people of Austin spoke in highest terms of the former, it was hard to find any business man of Eureka who could employ terms severe enough to express his denunciation of the latter, on account of the extortionate rates of fare and freight imposed upon the public. The Nevada Central R. R. is a narrow-gauge 90 miles in length. The superintendent is C. W. Hincheliffs, with headquarters at Austin. The writer found the trip a pleasant one by moonlight.

Eureka.

Ninety miles north of Palisades, C. P. R. R. has also seen far livelier days than at present. Like Austin, her people are generally sanguine of a bright future, and when it is considered that within the Eureka mining district there are over 400 patented mines and about 75 unrecorded, there seems to be ample cause for the view held by the business men of the town. The two principal mines upon which the prosperity of Eureka has always depended entered into a combination some months ago, raising the price for smelting to a figure almost equivalent to prohibition, or at least a rate that had the effect to stop the delivery of ore at their mills; consequently the little work that has been prosecuted of late has circulated no ready money, the miners simply leaving their ore on the dump. Those who tried the experiment of shipping to smelters abroad, though realizing more than offered at home, found it too expensive to engage in on a large scale. Some idea of the past importance of Eureka as a mining camp may be estimated from the fact that the Richmond M. Co. and the Eureka Consolidated, two of the leading companies, have declared in dividends up to date over \$7,000,000.

Up to a comparatively recent date, little attention has been paid to agricultural pursuits conducted on scientific principles in Eureka county. A few have followed stock-raising in the primitive way, and, as an accessory, improved some hay ranches; further than this the general progress has not been creditable. Now, however, steps are being taken toward a more thorough development of the latent resources of the soil, and it seems to be the resolve of the enterprising citizens not to allow the country to depend altogether upon the less certain fortune of the mines. A company has lately been organized to bore for artesian water, which, if successful (and from the fact of water being known to exist near the surface of large arid tracts, the experiment is almost certain to succeed), must revolutionize the farming industry and make the country at least a hundred-fold

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

SUTTER CREEK.—Amador *Ledger*, Oct. 6: Drifting in the Wildman mine has been delayed on account of a portion of the shaft needing repairs, which they have been doing the last week. At the Lincoln a drift is to be run from the foot of the hill near the old shaft formerly worked by R. C. Downs. There is a raise of about 100 feet, and if they can strike the ledge at that depth it will give work perhaps for years. H. C. Callahan is up from San Francisco looking after matters pertaining to the Sutter Creek mine. There is a proposition on foot to connect their mill pipe with the Mahoney pipe, which will furnish them with water the year round. They have a very good ledge in sight. The Leggett and Manditch claim, about six miles above here, was sold last week principally to S. D. R. Stewart. The price to be paid is \$10,000. There is to be a ten-stamp mill put upon the claim right away.

AMADOR GOLD MINE.—*Ledger*, Oct. 6: Preparations for the building of the 60-stamp mill at this mine are making satisfactory headway. F. Masoni has secured the contract for building the retaining wall, and is now busy at work on the same. This wall when completed will be 107 feet long, 3 feet thick and 12 feet high. When this wall is finished the work of putting the mill together will be inaugurated. They commenced on the battery-blocks last week. It is expected to have the mill in running order about Christmas. At present there are 30 men employed at the mill and 25 at the mine, besides four teams.

MISCELLANEOUS.—The Gillick mine is still working with promising prospects. Another effort is being made to bond the Doyle mine in Hunt's gulch in the interest of English capitalists.

DRYTOWN.—Cor. Amador *Dispatch*, Oct. 6: The Overplus mine at Quartz Mountain has resumed work again. Mr. Goodman, the owner, is putting up a five-foot Huntington mill, and will move the Frue concentrators from the Quartz Mountain mill to the Overplus. The ore will pay \$6 to \$8 per ton free gold, and about three-fourths per cent in sulphurets which are worth \$500 to \$600 per ton. The Cosmopolitan is down 500 feet; they will soon sink a shaft; then drifting will be in order about the first of November. The Gover Co. broke ground on its new reservoir on Monday; they will push it with all possible speed so as to get the pipe laid before the rain. In all probability the mine and mill will be run by water from Quartz Mountain by January 1st. The mill is kept running steady of late.

Calaveras.

ACTIVE.—Calaveras *Chronicle*, Oct. 6: The mining industry is quite active. The Blazing Star has started again and will soon commence to take out ore. The newly-erected 10-stamp mill at the Cook mine commenced crushing rock on the first of the month, but owing to the scarcity of water five stamps only were started. Mr. Schae is the present owner.

WATER SCARCE.—Angels *Echo*, Oct. 6: The scarcity of water in our section rather retards milling progress to some extent.

GOLDEN EAGLE.—The Golden Eagle mine, situated near Albany Flat, and owned by Messrs. Gerkins and Swartz, is showing up splendidly. Two shafts have been sunk, one to the depth of 40 feet, the other 25 feet. A large vein 12 feet in width shows up well.

El Dorado.

DRIFTING.—Georgetown *Gazette*, Oct. 4: J. J. Busick of the McCall mine at Gray Eagle Bar, was in town to-day. There are 15 men engaged in drifting.

Los Angeles.

COAL AND IRON.—Newhall *Times*, Oct. 6: We met Colonel Brophy Saturday, who gave us a few notes on what has been discovered on his ranch about two miles southwest from Newhall. About 14 years ago outcroppings of coal were found, but the lead was not opened up until recently. There were three well-defined veins of coal of 5, 7 and 4 feet thick, and the coal that has been taken out is of a very superior quality. It mines easily, and is of a superior quality, burning to a yellow ash, without any clinkers. The coal has also discovered five leads of magnetic iron running from 15 to 30 feet thick, and which goes 50 per cent iron. There are two different parties of capitalists who have made overtures to purchase the mine, and it is very probable that it will be sold within a short time.

A GOOD REGION.—Ed. Lyon came down from Ravens Wednesday and brought quite a number of specimens of quartz to be assayed. He says there is quite a mineral region about ten miles southeast of South Side station. He has two claims of gold-bearing rock, one with a well-defined ledge of 6 to 9 feet, and which goes \$20 to \$30 per ton; the rock is free-milling gold, with good traces of silver. It is so easily worked that \$3-ore would pay well. There is plenty of wood and water on the claims, and the cost for working could be figured down to the minimum point. He has a tunnel in 20 feet and a shaft 16 feet, and the ore improves as he gets into it. His other claim has a ledge with an average of two feet and which goes from \$27 to \$30 per ton. Claims of Jones, Green, Botsford and Miller are also in the district, all being worked and all getting out good ore.

Mono.

THE BODIE.—Mono *Relief*, Oct. 1: Have put in a new pump tank on the 600-foot level and have repaired the 200 and 400 tanks, and the 300 bob and bob pit. Are making as good headway as can be expected in repairing breaks on top.

THE STANDARD CON.—Number of men employed in and about the mine, 20.

THE BULWER CON.—For the past week north drift, 200-foot level, was advanced 16 feet. North drift, 360-foot level, was driven 8 feet.

VITALITY IN LUNDY.—Mono *Co. Relief*, Oct. 1: On Wednesday Dr. A. B. O'Connor and G. W. Butterfield arrived in Bodie direct from London, England. They left on Wednesday afternoon for Lundy. Dr. O'Connor represents an English syndicate (in which he himself is a large shareholder).

This syndicate has bought up a group of mines at Lundy and incorporated as the Homer District Consolidated Gold Mining Company. There is ample capital behind the company to do all the legitimate mining the managers may see proper. Dr. O'Connor will at once thoroughly investigate his purchase, and if his prospect proves favorable will immediately proceed to open up and develop the entire group of mines, and work them for all they are worth as a legitimate mining proposition. This company is not prospecting for stock jobs. A fair percentage on the money which they propose to invest is all they ask for, all they hope for, all they expect. Every old practical miner knows that the hills at Lundy are full of mineral, and we incline to the belief that inside of a year the Homer District Con. will be taking it out in very respectable quantities. We suspect that Dr. O'Connor will find that he arrives in Lundy at a bad season of the year to do much real work; but he can so arrange and shape his plans during the fall as to be ready to make things hum when spring opens.

Nevada.

SENECA MINE.—Herald, Oct. 6: This mine is located on the mountain-side just south of the Middle Yuba river and directly north of Badger Hill, being about two miles down the river in a direct line from the now famous Delhi. When the ledge was first discovered some of the loose croppings were crushed and yielded \$2.50 per ton. A tunnel was then run in the hillside to strike the ledge at a depth of 100 feet and a crushing was taken out which yielded \$10 per ton in free gold. The company then descended the mountain-side and run a prospect tunnel 150 feet lower down or at a depth sufficient to give 250 feet of backs to stoop out if found to pay. The lower tunnel reached the ledge a few days ago and is being run on the line of the ledge to determine its extent. The ledge thus far in the lower tunnel is over three feet thick, and the rock shows some free gold. The quartz being taken out in running the drift ahead is being hauled to J. Hustler's one-stamp prospect-mill to be crushed to ascertain its richness. The situation of the mine is most favorable for cheap working. An abundance of water with good fall for pressure is easily obtainable and the extraction of ore can all be done through tunnels, so there is no hoisting required.

COLUMBIA HILL.—North San Juan *Times*, Oct. 5: Geo. Baker and J. A. Jones have been working on the Golconda for the last couple of weeks. At a depth of 20 feet they have struck a 5-foot ledge, which prospects exceedingly well. They are well pleased with their prospect. J. A. Craig is prospecting for gravel near the Eureka Lake Company's sawmill. He has an incline down about 30 feet and expects to strike the gravel within the next 5 or 6 feet. Mr. Craig deserves to strike it rich, as he has done a great deal of prospecting in the last couple of years. The Seneca Co. has a 2-foot ledge, which is said to be rich in free gold; Cherokee has consequently received quite a boom. The El Dorado Co. is still driving their tunnel ahead, but as they have very hard rock it is slow work.

STILL ANOTHER MINE.—Tidings, Oct. 6: Heavy owners in the Pawning mine, which adjoins the Coe, say that if the work is resumed on the last-named property by a good company, they will put machinery on their claim and also resume work. As matters stand at present, the water in the Coe would have to be handled by the Pawning Co.

Placer.

SALE OF THE HATHAWAY MINE.—Placer *Herald*, Oct. 6: James Butts has sold the Hathaway mine, near Ophir, to Valentine Bros. of San Francisco for \$12,000. This is a valuable quartz mine. The vein is about 4 feet thick, and the pay chute is 1000 feet long at the depth of 180 feet. The rock pays from \$10 to \$12 per ton, free milling. The sulphurets average about three per cent. This ledge is supposed to be the monster lode of the Ophir mining district. Valentine Brothers will at once put up hoisting works, and will sink the shaft to the depth of 500 feet. They will also complete a 10-stamp mill. The new managers expect to produce gold bars within 90 days. The mill will be run by water-power. Geo. Horn, the manager of the Valentine mines in this State, will take charge of the mine.

FOREST HILL DIVIDE.—Placer *Herald*, Oct. 6: Very little work is doing at Yankee Jims in the mines. Welker & Kennedy are running drifts in their Georgia Hill mine preparatory to the systematic working of the mine. Charles Trafton is running his tunnel ahead into the same hill, and enlarging it. Georgia Hill has yielded an immense amount of gold, having paid from the grass down to the bedrock. There is no doubt of the existence of a back channel, which will yield a rich harvest whenever it shall be struck by the lucky prospector. At the Gray Eagle mine, Mr. Durning is busy erecting new hoisting works. The shaft is down to bedrock and is over 350 feet in depth, and the old hoisting works are not strong enough to do the work. The Dardanelles is paying richer than ever. The gold is coarse and heavy and plentiful, and is exactly like that in the rich Mayflower channel. The gravel is also of the same character as that of the Mayflower. The mill is running night and day, and works to perfection. All the works are now under roof. The work is going along satisfactorily under the skillful management of Supt. W. H. Grinnel. The mine is dry and well ventilated, and is a very comfortable place for the men to work in. Gen. Hamilton employs about 60 men, and is enjoying a revenue of several hundred dollars a day over and above running expenses. Supt. Chappellet is pushing the work at the Mayflower. The tunnel, on Sept. 30th, was in 5503 feet. At this point they have begun an upraise and will doubtless be in the channel before this item appears in print, as they expect to run 20 feet only. As soon as gravel is struck and drifts are run and other preparatory work is done, a large force of men will be put on, and we can expect to hear of wonderful developments. This mine is the richest on the divide, having yielded \$93,000 in eight months, and when, owing to the difficulty of handling the water, the bedrock was not cleaned or creviced; but now the tunnel will drain the entire mine. At present there are 32 men at work in the hoisting works and tunnel. Twenty-seven men are working at the new mill at the mouth of the tunnel. This mill is a mammoth one, and will contain 20 stamps. It will be worked by steam and water-power. Mr. Chappellet expects to have the mill finished by the 10th of November. At the Live Oak some five men are at work running a drift

from the upraise which connects the tunnel with the upper lead. This upraise begins at a point 1800 feet from the mouth of the tunnel and is 65 feet in length. The drift will connect the Naugatuck ground with the Live Oak. This drift will be 50 feet in length and is in gravel ten feet in thickness. This gravel prospects very well, and is expected to pay well when the ground has been put in proper shape for working. The gold is fine. Supt. Dodge is extending the second upraise in the Baker Divide tunnel, and intends to drift from it in a direction parallel with the course of the tunnel. Mr. Dodge employs ten men. J. C. Scott has men at work on his mine on Volcano canyon. He is preparing to open up his claim there. The Brece & Wheeler claim gives employment to 25 men. The breast is 60 feet in width, but the yield this month is not so large as it was the preceding month.

Plumas.

A RICH STRIKE IN THE DRURY.—Greenville *Bulletin*, Sept. 30: A very rich strike was made in the Drury mine. Mr. Drury has been driving the middle tunnel ahead. On one side of the main lode is a vein of quartz and dirt which is the richest we have ever seen. Out of two pans of dirt and quartz \$30 was obtained by washing merely. As much more is in quartz therefrom.

THE PLUMAS EUREKA MINE continues its operations with the usual regularity and success. John Hosking is superintendent, T. B. Inch, clerk and head accountant, and Wm. F. Johns assayer. There are over 200 men on the pay-roll, most of them from Cornwall. It is the policy of the management to employ only men of sobriety. The greater part of the ore is taken out through the lower tunnel. The 40-stamp mill is one of the best equipped in the country. The corporator has its own assay office, over which Wm. F. Johns presides.

Shasta.

AT OLD DIGGINGS.—Redding *Free Press*: Superintendent Morton of the Josephine and Providence mines at Old Diggings, recently purchased by Walker Bros. of Salt Lake, came up from Greenwood this week with a number of experienced miners and has started the development of these excellent properties in a business-like manner. A 20-stamp mill arrived this week for the Union Consolidated mine. The proprietors, Murray Bros., have also purchased a rock-breaker from Bell Bros.

Sierra.

OXFORD.—Mountain *Messenger*, Oct. 6: The Oxford Mining Co. (Old Gold Hop-) have struck porphyry in their tunnel. It is considered that they are not far from the ledge, as its northern wall, in the tunnel above, was porphyry. A force of men is at work at the Marguerite mine getting the mine in condition to work after its being shut down for several years. The water ditch belonging to the Dutch company has been leased, and a refusal of its purchase for \$5000 has been secured. The Buffalo Quartz Mining Co. of Hog Canyon have, within the past week, completed arrangements for building a new mill on their claim and now have about 20 men at work grading a millsite and doing other preparatory work.

THE BUFFALO.—Sierra *Tribune*, Oct. 6: The owners of the Buffalo mine have concluded arrangements to erect a mill at their mine. Ernest Busch, who has been at San Francisco for the past few weeks, telegraphed up that he had purchased the ten-stamp plant at the Columbo mine, and another telegram was received by those who have in charge the latter property to turn the mill over to the Buffalo Co. Van Slyke's sawmill at Butcher Ranch has already started in to get out the necessary lumber for the mill, boarding-house and blacksmith shop. It is proposed to push the work along with all possible speed so as to have the mill in running order before snow flies. The mine is in splendid condition.

A RICH STRIKE.—In the lower tunnel of the Glidden mine, Gold Valley, this week there was encountered a vein which measures from two to three feet in width, which shows up very rich in free gold. This tunnel is in the hill about 80 feet, and 200 feet in depth from the surface. The Glidden mine promises to become a bonanza to its owners, who are Mat Willoughby, William Jones, O. B. Dolley, and F. L. Glidden. Ed Lawrence and Jack Branden visited the San Luis mine day before yesterday. The tunnel is in 397 feet. The rock is getting softer and the indications are that the ledge is in close proximity. Thos. Murphy is prospecting a quartz ledge above the Chipp mine. The outlook for a mine there is considered quite favorable.

NEVADA.

Washos District.

UNION CON. AND MEXICAN.—Virginia *Enterprise*, Oct. 6: The joint Union and Mexican north drift, started from the Ophir shaft on the 1465 level, has been extended 60 feet; total length, 470 feet.

CON. CAL. & VIRGINIA.—The south drift on the 1435 level is in vein material, giving low assays. The stipes east of the winze on this level continue to look and yield well. On the 1500 level the stipes on the southeast drift yield well. On the 1600 level ore is still being yielded by the stipes south of the Ophir line and 35 feet above the track floor. The stipes on the south drift and winze are showing much good ore. The usual amount of ore has been shipped to the mills and the assays average about as last week.

GOULD & CURRY.—On the 200 level east crosscut from the top upraise from the 300 level (or El Dorado level) has been extended 20 feet; total length, 77 feet. The formation is low-grade ore. The west crosscut started from the top of the same upraise has been advanced 32 feet. The formation is quartz giving low assays.

OCCIDENTAL.—Have completed repairs on the chute in the north incline winze. Extracted 140 tons of ore; shipped to the Atlanta mill 137½ tons. Average assay value, by wagon samples, \$25. Bullion shipped to San Francisco office, total yield from the Atlanta mill for September account, assay value, \$5657.77.

CROWN POINT.—The main south drift on the 700 level is again being pushed ahead. It is passing into ground of a promising appearance. The Suro tunnel drift is making good progress and will be connected in a short time.

BALTIMORE.—Are still operating on the 338 level. The machinery is working well, and there is

no trouble to handle all the water that comes in. The company will soon begin crushing ore at their own mill on the ground.

HALE & NORCROSS.—The drift west from the new 800 station is out 96 feet. The connections made will not only be of great advantage in working the mine, but will materially improve the ventilation.

IMPERIAL GROUP.—The Con. Imperial, Challenge Con. and Confidence mines are still closed down pending the repairs of the hoisting works at the Yellow Jacket shaft, through which they are all worked.

BEST & BELCHER.—On the 300, or El Dorado level, west crosscut No. 1 from the main northwest drift, has been extended 22 feet; total length, 258 feet. The formation is porphyry.

SIERRA NEVADA.—East crosscut No. 3 from the main south drift has been extended 50 feet; total length, 556 feet. It continues in porphyry filled with seams of clay.

ALPHA AND EXCHEQUER.—East crosscut on the 382 level of Exchequer is out 157 feet. The east drift in Alta is out from the old shaft 165 feet.

CHOLLAR.—The drift west from the 350 station has been extended 40 feet; total, 120 feet. The face of the drift is in clay and porphyry.

JUSTICE.—The work at the new mill is progressing well. Are steadily hoisting ore from the different reserves in the mine.

SAVAGE.—A good deal of work has been done on the several levels in the way of repairing and easing up timbers.

SEG. BELCHER.—Work confined to south upraise, where good progress is being made in a favorable formation.

ALTA.—Are engaged in making repairs to the main shaft and to the hoisting-works building.

LADY WASHINGTON.—Are making good headway in the raise above the 725 level.

YELLOW JACKET.—A good deal of repair work of various kinds is in progress.

KEYSTONE.—Good headway is being made in sinking the main incline.

Bristol District.

COPPER FURNACE.—Pioche *Record*, Oct. 6: The Roe Bros.' copper furnace at Bristol has been running for about a day. Fourteen tons of bullion were shipped to Milford last Tuesday. About 16 tons more will be produced, when a stop will be made. The present price of copper makes the business profitable, and we hope the boys will gather in a few thousands of the fortune which Bristol District certainly owes them.

Cottonwood District.

NICKEL.—Cottonwood has had hoisting works erected, and the nickel and cobalt increases in richness as depth is attained.

ALASKA.

ADVANCING.—Free *Press*, Sept. 29: Although Alaska has experienced no great boom this season, the country has nevertheless advanced very rapidly; a number of large mining sales were made, which are the foundations for the near erection of a number of large stamp-mills, and a large amount of development on mining property has been done. The Treadwell mine has been a steady producer, the placer mines in the Basin have yielded well in gold dust, and late reports from the Yukon would indicate that the section will pan out this season in excess of last, not owing to any new discoveries being made, but to the increased number of men that have been mining there. When all reports come in this fall from both the Yukon and Copper river regions and from Cook's inlet, we confidently expect to hear of a number of rich discoveries as the result of the past season's prospecting.

COAL.—Although a number of men have devoted this summer to prospecting for coal in this near vicinity, nothing has yet been struck. Prospectors should bear in mind that around here the formation is not coal bearing. There is a sandstone belt to the north and one to the south, in which good coal veins might be found.

RICH ORE.—Andy Anderson now has a ton of \$500 ore packed down from the mine to his camp on Sheep creek, and siwashers are now packing it down to the beach; it will be shipped below on the Ancon. Andy, working alone, takes out about 125 pounds ore daily, making two trips daily packing it down to camp. Specimens of ore from this vein will run 2000 ounces silver and from \$50 to \$200 in gold per ton.

ARIZONA.

WALKER DISTRICT.—Prescott *Courier*, Oct. 1: J. N. Rodenburg has come in from Walker district. From him we get the following items: He has built a house and is going to put men at work in his Berlin mine. N. L. Griffin and Fred Sable are sacking ore from the Fortune mine. Frank Kuhne will shortly ship two carloads of ore from the Belle mine. The Amulet is yielding lots of rich ore. John King is getting ore that will work \$800 to the ton. Mike Chandler is making from \$4 to \$5 a day in his placer claim. The district will poll about 60 votes. Harlan & Barrington, owners of the Howard mine, were at the Bank of Arizona Saturday last with over 400 ounces of gold product of five tons of rock. The "bar" is worth nearly \$7000. Water is increasing and they will soon run the mill ten hours each day. G. K. W. McNary has just located two very rich ledges in Copper basin. Ore is rich in silver. Walter Murphy of Jerome says two cars a day of silver-copper bullion are being shipped East. Van Name's mill is crushing rich rock. N. L. Griffin, a pioneer miner of Walker district, has brought in a shipment of ore. A. J. Park says miners are prosperous in Hassayampa district. John Dawson and John Taylor have finished assessment work on the Gray Eagle, Bradshaw district. E. L. Gobin, miner and millman, says times are improving in Peck district.

THE WATERVALE.—Tombstone *Epiphany*, Oct. 1: From Superintendent Coffman, of the Watervale Mining Co., it is learned that the double compartment shaft, now being sunk in the Bunker Hill, is down 335 feet. Three shafts are running and work never ceases. The large double engine, now in construction in Chicago, will be finished and shipped

about the middle of October. Shipping receipts have been received by Mr. Coffman for 20 tons of material now on the way, including boilers, ore-cars and other machinery. The capacity of the new hoist is not exactly known, but it is sufficient for a depth far below the water level. The Rattlesnake, Mammoth, Bunker Hill and other properties of the Watervale Co. are rapidly developing under the able management of Mr. Coffman into bonanzas.

MORAVE, — Miner, Oct. 6: There are 60 tons of ore from the C. O. D. on the ore platform at the sampling works ready for working. The Lone Star, at Mineral Park, is producing better ore than ever before. The ore streak is six inches wide, but very rich. It is rumored that a ten-stamp mill will soon be erected on Stockton Hill, and that Prescott parties are interested in the matter. Supt. Campbell of the Flores brought in Tuesday a bar of bullion valued at \$1500. The recent strikes in the Flores are developing finely, and the ledge is widening and increasing in richness. E. F. Thompson this week sold the Vanderbilt mine at Cerbat to a Philadelphia syndicate for \$10,000. Since the first of the year two miners have taken about \$7000 out of this mine, and it is considered one of the best properties at Cerbat.

AROUND PRESCOTT, — Journal-Miner, Oct. 6: Col. Bigelow has six tons of ore on the dump ready for shipment, and expects to complete a load this week. Work is being pushed on the smelter for the Copper Basin Copper Co. Work will be commenced again soon on the Perry mine, a property which has yielded several thousand dollars in gold ore. The United Verde Copper Co., a few days since, started up another 30-ton smelter, having two in operation now. Nearly two carloads of ore arrived at the sampling works yesterday from Congress mine, and the above institution is crowded at present. Charles A. Girdler and Dr. Vickers have been experimenting to-day with the treatment of sulphurets ore from the Congress mine, by means of electricity. Walter Wright continues to run the Del Pasco mill with good success as water can be obtained. He has an abundance of ore, but water is scarce. Freighters are engaged in moving a smelter to the Hillside mine, and the owners of that property expect to commence smelting their ores soon at the mine. The Crowned King continue to run their pack train getting ore to the mill, so as to be ready for a continued run when the water becomes plentiful, which is at present very scarce. A deed has been filed for record from John Lawler and Jules Baumann, for the Lawrence and Manzanita mining claims, Agua Fria district, the price named being \$10,000. Geo. W. Sines returned yesterday from a trip through the Hassayampa mining district. He says the new shaft in the Senator is down to a depth of 100 feet, and is in good ore at the bottom. Messrs. Harlan and Barrington, of the Howard mine, brought in another bar of gold bullion to-day, weighing 402 ounces, a total value of \$6834. This bar was the result of a run of five tons of ore from the mine. The property is not yet opened up to any great extent, but has yielded some \$20,000 or \$30,000, and has several hundred tons of ore in sight. J. M. W. Moore, of the Prescott sampling works, reports the largest receipts of ore yesterday, at those works, of any single day since they were started, amounting to over 40,000 pounds, or more than two carloads. Of this, 23,000 pounds were from the Congress, the remainder being from Lynx creek and Hassayampa districts. Captain A. T. Brann has just returned from a trip through the Bradshaw country, and reports the greatest activity there. W. B. Long, superintendent of the Ora Bella, has about 75 men employed in the mines and building roads.

COLORADO.

LEADVILLE NEWS, — Denver Tribune-Republican, Oct. 6: The Castle View mine on Carbonate hill was leased a few weeks ago by the Castle View Mining Co. to Captain Eben Smith. To open and drain the property a long shaft is being driven from the Henriette and Maid workings through the Big Chief to the Castle View. When drained, the Castle View will be worked through its own shaft. This is one of the most important enterprises in progress in Leadville at the present time, as it will make two more producing mines. The Big Chief, which has ore but has been much troubled by water, will commence shipping, and likewise the Castle View. The latter mine has been idle for some months on account of trouble in the company. The body of pyrite ore which was discovered some weeks ago in the Moyer, by a drift in the ore chute east of the shaft, is proving to be a very fair channel of good ore in the midst of the great body of low-grade sulphide ore. The Colonel Sellers mine is doing as well as usual, and in September will make its regular monthly output of about \$50,000. The Glass-Pendery has started work again with its new plant of machinery. The shaft is being sunk at the rate of from 3 to 4 feet per day. Mr. H. B. Slater has returned from an extended business and pleasure trip through the East. While in Washington he secured the patents for his new process of treating bluish silver ores. Experiments with the process are now being made in Denver. If these experiments are successful, as they are likely to be, it is more than probable that a plant of 200 tons per day capacity will be erected in Leadville by the Iron Silver Co. for the purpose of treating the low-grade sulphide ore of the Moyer mine before the winter sets in. Some ore was struck unexpectedly in the Virginus on Wednesday. A raise is being made through the flint to open a new stop in the body of iron ore overlying. In the flint the raise cut a body of lead carbonate ore two feet thick. The ore was of excellent grade, assaying 55 per cent lead and about 40 ounces silver.

IDAHO.

SHEEP MOUNTAIN, — Ketchum Keystone, Oct. 1: Numerous parties have of late arrived in Ketchum from the Sheep Mountain and Seaford districts for the purpose of marketing ores, shipping in fall supplies, etc., and nothing but the very best of reports reach us in regard to the outlook in that country. It is a fact beyond doubt that a number of mines there have large quantities of rich ore on the dump which is held simply in anticipation of better freight and reduction facilities. The mine-owners there unite in the statement that there is sufficient ore of desirable character in sight to warrant the establishment of smelters of moderate capacity, which, it is

the universal opinion, could hardly fail of success in the treatment of custom ores. The reported richness of mines in that region is corroborated by every miner who has been there. Most of the miners will, however, come out for the winter season, and we learn the store and bar in the camp of Seaford have already been closed.

THE TISHMINGLE, owned by Mr. Harland, is one of the richest locations in the district. It is developed by several cuts on the ledge and one tunnel 22 feet in length, in which the ore is in place and continuous, showing several feet of very high-grade ore, and about ten inches that will assay in the neighborhood of 1000 ounces. There is a vast amount of ore in that country that is deceiving in character, much of which may prove to be very valuable. The formation is granite and lime with an occasional porphyry dyke. The ores are chiefly "dry," carrying less than 20 per cent lead, traces of gold and large quantities of silver.

PLACER DIGGINGS, — Kee Levah, a well-known China laundryman of this place, returned from Smoky a few days since with 15 ounces of gold dust, the result of four Chinamen's work for 30 days on a new prospect in that district. The ground is extensive and easily worked, the bedrock being but seven feet from the surface, but the ground thus far has not produced over \$2 a day to the man.

YREKA DISTRICT, — Wardner News, Sept. 29: The owners of the Emma and Last Chance mines have every reason to feel proud of the development of their property. The Last Chance is proving a veritable bonanza, and when the same amount of work has been done on the Emma, similar results may be expected. The Spokane Company's concentrator at the foot of the mountain is now in thorough working order and is kept running uninterruptedly.

ELK CREEK, — O. A. Brown, the original discoverer of the Elk creek gold mines, sold on Thursday all his interest in that property to Messrs. J. F. Wardner and B. Goldsmith.

LALANDE DISTRICT, — Nothing new can be said about the Poorman mine at Burke beyond the fact that increased development but adds additional proof of the vast resources of the property, and the new concentrator is working to a claim. Supt. Clark says: Out of 100 to 120 tons of second-class ore, it produces 25 to 30 tons concentrates, which assay 65 per cent lead and 40 ounces silver.

DIAMOND HITCH, — Supt. B. B. Jones is more than pleased with the result of his labor on the Diamond Hitch mine. During the week the property was visited by Prof. Price of San Francisco, who expressed himself in unqualified praise of the good showing made in the mine, and says he has every confidence in its becoming a great ore-producer.

EAGLE DISTRICT, — The ditch being built by Syd Mills to convey water from East Eagle creek to Fancy gulch is nearing completion, four miles of the work being now finished.

CEUR D'ALENE DISTRICT, — The owners of the Mother lode made a rich strike last week in their middle tunnel by exposing a body of ore from 3 to 4 feet in width, bearing plenty of free gold. The tunnel is in 160 feet and development work continues day and night. Scarcity of water compels the necessity of working the arastra only occasionally.

MONTANA.

GERMAN GULCH, — Inter-Mountain, Oct. 1: Dr. G. W. Beal came in from his placer mine in German gulch to-day and speaks in glowing terms of the favorable outlook for the new camp at the junction of German and Blacktail gulches. He reports some valuable lead discoveries being made there and a great deal of work in progress. The Anaconda Co. purchased a half interest in Thomas Newcomb's properties last week, from the good showing made in the Newcomb lode, which is down 40 feet.

THE LOWLANDS, — Inter-Mountain, Oct. 1: At the Butte City Sampling Works there was received on Wednesday a quantity of ore from the Amazon mine, in the Lowlands, which was assayed, and the result was \$490 in silver and 20 ounces in gold. This is about the richest quartz that has ever been brought to Butte, and the owners say that they have plenty of it in the Amazon mine.

THE RUBY MINE, — It was reported on the streets yesterday that another pocket of wonderful richness has been discovered in the Ruby mine, in the same district. Since the Anaconda Co. left the mine the owners have been at work and opened up this new find. It is said that the gold runs like wire through the rock and by breaking a piece of ore the yellow metal hangs together in threads. The proprietors of the Ruby express themselves as pleased that the Anaconda Co. did not take up the bond of \$200,000 on the mine.

CASTLE MOUNTAIN MINES, — Butte Inter-Mountain, Oct. 1: The great strike of the season has just been made by Ben Johnson and John Davis at the head of Thompson's gulch, about 15 miles west of White Sulphur Springs. This consists of a six-foot vein of gold ore that yields two or three cents per pound in both the lead matter and the regular ore from wall to wall. Mr. Johnson is of the opinion the ground will also pay for working for placer gold. This lead is believed to be the source from which the rich deposits of Thompson gulch came. There has been a big strike made recently in the Grasshopper lead, situated about six miles east of town. The rich body of ore was found about two weeks since, but the matter has been kept dark. The find consists of a four-foot vein of solid ore that runs in the hundreds. About six inches of this is very rich and assays 2000 ounces in silver. Several undeveloped properties in the vicinity of the Alice and Judge mines have recently been sold to capitalists. Such prospects rate at about \$500 each.

THE ALICE MINE, — The ore from the Alice mine is worth \$170 in silver and lead. It costs \$75 per ton to haul it to Toston, \$35 to treat besides, or 10 per cent, leaving a net income of \$40 per ton for mining. The mine is now developed to a depth of 100 feet, and a force of men has been set to work stopping. It is estimated that it will require three months to take out the ore in sight.

DEWEY'S FLAT, — Inter-Mountain, Oct. 2: The most profitable mine now in operation in this vicinity is the Lone Pine, owned and operated by the Partridge Bros. Their plant is on the Big Hole riv-

er, two miles below Dewey's Flat. Their power is a turbine wheel. The mine is on Quartz hill nearly 10 miles from their mill. During the first years of their ownership the mine did not prove very profitable. Only fair wages were made and nothing more. But for the last two seasons it has been improving very rapidly, running up from less than 20 ounces to an average of nearly 60 ounces per ton. During this time they have followed the ledge down some 300 feet. The Partridge Bros. are the only ones who have made a success of the Jones pulverizer of Portland, Or. They seem to experience no difficulty in regularly crushing about five tons when they have water to run all day. They amalgamate by the barrel process and save up to a high percentage that way. Allen Hay is steadily running his little mill at the Flat and is crushing ore from the old Quartz hill mine. This property is also improving in size and value as they attain depth, and from present appearances would amply repay the erection of a large mill. Quite a large amount of prospecting is now going on between Quartz hill and the Vipond district. About 20 men are engaged on different locations there.

PHILLIPSBURG DISTRICT, — Butte Miner, Sept. 29: H. K. Fairgrieve of Phillipsburg, M. T., reports the burg to be exceedingly active. Both the Granite and Bi-metallic mills are pushing their building operations. Superintendent Risque of the Bi-Metallic Co. has his company's mill on Douglas creek almost under cover. Much of the machinery is on the ground. Their mine is in most excellent condition, with enough ore on the dump to keep the new 50 stamps in constant operation for months.

SAN FRANCISCO, — Superintendent Eugene Smith reports this mine in most favorable condition. The east 400 is looking exceedingly well. This company has purchased a millsite just west of town and expects to break ground for reduction works early in the coming season.

THE PEARL MINE is looking phenomenally fine, and it looks as if this property in the near future would be a very valuable one and a producer of high-grade ore.

THE SYDNEY, under the management of Supt. Gable, is progressing in good shape.

THE GRANITE looks as well as of old and is still the whale of producers.

THE HOPE Co. is as usual pounding away with all their stamps. The superintendent is sanguine of the Silver Chief turning out a rich producer. The company are the pioneers of silver mining in Montana and who erected the first silver-mill in the Territory 20 years since.

DUNKLEBERG DISTRICT, — Reports from Dunkleberg are very encouraging for the future of the carbonate camp. The properties of Drs. Mitchell and Mussigbrod are regular producers and shippers of good grade ore. Dr. Mitchell is most sanguine in regard to what he hopes to be a second Leadville. The Hatta Co. at Dunkleberg is in active operation and developments being pushed.

NEW MEXICO.

ORGAN, — Rio Grande Republican, Sept. 29: Stubenrauch and Cowan will soon make a shipment from the Gray Eagle. Hayden, Davis and Robinson, who have a lease on the Modoc, have opened a cave which is said to be lined with mineral. The Modoc has an immense body of heavy galena ore, which runs well in silver. McCall is working a lease on the Little Buck. He is following a streak of ore in the line which bids fair to open out into a body of high-grade ore, such as has made several leasers a good stake on the same property. Geo. Browne, who is a competent miner, has lately visited the camps of Hermosa, Tierra Blanca and Kingston. He returns satisfied that Organ has the best prospects for a permanent, paying camp that there is in the Territory. Prof. J. C. Carrera has again taken a lease on the Bennett mine. Clark & Brown have run a crosscut on the Ben Nevis, which is in 85 feet. The ledge at this point is 50 feet wide, of a concentrating ore, with rich streaks of smelting ore in several places. The Ben Nevis is one of the most promising properties now developed in the Organs.

PIÑOS ALTOS, — Southwest Sentinel, Oct. 6: Work in an energetic and practical manner is soon to be resumed on the Gold and Silver Ribbon claims located immediately west of and adjoining the Mina Grande, one of the clearest cut fissure veins in the Pinos Altos range. The Osceola, the northernmost extension of the famous Atlantic and Deep Down properties, makes a fine showing at 50 feet in depth. The crevice maintains its usual width, ranging from 6 to 15 inches of milling ore. The Thunderbolt, at 50 feet in depth, is proving to be just what the surface indications promised, namely, the making of a good mine. The Maggie B., on the Atlantic trail, is a new opening of one of the old prospects of the camp. The present owners, Messrs. Bagsby, Ashton & Harkins, are pushing work with commendable zeal.

GEORGETOWN, — Thos. B. Pehy has purchased of Geo. O. Smith the Commercial mine for \$10,000 and the Scottish for \$15,000. The Mimbres Mining Co.'s property at Georgetown, which includes the Naiaid Queen, Glamorgan and several other silver-producing mines and a valuable stamp-mill, was sold at public auction on Saturday under a decree foreclosing a mortgage to Geo. Bliss, Thos. F. Mason and J. D. Hague of New York, for \$51,352.20. Mr. Thos. B. Pehy, who has had charge of this property for four years, will continue to manage it.

COOK'S PEAK, — Thirty men are employed on the Graphic mine at Cook's Peak by Messrs. Hadley & Co. As development progresses the ore increases in value, and it goes without saying that this noted property bids fair to rival some of the famous carbonate mining estates of Leadville.

OREGON.

RICH STRIKES, — Bedrock Democrat, Oct. 6: Word comes from Cable Cove of recent discoveries in quartz made by Don Wickelizer and Wm. Reilly, the richness of which is simply wonderful. A well-defined vein of gold quartz has been uncovered which shows gold in large quantities to the naked eye. The discoverers are recently from Nevada.

THE OUTLOOK, — The outlook of the mines of Cracker creek and of the country adjacent becomes brighter day by day. The mines upon which extensive development work is being done are showing up

in a manner that is truly encouraging, and new discoveries are being made almost daily. New properties that have only until recently been put to the test are coming to the front in a manner that indicates that the wealth of that part of Baker county is just becoming known.

THE GRAY EAGLE, — J. C. Young, one of the owners of the Gray Eagle mine at Cracker creek, came into town Monday evening and brought with him a large quantity of the finest galena and sulphuret ore ever seen in this city. The samples are taken direct from the breast of the tunnel, the ledge being about four feet in width.

CLOSED BY ATTACHMENT, — The Portland Reduction Works have been closed by attachment for several days past. It is thought that the company will soon be reorganized, and if this occurs a much larger plant will be purchased. If the Portland Reduction Works conclude to stand still it is said that a wealthy syndicate stands ready to erect reduction works of sufficient capacity to reduce all the ores that may be sent to that city.

PREPARING FOR WINTER, — Numerous mine-owners of Baker county have visited Baker City the past week to purchase the necessary supplies to carry on work at their properties all winter. From present indications they are a determined set of fellows, and by the coming of another spring enough development work will have been done on many locations to place them on a basis for future extensive operations.

UTAH.

ALTA, — Salt Lake Tribune, Oct. 6: A prominent mining man who visited Alta a few days ago says he was surprised at the favorable outlook there. He found 150 men at work about the various mines. The New Emma, Flagstaff, Windsor group, Buckland Tunnel, Toledo, Emily, Superior, Buffalo Tunnel, City Rocks, Prince of Wales, Revolution, Rough and Ready, and some others are active and some are showing well. The Prince of Wales was spoken of as doing well in the hands of leasers. He says the camp certainly has a good future.

THE SALE OF THE BROOKLYN, — The Tribune has already noticed the sale of the Brooklyn group of mines to the Lead Mining Co., but its importance was not fully shown up. The Brooklyn is one of the best developed mines in Utah, and has paid in dividends over \$200,000, the entire production of metal being over \$1,500,000. It is estimated that the ore on the dump and blocked out in the mine will produce over a quarter of a million more. The Brooklyn lies on the opposite side of a ridge to the Lead group, and over 200 feet higher. This will enable the company to connect the two groups by a tunnel about 1800 feet long. Thus connected, the tramway will be run into the Brooklyn so as to give easy and cheap transit for ore to mill and railway. Surveys for this tunnel are now being made.

CINNABAR, — Utah Union, Oct. 6: The Southern Utah cinabar deposits are showing up well and attracting the attention of mining men.

COPPER, — On Sunday morning a complete copper smelter arrived in Frisco over the Utah Central railway and is being freighted across the San Francisco range of mountains to Copper Gulch, four miles from Frisco. It will there be erected and, it is hoped, will prove a profitable investment to the French syndicate now operating the Comet mine. This property is reported as making a splendid showing of ore in the development work now going on, and the outlook for Frisco is much brighter than it has been for a long time.

WASHINGTON.

WANNACUT LAKE DISTRICT, — Spokane Falls Herald, Sept. 30: W. H. Townsend returned last week from Wannacut lake, where he has been doing the assessment work on the Triune, Jessie, Occident, San Francisco and Silent Friend lodes. They sunk a 20-foot incline shaft on the Jessie and have a three-foot vein of ore carrying chloride of lead, free gold and some silver. On the Triune the shaft will be sunk 100 feet this winter and a crosscut run from the bottom so as to determine the width of the vein. Chas. H. Schepster was the first to discover gold in the Wannacut Lake district. He first went in there in August, 1887, but could not remain long on account of the lack of supplies. He returned to Condonally for the winter and went back in February of this year. During the past summer considerable prospecting has been done and locations made. Next year the assessment work will have to be done on all the claims, when it is expected that many will show up well that are now unknown. Three companies have been organized to work in this district. One with a capital stock of \$500,000 has secured the Magebee, New Hope and Melvina lodes. Another with \$250,000 will develop the Powderly claim. Hall & Dunham have organized a company with offices at La Canas and Portland, called the Wannacut Lake & Aetna Co., with \$50,000 capital stock. They have 12 claims. A three-stamp prospecting mill is now on its way to the district. It will be necessary to place the large mills on the Similkie river, four miles from the mines, so as to secure an abundant water supply.

GOLD DISCOVERY, — Spokane Falls Herald, Sept. 30: A Herald representative learned on last Friday night that what bids fair to be an important gold discovery was made on Old Baldy mountain, several miles northeast of the city. Without making a special visit to the scene of the alleged discovery, it is impossible at this time to tell the extent and value of the find. It appears that Mr. Causey, who is interested in a milk ranch near the fair grounds, was out hunting some time since; while on the southeast side of the mountain named, he and his companion found strong indications of gold-bearing lodes. They returned to the city and provided themselves with the necessary tools, went back to the scene of the find and put in a blast in a favorable-looking spot. This shot threw out quite a quantity of quartz showing free gold. The discovery was kept secret for the time being and friends of the discoverers notified. The result is at present there are 20 claims located in the vicinity of the first discovery. No development work of any consequence has yet been done, so it is impossible to state with any degree of accuracy what the claims will amount to. Mr. Causey states that there is gold in the creek bottom near these leads and that he is of the opinion that placers exist there that will pay well for working.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

SUTTER CREEK.—Amador Ledger, Oct. 6: Drifting in the Wildman mine has been delayed on account of a portion of the shaft needing repairs, which they have been doing the last week. At the Lincoln a drift is to be run from the foot of the hill near the old shaft formerly worked by R. C. Downs. There is a raise of about 100 feet, and if they can strike the ledge at that depth it will give work perhaps for years. H. C. Callahan is up from San Francisco looking after matters pertaining to the Sutter Creek mine. There is a proposition on foot to connect their mill pipe with the Mahoney pipe, which will furnish them with water the year round. They have a very good ledge in sight. The Leggett and Mandich claim, about six miles above here, was sold last week principally to S. D. R. Stewart. The price to be paid is \$10,000. There is to be a ten-stamp mill put upon the claim right away.

AMADOR GOLD MINE.—Ledger, Oct. 6: Preparations for the building of the 60-stamp mill at this mine are making satisfactory headway. F. Mason has secured the contract for building the retaining wall, and is now busy at work on the same. This wall when completed will be 107 feet long, 3 feet thick and 12 feet high. When this wall is finished the work of putting the mill together will be inaugurated. They commenced on the battery-blocks last week. It is expected to have the mill in running order about Christmas. At present there are 30 men employed at the mill and 25 at the mine, besides four teams.

MISCELLANEOUS.—The Gillick mine is still working with promising prospects. Another effort is being made to bond the Doyle mine in Hunt's gulch in the interest of English capitalists.

DRY TOWN.—Cor. Amador Dispatch, Oct. 6: The Overplus mine at Quartz Mountain has resumed work again. Mr. Goodman, the owner, is putting up a five-foot Huntington mill, and will move the Frue concentrators from the Quartz Mountain mill to the Overplus. The ore will pay \$6 to \$8 per ton free gold, and about three-fourths per cent in sulphurets which are worth \$500 to \$600 per ton. The Cosmopolitan is down 500 feet; they will soon sink a shaft; then drifting will be in order about the first of November. The Gover Co. broke ground on its new reservoir on Monday; they will push it with all possible speed so as to get the pipe laid before the rain. In all probability the mine and mill will be run by water from Quartz Mountain by January 1st. The mill is kept running steady of late.

Calaveras.

ACTIVE.—Calaveras Chronicle, Oct. 6: The mining industry is quite active. The Blazing Star has started again and will soon commence to take out ore. The newly-erected 10-stamp mill at the Cook mine commenced crushing rock on the first of the month, but owing to the scarcity of water five stamps only were started. Mr. Schee is the present owner.

WATER SCARCE.—Angels Echo, Oct. 6: The scarcity of water in our section rather retards milling progress to some extent.

GOLDEN EAGLE.—The Golden Eagle mine, situated near Albany Flat, and owned by Messrs. Gerkins and Swartz, is showing up splendidly. Two shafts have been sunk, one to the depth of 40 feet, the other 25 feet. A large vein 12 feet in width shows up well.

El Dorado.

DRIFTING.—Georgetown Gazette, Oct. 4: J. J. Busick of the McCall mine at Gray Eagle Bar, was in town to-day. There are 15 men engaged in drifting.

Los Angeles.

COAL AND IRON.—Newhall Times, Oct. 6: We met Colonel Brophy Saturday, who gave us a few notes on what has been discovered on his ranch about two miles southwest from Newhall. About 14 years ago outcroppings of coal were found, but the lead was not opened up until recently. There were three well-defined veins of coal of 5, 7 and 4 feet thick, and the coal that has been taken out is of a very superior quality. It mines easily, and is of a superior quality, burning to a yellow ash, without any clinkers. The colonel has also discovered five leads of magnetic iron running from 15 to 30 feet thick, and which goes 50 per cent iron. There are two different parties of capitalists who have made overtures to purchase the mine, and it is very probable that it will be sold within a short time.

A GOOD REGION.—Ed. Lyon came down from Ravens Wednesday and brought quite a number of specimens of quartz to be assayed. He says there is quite a mineral region about ten miles southeast of South Side station. He has two claims of gold-bearing rock, one with a well-defined ledge of 6 to 9 feet, and which goes \$20 to \$30 per ton; the rock is free-milling gold, with good traces of silver. It is so easily worked that \$3-ore would pay well. There is plenty of wood and water on the claims, and the cost for working could be figured down to the minimum point. He has a tunnel in 20 feet and a shaft 16 feet, and the ore improves as he gets into it. His other claim has a ledge with an average of two feet and which goes from \$27 to \$30 per ton. Claims of Jones, Green, Botsford and Miller are also in the district, all being worked and all getting out good ore.

Mono.

THE BODIE.—Mono Relief, Oct. 1: Have put in a new pump tank on the 600-foot level and have repaired the 200 and 400 tanks, and the 300 bob and bob pit. Are making as good headway as can be expected in repairing breaks on top.

THE STANDARD CON.—Number of men employed in and about the mine, 20.

THE BULWER CON.—For the past week north drift, 200-foot level, was advanced 16 feet. North drift, 360-foot level, was driven 8 feet.

VITALITY IN LUNDY.—Mono Co. Relief, Oct. 1: On Wednesday Dr. A. B. O'Connor and G. W. Butterfield arrived in Bodie direct from London, England. They left on Wednesday afternoon for Lundy. Dr. O'Connor represents an English syndicate (in which he himself is a large shareholder).

This syndicate has bought up a group of mines at Lundy and incorporated as the Homer District Consolidated Gold Mining Company. There is ample capital behind the company to do all the legitimate mining the managers may see proper. Dr. O'Connor will at once thoroughly investigate his purchase, and if his prospect proves favorable will immediately proceed to open up and develop the entire group of mines, and work them for all they are worth as a legitimate mining proposition. This company is not prospecting for stock jobs. A fair percentage on the money which they propose to invest is all they ask for, all they hope for, all they expect. Every old practical miner knows that the hills at Lundy are full of mineral, and we incline to the belief that inside of a year the Homer District Con. will be taking it out in very respectable quantities. We suspect that Dr. O'Connor will find that he arrives in Lundy at a bad season of the year to do much real work; but he can so arrange and shape his plans during the fall as to be ready to make things hum when spring opens.

Nevada.

SENECA MINE.—Herald, Oct. 6: This mine is located on the mountain-side just south of the Middle Yuba river and directly north of Badger Hill, being about two miles down the river in a direct line from the now famous Delhi. When the ledge was first discovered some of the loose croppings were crushed and yielded \$2.50 per ton. A tunnel was then run in the hillside to strike the ledge at a depth of 100 feet and a crushing was taken out which yielded \$10 per ton in free gold. The company then descended the mountain-side and run a prospect tunnel 150 feet lower down or at a depth sufficient to give 250 feet of backs to stoop out if found to pay. The lower tunnel reached the ledge a few days ago and is being run on the line of the ledge to determine its extent. The ledge thus far in the lower tunnel is over three feet thick, and the rock shows some free gold. The quartz being taken out in running the drift ahead is being hauled to J. Hustler's one-stamp prospect-mill to be crushed to ascertain its richness. The situation of the mine is most favorable for cheap working. An abundance of water with good fall for pressure is easily obtainable and the extraction of ore can all be done through tunnels, so there is no hoisting required.

COLUMBIA HILL.—North San Juan Times, Oct. 5: Geo. Baker and J. A. Jones have been working on the Golconda for the last couple of weeks. At a depth of 20 feet they have struck a 5-foot ledge, which prospects exceedingly well. They are well pleased with their prospect. J. A. Craig is prospecting for gravel near the Eureka Lake Company's sawmill. He has an incline down about 30 feet and expects to strike the gravel within the next 5 or 6 feet. Mr. Craig deserves to strike it rich, as he has done a great deal of prospecting in the last couple of years. The Seneca Co. has a 2-foot ledge, which is said to be rich in free gold; Cherokee has consequently received quite a boom. The El Dorado Co. is still driving their tunnel ahead, but as they have very hard rock it is slow work.

STILL ANOTHER MINE.—Tidings, Oct. 6: Heavy owners in the Powning mine, which adjoins the Coe, say that if the work is resumed on the last-named property by a good company, they will put machinery on their claim and also resume work. As matters stand at present, the water in the Coe would have to be handled by the Powning Co.

Placer.

SALE OF THE HATHAWAY MINE.—Placer Herald, Oct. 6: James Butts has sold the Hathaway mine, near Ophir, to Valentine Bros. of San Francisco for \$12,000. This is a valuable quartz mine. The vein is about 4 feet thick, and the pay chute is 1000 feet long at the depth of 180 feet. The rock pays from \$10 to \$12 per ton, free milling. The sulphurets average about three per cent. This ledge is supposed to be the monster lode of the Ophir mining district. Valentine Brothers will at once put up hoisting works, and will sink the shaft to the depth of 500 feet. They will also complete a 10-stamp mill. The new managers expect to produce gold bars within 90 days. The mill will be run by water-power. Geo. Horn, the manager of the Valentine mines in this State, will take charge of the mine.

FOREST HILL DIVIDE.—Placer Herald, Oct. 6: Very little work is doing at Yankee Jims in the mines. Welker & Kennedy are running drifts in their Georgia Hill mine preparatory to the systematic working of the mine. Charles Trafton is running his tunnel ahead into the same hill, and enlarging it. Georgia Hill has yielded an immense amount of gold, having paid from the grass down to the bedrock. There is no doubt of the existence of a back channel, which will yield a rich harvest whenever it shall be struck by the lucky prospector. At the Gray Eagle mine, Mr. Durning is busy erecting new hoisting works. The shaft is down to bedrock and is over 350 feet in depth, and the old hoisting works are not strong enough to do the work. The Dardanelles is paying richer than ever. The gold is coarse and heavy and plentiful, and is exactly like that in the rich Mayflower channel. The gravel is also of the same character as that of the Mayflower. The mill is running night and day, and works to perfection. All the works are now under roof. The work is going along satisfactorily under the skillful management of Supt. W. H. Grinnel. The mine is dry and well ventilated, and is a very comfortable place for the men to work in. Gen. Hamilton employs about 60 men, and is enjoying a revenue of several hundred dollars a day over and above running expenses. Supt. Chappellet is pushing the work at the Mayflower. The tunnel, on Sept. 30th, was in 5503 feet. At this point they have begun an upraise and will doubtless be in the channel before this item appears in print, as they expect to run 20 feet only. As soon as gravel is struck and drifts are run and other preparatory work is done, a large force of men will be put on, and we can expect to hear of wonderful developments. This mine is the richest on the divide, having yielded \$193,000 in eight months, and when, owing to the difficulty of handling the water, the bedrock was not cleaned or creviced; but now the tunnel will drain the entire mine. At present there are 32 men at work in the hoisting works and tunnel. Twenty-seven men are working at the new mill at the mouth of the tunnel. This mill is a mammoth one, and will contain 20 stamps. It will be worked by steam and water-power. Mr. Chappellet expects to have the mill finished by the 10th of November. At the Live Oak some five men are at work running a drift

from the upraise which connects the tunnel with the upper lead. This upraise begins at a point 1800 feet from the mouth of the tunnel and is 65 feet in length. The drift will connect the Nauatauck ground with the Live Oak. This drift will be 50 feet in length and is in gravel ten feet in thickness. This gravel prospects very well, and is expected to pay well when the ground has been put in proper shape for working. The gold is fine. Supt. Dodge is extending the second upraise in the Baker District tunnel, and intends to drift from it in a direction parallel with the course of the tunnel. Mr. Dodge employs ten men. J. C. Scott has men at work on his mine on Volcano canyon. He is preparing to open up his claim there. The Breese & Wheeler claim gives employment to 25 men. The breast is 60 feet in width, but the yield this month is not so large as it was the preceding month.

Plumas.

A RICH STRIKE IN THE DRURY.—Greenville Bulletin, Sept. 30: A very rich strike was made in the Drury mine. Mr. Drury has been driving the middle tunnel ahead. On one side of the main lode is a vein of quartz and dirt which is the richest we have ever seen. Out of two pans of dirt and quartz \$30 was obtained by washing merely. As much more is in quartz therefrom.

THE PLUMAS EUREKA MINE continues its operations with the usual regularity and success. John Hosking is superintendent, T. B. Inch, clerk and head accountant, and Wm. F. Johns assayer. There are over 200 men on the pay roll, most of them from Cornwall. It is the policy of the management to employ only men of sobriety. The greater part of the ore is taken out through the lower tunnel. The 40-stamp mill is one of the best equipped in the country. The corporation has its own assay office, over which Wm. F. Johns presides.

Shasta.

AT OLD DIGGINGS.—Redding Free Press: Superintendent Morton of the Josephine and Providence mines at Old Diggings, recently purchased by Walker Bros. of Salt Lake, came up from Greenwood this week with a number of experienced miners and has started the development of these excellent properties in a business-like manner. A 20-stamp mill arrived this week for the Union Consolidated mine. The proprietors, Murray Bros., have also purchased a rock-breaker from Bell Bros.

Sierra.

OXFORD.—Mountain Messenger, Oct. 6: The Oxford Mining Co. (Old Gold Hop-) have struck porphyry in their tunnel. It is considered that they are not far from the ledge, as its northern wall, in the tunnel above, was porphyry. A force of men is at work at the Marguerite mine getting the mine in condition to work after its being shut down for several years. The water ditch belonging to the Dutch company has been leased, and a refusal of its purchase for \$5000 has been secured. The Buffalo Quartz Mining Co. of Hog Canyon have, within the past week, completed arrangements for building a new mill on their claim and now have about 20 men at work grading a millsite and doing other preparatory work.

THE BUFFALO.—Sierra Tribune, Oct. 6: The owners of the Buffalo mine have concluded arrangements to erect a mill at their mine. Ernest Busch, who has been at San Francisco for the past few weeks, telegraphed up that he had purchased the ten-stamp plant at the Columbo mine, and another telegram was received by those who have in charge the latter property to turn the mill over to the Buffalo Co. Van Slyke's sawmill at Butcher Ranch has already started in to get out the necessary lumber for the mill, boarding-house and blacksmith shop. It is proposed to push the work along with all possible speed so as to have the mill in running order before snow flies. The mine is in splendid condition.

A RICH STRIKE.—In the lower tunnel of the Glidden mine, Gold Valley, this week there was encountered a vein which measures from two to three feet in width, which shows up very rich in free gold. This tunnel is in the hill about 80 feet, and 200 feet in depth from the surface. The Glidden mine promises to become a bonanza to its owners, who are Mat Willoughby, William Jones, O. B. Dolley, and F. L. Glidden. Ed Lawrence and Jack Branden visited the San Luis mine day before yesterday. The tunnel is in 397 feet. The rock is getting softer and the indications are that the ledge is in close proximity. Thos. Murphy is prospecting a quartz ledge above the Chipp mine. The outlook for a mine there is considered quite favorable.

NEVADA.

Washoe District.

UNION CON. AND MEXICAN.—Virginia Enterprise, Oct. 6: The joint Union and Mexican north drift, started from the Ophir shaft on the 1455 level, has been extended 60 feet; total length, 410 feet.

CON. CAL. & VIRGINIA.—The south drift on the 1435 level is in vein material, giving low assays. The stipes east of the winze on this level continue to look and yield well. On the 1500 level the stipes on the southeast drift yield well. On the 1600 level ore is still being yielded by the stipes south of the Ophir line and 36 feet above the track floor. The stipes on the south drift and winze are showing much good ore. The usual amount of ore has been shipped to the mills and the assays average about as last week.

GOULD & CURRY.—On the 200 level east crosscut from the top upraise from the 300 level (or El Dorado level) has been extended 20 feet; total length, 77 feet. The formation is low-grade ore. The west crosscut started from the top of the same upraise has been advanced 32 feet. The formation is quartz giving low assays.

OCCIDENTAL.—Have completed repairs on the chute in the north incline winze. Extracted 140 tons of ore; shipped to the Atlanta mill 137½ tons. Average assay value, by wagon samples, \$25. Bullion shipped to San Francisco office, total yield from the Atlanta mill for September account, assay value, \$5657.77.

CROWN POINT.—The main south drift on the 700 level is again being pushed ahead. It is passing into ground of a promising appearance. The Suto tunnel drift is making good progress and will be connected in a short time.

BALTIMORE.—Are still operating on the 338 level. The machinery is working well, and there is

no trouble to handle all the water that comes in. The company will soon begin crushing ore at their own mill on the ground.

HALE & NORCROSS.—The drift west from the new 800 station is out 96 feet. The connections made will not only be of great advantage in working the mine, but will materially improve the ventilation.

IMPERIAL GROUP.—The Con. Imperial, Challenge Con. and Confidence mines are still closed down pending the repairs of the hoisting works at the Yellow Jacket shaft, through which they are all worked.

BEST & BELCHER.—On the 300, or El Dorado level, west crosscut No. 1 from the main northwest drift, has been extended 22 feet; total length, 258 feet. The formation is porphyry.

SIERRA NEVADA.—East crosscut No. 3 from the main south drift has been extended 50 feet; total length, 556 feet. It continues in porphyry filled with seams of clay.

ALPHA AND EXCHEQUER.—East crosscut on the 382 level of Exchequer is out 157 feet. The east drift in Alta is out from the old shaft 165 feet.

CHOLLAR.—The drift west from the 350 station has been extended 40 feet; total, 120 feet. The face of the drift is in clay and porphyry.

JUSTICE.—The work at the new mill is progressing well. Are steadily hoisting ore from the different reserves in the mine.

SAVAGE.—A good deal of work has been done on the several levels in the way of repairing and easing up timbers.

SEG. BELCHER.—Work confined to south upraise, where good progress is being made in a favorable formation.

ALTA.—Are engaged in making repairs to the main shaft and to the hoisting-works building.

LADY WASHINGTON.—Are making good headway in the raise above the 725 level.

YELLOW JACKET.—A good deal of repair work of various kinds is in progress.

KEYSTONE.—Good headway is being made in sinking the main incline.

Bristol District.

COPPER FURNACE.—Pioche Record, Oct. 6: The Roe Bros.' copper furnace at Bristol has been running for about 10 days. Fourteen tons of bullion were shipped to Milford last Tuesday. About 16 tons more will be produced, when a stop will be made. The present price of copper makes the business profitable, and we hope the boys will gather in a few thousands of the fortune which Bristol District certainly owes them.

Cottonwood District.

NICKEL.—Cottonwood has had hoisting works erected, and the nickel and cobalt increases in richness as depth is attained.

ALASKA.

ADVANCING.—Free Press, Sept. 29: Although Alaska has experienced no great boom this season, the country has nevertheless advanced very rapidly; a number of large mining surveys were made, which are the foundations for the near erection of a number of large stamp-mills, and a large amount of development on mining property has been done. The Treadwell mine has been a steady producer, the placer mines in the Basin have yielded well in gold dust, and late reports from the Yukon would indicate that the section will pan out this season in excess of last, not owing to any new discoveries being made, but to the increased number of men that have been mining there. When all reports come in this fall from both the Yukon and Copper river regions and from Cook's inlet, we confidently expect to hear of a number of rich discoveries as the result of the past season's prospecting.

COAL.—Although a number of men have devoted this summer to prospecting for coal in this near vicinity, nothing has yet been struck. Prospectors should bear in mind that around here the formation is not coal bearing. There is a sandstone belt to the north and one to the south, in which good coal veins might be found.

RICH ORE.—Andy Anderson now has a ton of \$500 ore packed down from the mine to his camp on Sheep creek, and siwasbes are now packing it down to the beach; it will be shipped below on the Ancon. Andy, working alone, takes out about 125 pounds ore daily, making two trips daily packing it down to camp. Specimens of ore from this vein will run 2000 ounces silver and from \$50 to \$200 in gold per ton.

ARIZONA.

WALKER DISTRICT.—Prescott Courier, Oct. 1: J. N. Rodenburg has come in from Walker district. From him we get the following items: He has built a house and is going to put men at work in his Berlin mine. N. L. Griffin and Fred Sable are sacking ore from the Fortune mine. Frank Kuhne will shortly ship two carloads of ore from the Belle mine. The Amulet is yielding lots of rich ore. John King is getting ore that will work \$800 to the ton. Mike Chandler is making from \$4 to \$5 a day in his placer claim. The district will poll about 60 votes. Harlan & Barrington, owners of the Howard mine, were at the Bank of Arizona Saturday last with over 400 ounces of gold product of five tons of rock. The "har" is worth nearly \$7000. Water is increasing and they will soon run the mill ten hours each day. G. K. W. McNary has just located two very rich ledges in Copper basin. Ore is rich in silver. Walter Murphy of Jerome says two cars a day of silver-copper bullion are being shipped East. Van Name's mill is crushing rich rock. N. L. Griffin, a pioneer miner of Walker district, has brought in a shipment of ore. A. J. Park says miners are prosperous in Hassayampa district. John Dawson and John Taylor have finished assessment work on the Gray Eagle, Bradshaw district. E. L. Gobin, miner and millman, says times are improving in Peck district.

THE WATERVALE.—Tombstone Epitaph, Oct. 1: From Superintendent Coffman, of the Watervale Mining Co., it is learned that the double compartment shaft, now being sunk in the Bunker Hill, is down 335 feet. Three shifts are running and work never ceases. The large double engine, now in construction in Chicago, will be finished and shipped

about the middle of October. Shipping receipts have been received by Mr. Coffman for 20 tons of material now on the way, including boilers, ore-cars and other machinery. The capacity of the new hoist is not exactly known, but it is sufficient for a depth far below the water level. The Rattlesnake, Mammoth, Bunker Hill and other properties of the Waterville Co. are rapidly developing under the able management of Mr. Coffman into bonanzas.

MOHAVE.—*Miner*, Oct. 6: There are 60 tons of ore from the C. O. D. on the ore platform at the sampling works ready for working. The Lone Star, at Mineral Park, is producing better ore than ever before. The ore streak is six inches wide, but very rich. It is rumored that a ten-stamp mill will soon be erected on Stockton Hill, and that Prescott parties are interested in the matter. Supt. Campbell of the Flores brought in Tuesday a bar of bullion valued at \$1500. The recent strikes in the Flores are developing finely, and the ledge is widening and increasing in richness. E. F. Thompson this week sold the Vanderbilt mine at Cerbat to a Philadelphia syndicate for \$10,000. Since the first of the year two miners have taken about \$7000 out of this mine, and it is considered one of the best properties at Cerbat.

AROUND PRESCOTT.—*Journal-Miner*, Oct. 6: Col. Bigelow has six tons of ore on the dump ready for shipment, and expects to complete a load this week. Work is being pushed on the smelter for the Copper Basin Copper Co. Work will be commenced again soon on the Perry mine, a property which has yielded several thousand dollars in gold ore. The United Verde Copper Co., a few days since, started up another 30-ton smelter, having two in operation now. Nearly two carloads of ore arrived at the sampling works yesterday from Congress mine, and the above institution is crowded at present. Charles A. Girdler and Dr. Vickers have been experimenting to-day with the treatment of sulphuret ore from the Congress mine, by means of electricity. Walter Wright continues to run the Del Pasco mill with good success as water can be obtained. He has an abundance of ore, but water is scarce. Freighters are engaged in moving a smelter to the Hillside mine, and the owners of that property expect to commence smelting their ores soon at the mine. The Crowned King continue to run their pack train getting ore to the mill, so as to be ready for a continued run when the water becomes plentiful, which is at present very scarce. A deed has been filed for record from John Lawler and Jules Baumann, for the Lawrence and Manzanita mining claims, Agua Fria district, the price named being \$10,000. Geo. W. Sines returned yesterday from a trip through the Hassayampa mining district. He says the new shaft in the Senator is down to a depth of 100 feet, and is in good ore at the bottom. Messrs. Harlan and Barrington, of the Howard mine, brought in another bar of gold bullion to-day, weighing 402 ounces, a total value of \$6834. This bar was the result of a run of five tons of ore from the mine. The property is not yet opened up to any great extent, but has yielded some \$20,000 or \$30,000, and has several hundred tons of ore in sight. J. M. W. Moore, of the Prescott sampling works, reports the largest receipts of ore yesterday, at those works, of any single day since they were started, amounting to over 40,000 pounds, or more than two carloads. Of this, 23,000 pounds were from the Congress, the remainder being from Lynx creek and Hassayampa districts. Captain A. T. Brann has just returned from a trip through the Bradshaw country, and reports the greatest activity there. W. B. Long, superintendent of the Ora Bella, has about 75 men employed in the mines and building roads.

COLORADO.

LEADVILLE NEWS.—*Denver Tribune-Republican*, Oct. 6: The Castle View mine on Carbonate hill was leased a few weeks ago by the Castle View Mining Co. to Captain Eben Smith. To open and drain the property a long shaft is being driven from the Henriette and Maid workings through the Big Chief to the Castle View. When drained, the Castle View will be worked through its own shaft. This is one of the most important enterprises in progress in Leadville at the present time, as it will make two more producing mines. The Big Chief, which has ore but has been much troubled by water, will commence shipping, and likewise the Castle View. The latter mine has been idle for some months on account of trouble in the company. The body of pyrite ore which was discovered some weeks ago in the Moyer, by a drift in the ore chute east of the shaft, is proving to be a very fair channel of good ore in the midst of the great body of low-grade sulphide ore. The Colonel Sellers mine is doing as well as usual, and in September will make its first monthly output of about \$50,000. The Glass-Pendery has started work again with its new plant of machinery. The shaft is being sunk at the rate of from 3 to 4 feet per day. Mr. H. B. Slater has returned from an extended business and pleasure trip through the East. While in Washington he secured the patents for his new process of treating blendeous silver ores. Experiments with the process are now being made in Denver. If these experiments are successful, as they are likely to be, it is more than probable that a plant of 200 tons per day capacity will be erected in Leadville by the Iron Silver Co. for the purpose of treating the low-grade sulphide ore of the Moyer mine before the winter sets in. Some ore was struck unexpectedly in the Virginus on Wednesday. A raise is being made through the flint to open a new stop in the body of iron ore overlying. In the flint the raise cut a body of lead carbonate ore two feet thick. The ore was of excellent grade, assaying 55 per cent lead and about 40 ounces silver.

IDAHO.

SHEEP MOUNTAIN.—*Ketchum Keystone*, Oct. 1: Numerous parties have of late arrived in Ketchum from the Sheep Mountain and Seaford districts for the purpose of marketing ores, shipping in fall supplies, etc., and nothing but the very best of reports reach us in regard to the outlook in that country. It is a fact beyond doubt that a number of mines there have large quantities of rich ore on the dump which is held simply in anticipation of better freight and reduction facilities. The mine-owners there unite in the statement that there is sufficient ore of desirable character in sight to warrant the establishment of smelters of moderate capacity, which, it is

the universal opinion, could hardly fail of success in the treatment of custom ores. The reported richness of mines in that region is corroborated by every miner who has been there. Most of the miners will, however, come out for the winter season, and we learn the store and bar in the camp of Seaford have already been closed.

THE TISHINGALE, owned by Mr. Harland, is one of the richest locations in the district. It is developed by several cuts on the ledge and one tunnel 22 feet in length, in which the ore is in place and continuous, showing several feet of very high-grade ore, and about ten inches that will assay in the neighborhood of 1000 ounces. There is a vast amount of ore in that country that is deceiving in character, much of which may prove to be very valuable. The formation is granite and lime with an occasional porphyry dyke. The ores are chiefly "dry," carrying less than 20 per cent lead, traces of gold and large quantities of silver.

PLACER DIGGINGS.—Kee Levah, a well-known China laundryman of this place, returned from Smoky a few days since with 15 ounces of gold dust, the result of four Chinamen's work for 30 days on a new prospect in that district. The ground is extensive and easily worked, the bedrock being but seven feet from the surface, but the ground thus far has not produced over \$2 a day to the man.

YREKA DISTRICT.—*Wardner News*, Sept. 29: The owners of the Emma and Last Chance mines have every reason to feel proud of the development of their property. The Last Chance is proving a veritable bonanza, and when the same amount of work has been done on the Emma, similar results may be expected. The Spokane Company's concentrator at the foot of the mountain is now in thorough working order and is kept running uninterruptedly.

ELK CREEK.—O. A. Brown, the original discoverer of the Elk creek gold mines, sold on Thursday all his interest in that property to Messrs. J. F. Wardner and B. Goldsmith.

LALANDE DISTRICT.—Nothing new can be said about the Poorioan mine at Burke beyond the fact that increased development but adds additional proof of the vast resources of the property, and the new concentrator is working to a claim. Supt. Clark says: Out of 100 to 120 tons of second-class ore, it produces 25 to 30 tons concentrates, which assay 65 per cent lead and 40 ounces silver.

DIAMOND HITCH.—Supt. B. B. Jones is more than pleased with the result of his labor on the Diamond Hitch mine. During the week the property was visited by Prof. Price of San Francisco, who expressed himself in unqualified praise of the good showing made in the mine, and says he has every confidence in its becoming a great ore-producer.

EAGLE DISTRICT.—The ditch being built by Syd Mills to convey water from East Eagle creek to Fancy gulch is nearing completion, four miles of the work being now finished.

CEUR D'ALENE DISTRICT.—The owners of the Mother lode made a rich strike last week in their middle tunnel by exposing a body of ore from 3 to 4 feet in width, bearing plenty of free gold. The tunnel is in 160 feet and development work continues day and night. Scarcity of water compels the necessity of working the adrastra only occasionally.

MONTANA.

GERMAN GULCH.—*Inter-Mountain*, Oct. 1: Dr. G. W. Beal came in from his placer mine in German gulch to-day and speaks in glowing terms of the favorable outlook for the new camp at the junction of German and Blacktail gulches. He reports some valuable lead discoveries being made there and a great deal of work in progress. The Anaconda Co. purchased a half interest in Thomas Newcomb's properties last week, from the good showing made in the Newcomb lode, which is down 40 feet.

THE LOWLANDS.—*Inter-Mountain*, Oct. 1: At the Butte City Sampling Works there was received on Wednesday a quantity of ore from the Amazon mine, in the Lowlands, which was assayed, and the result was \$400 in silver and 20 ounces in gold. This is about the richest quartz that has ever been brought to Butte, and the owners say that they have plenty of it in the Amazon mine.

THE RUBY MINE.—It was reported on the streets yesterday that another pocket of wonderful richness has been discovered in the Ruby mine, in the same district. Since the Anaconda Co. left the mine the owners have been at work and opened up this new find. It is said that the gold runs like wire through the rock and by breaking a piece of ore the yellow metal hangs together in threads. The proprietors of the Ruby express themselves as pleased that the Anaconda Co. did not take up the bond of \$200,000 on the mine.

CASTLE MOUNTAIN MINES.—*Butte Inter-Mountain*, Oct. 1: The great strike of the season has just been made by Ben Johnson and John Davis at the head of Thompson's gulch, about 15 miles west of White Sulphur Springs. This consists of a six-foot vein of gold ore that yields two or three cents per pound to both the lead matter and the regular ore from wall to wall. Mr. Johnson is of the opinion the ground will also pay for working for placer gold. This lead is believed to be the source from which the rich deposits of Thompson gulch came. There has been a big strike made recently in the Grasshopper lead, situated about six miles east of town. The rich body of ore was found about two weeks since, but the matter has been kept dark. The find consists of a four-foot vein of solid ore that runs in the hundreds. About six inches of this is very rich and assays 1200 ounces in silver. Several undeveloped properties in the vicinity of the Alice and Judge mines have recently been sold to capitalists. Such prospects rate at about \$500 each.

THE ALICE MINE.—The ore from the Alice mine is worth \$110 in silver and lead. It costs \$15 per ton to haul it to Toston, \$35 to treat besides, or 10 per cent, leaving a net income of \$40 per ton for mining. The mine is now developed to a depth of 100 feet, and a force of men has been set to work stopping. It is estimated that it will require three months to take out the ore in sight.

DEWEY'S FLAT.—*Inter-Mountain*, Oct. 2: The most profitable mine now in operation in this vicinity is the Looe Pine, owned and operated by the Partridge Bros. Their plant is on the Big Hole riv-

er, two miles below Dewey's Flat. Their power is a turbine wheel. The mine is on Quartz hill nearly 10 miles from their mill. During the first years of their ownership the mine did not prove very profitable. Only fair wages were made and nothing more. But for the last two seasons it has been improving very rapidly, running up from less than 20 ounces to an average of nearly 60 ounces per ton. During this time they have followed the ledge down some 300 feet. The Partridge Bros. are the only ones who have made a success of the Jones pulverizer of Portland, Or. They seem to experience no difficulty in regularly crushing about five tons when they have water to run all day. They amalgamate by the barrel process and save up to a high percentage that way. Allen Hay is steadily running his little mill at the Flat and is crushing ore from the old Quartz hill mine. This property is also improving in size and value as they attain depth, and from present appearances would amply repay the erection of a large mill. Quite a large amount of prospecting is now going on between Quartz hill and the Vipond district. About 20 men are engaged on different locations there.

PHILLIPSBURG DISTRICT.—*Butte Miner*, Sept. 29: H. K. Fairgrieve of Phillipsburg, M. T., reports the burg to be exceedingly active. Both the Granite and Bi-metallic mills are pushing their building operations. Superintendent Risque of the Bi-Metallic Co. has his company's mill on Douglas creek almost under cover. Much of the machinery is on the ground. Their mine is in most excellent condition, with enough ore on the dump to keep the new 50 stamps in constant operation for months.

SAN FRANCISCO.—Superintendent Eugene Smith reports this mine in most favorable condition. The east 400 is looking exceedingly well. This company has purchased a millsite just west of town and expects to break ground for reduction works early in the coming season.

THE PEARL MINE is looking phenomenally fine, and it looks as if this property in the near future would be a very valuable one and a producer of high-grade ore.

THE SYDNEY, under the management of Supt. Gable, is progressing in good shape.

THE GRANITE looks as well as of old and is still the whale of producers.

THE HOPE CO. is as usual pounding away with all their stamps. The superintendent is sanguine of the Silver Chief turning out a rich producer. The company are the pioneers of silver mining in Montana and who erected the first silver-mill in the Territory 20 years since.

DUNKLEBERG DISTRICT.—Reports from Dunkleberg are very encouraging for the future of the carbonate camp. The properties of Drs. Mitchell and Mussigbrod are regular producers and shippers of good grade ore. Dr. Mitchell is most sanguine in regard to what he hopes to be a second Leadville. The Hatta Co. at Dunkleberg is in active operation and developments being pushed.

NEW MEXICO.

ORGAN.—*Rio Grande Republican*, Sept. 29: Stubenrauch and Cowan will soon make a shipment from the Gray Eagle. Hayden, Davis and Robinson, who have a lease on the Modoc, have opened a cave which is said to be lined with mineral. The Modoc has an immense body of heavy galena ore, which runs well in silver. McCall is working a lease on the Little Buck. He is following a streak of ore to the line which bids fair to open out into a body of high-grade ore, such as has made several leases a good stake on the same property. Geo. Browne, who is a competent miner, has lately visited the camps of Hermosa, Tierra Blanca and Kingston. He returns satisfied that Organ has the best prospects for a permanent, paying camp that there is in the Territory. Prof. J. C. Carrera has again taken a lease on the Bennett mine. Clark & Brown have run a crosscut on the Ben Nevis, which is in 85 feet. The ledge at this point is 50 feet wide, of a concentrating ore, with rich streaks of smelting ore in several places. The Ben Nevis is one of the most promising properties now developed in the Organs.

PIÑOS ALTOS.—*Southwest Sentinel*, Oct. 6: Work in an energetic and practical manner is soon to be resumed on the Gold and Silver Ribbon claims located immediately west of and adjoining the Mina Grande, one of the clearest and most fissure veins in the Pinos Altos range. The Osceola, the northernmost extension of the famous Atlantic and Deep Dowe properties, makes a fine showing at 50 feet in depth. The crevice maintains its usual width, ranging from 6 to 15 inches of milling ore. The Thunderbolt, at 50 feet in depth, is proving to be just what the surface indications promised, namely, the making of a good mine. The Maggie B., on the Atlantic trail, is a new opening of one of the old prospects of the camp. The present owners, Messrs. Bagshy, Ashton & Harkins, are pushing work with commendable zeal.

GEORGETOWN.—Thos. B. Pheby has purchased of Geo. O. Smith the Commercial mine for \$10,000 and the Scottish for \$15,000. The Mimbres Mining Co.'s property at Georgetown, which includes the Naiad Queen, Glamorgan and several other silver-producing mines and a valuable stamp-mill, was sold at public auction on Saturday under a decree foreclosing a mortgage to Geo. Bliss, Thos. F. Mason and J. D. Hague of New York, for \$51,352.20. Mr. Thos. B. Pheby, who has had charge of this property for four years, will continue to manage it.

COOK'S PEAK.—Thirty men are employed on the Graphic mine at Cook's Peak by Messrs. Hadley & Co. As development progresses the ore increases in value, and it goes without saying that this noted property bids fair to rival some of the famous carbonate mining estates of Leadville.

OREGON.

RICH STRIKES.—*Bedrock Democrat*, Oct. 6: Word comes from Cable Cove of recent discoveries in quartz made by Doo Wickeizer and Wm. Reilly, the richness of which was wonderfully. A well-defined vein of gold quartz has been uncovered which shows gold in large quantities to the naked eye. The discoverers are recently from Nevada.

THE OUTLOOK.—The outlook of the mines of Cracker creek and of the country adjacent becomes brighter day by day. The mines upon which extensive development work is being done are showing up

in a manner that is truly encouraging, and new discoveries are being made almost daily. New properties that have only until recently been put to the test are coming to the front in a manner that indicates that the wealth of that part of Baker county is just becoming known.

THE GRAY EAGLE.—J. C. Young, one of the owners of the Gray Eagle mine at Cracker creek, came into town Monday evening and brought with him a large quantity of the finest galena and sulphuret ore ever seen in this city. The samples are taken direct from the breast of the tunnel, the ledge being about four feet in width.

CLOSED BY ATTACHMENT.—The Portland Reduction Works have been closed by attachment for several days past. It is thought that the company will soon be reorganized, and if this occurs a much larger plant will be purchased. If the Portland Reduction Works conclude to stand still it is said that a wealthy syndicate stands ready to erect reduction works of sufficient capacity to reduce all the ores that may be sent to that city.

PREPARING FOR WINTER.—Numerous mine-owners of Baker county have visited Baker City the past week to purchase the necessary supplies to carry on work at their properties all winter. From present indications they are a determined set of fellows, and by the coming of another spring enough development work will have been done on many locations to place them on a basis for future extensive operations.

UTAH.

ALTA.—*Salt Lake Tribune*, Oct. 6: A prominent mining man who visited Alta a few days ago says he was surprised at the favorable outlook there. He found 150 men at work about the various mines. The New Emma, Flagstaff, Windsor group, Buckland Tunnel, Toledo, Emily, Superior, Buffalo Tunnel, City Rocks, Prince of Wales, Revolution, Rough and Ready, and some others are active and some are showing well. The Prince of Wales was spoken of as doing well in the hands of leasers. He says the camp certainly has a good future.

THE SALE OF THE BROOKLYN.—*The Tribune* has already noticed the sale of the Brooklyn group of mines to the Lead Mining Co., but its importance was not fully shown up. The Brooklyn is one of the best developed mines in Utah, and has paid in dividends over \$200,000, the entire production of metal being over \$1,500,000. It is estimated that the ore on the dump and blocked out in the mine will produce over a quarter of a million more. The Brooklyn lies on the opposite side of a ridge to the Lead group, and over 200 feet higher. This will enable the company to connect the two groups by a tunnel about 1800 feet long. Thus connected, the tramway will be run into the Brooklyn so as to give easy and cheap transit for ore to mill and railway. Surveys for this tunnel are now being made.

CINNABAR.—*Utah Union*, Oct. 6: The Southern Utah cinnabar deposits are showing up well and attracting the attention of mining men.

COPPER.—On Sunday morning a complete copper smelter arrived in Frisco over the Utah Central railway and is being freighted across the San Francisco range of mountains to Copper Gulch, four miles from Frisco. It will there be erected and, it is hoped, will prove a profitable investment to the French syndicate now operating the Comet mine. This property is reported as making a splendid showing of ore in the development work now going on, and the outlook for Frisco is much brighter than it has been for a long time.

WASHINGTON.

WANNACUT LAKE DISTRICT.—*Spokane Falls Herald*, Sept. 30: W. H. Townsend returned last week from Wannacut lake, where he has been doing the assessment work on the Triune, Jessie, Occident, San Francisco and Silent Friedo lodes. They sunk a 20-foot incline shaft on the Jessie and have a three-foot vein of ore carrying chloride of lead, free gold and some silver. On the Triune the shaft will be sunk 100 feet this winter and a crosscut run from the bottom so as to determine the width of the vein. Chas. H. Schepstuer was the first to discover gold in the Wannacut Lake district. He first went to there in August, 1887, but could not remain long on account of the lack of supplies. He returned to Condonally for the winter and went back in February of this year. During the past summer considerable prospecting has been done and locations made. Next year the assessment work will have to be done on all the claims, when it is expected that many will show up well that are now unknown. Three companies have been organized to work in this district. One with a capital stock of \$500,000 has secured the Magebee, New Hope and Melvina lodes. Another with \$250,000 will develop the Powderly claim. Hall & Duham have organized a company with offices at La Canas and Portland, called the Wannacut Lake & Aetna Co., with \$50,000 capital stock. They have 12 claims. A three-stamp prospecting mill is now on its way to the district. It will be necessary to place the large mills on the Similkieen river, four miles from the mines, so as to secure an abundant water supply.

GOLD DISCOVERY.—*Spokane Falls Herald*, Sept. 30: A *Herald* representative learned on last Friday night that what bids fair to be an important gold discovery was made on Old Baldy mountain, several miles northeast of the city. Without making a special visit to the scene of the alleged discovery, it is impossible at this time to tell the extent and value of the find. It appears that Mr. Causey, who is interested in a milk ranch near the fair grounds, was out hunting some time since; while on the southeast side of the mountain named, he and his companion found strong indications of gold-bearing lodes. They returned to the city and provided themselves with the necessary tools, went back to the scene of the find and put in a blast in a favorable-looking spot. This shot threw out quite a quantity of quartz showing free gold. The discovery was kept secret for the time being and friends of the discoverers notified. The result is at present there are 20 claims located in the vicinity of the first discovery. No development work of any consequence has yet been done, so it is impossible to state with any degree of accuracy what the claims will amount to. Mr. Causey states that there is gold in the creek bottom near these leads and that he is of the opinion that placers exist there that will pay well for working.

MECHANICAL PROGRESS.

A Simple Way to Detect the Quality of Iron.

Much may be done in determining the character of iron by etching tests, which may be readily made in the following manner: Take a piece of polished iron or steel and immerse it in an acid solution. Let it remain there until the etching effect has proceeded to the desirable extent, which varies according to the grade and quality of the metal. When sufficiently etched, withdraw and cleanse the sample from the acid and thoroughly dry it. If, now, we take the etched sample and apply a thin film of printer's ink to its surface, a print can be taken from it upon paper in the same manner as from an engraved plate. The picture so made reproduces accurately the differences shown in the etched surface, and from it can be drawn various conclusions in regard to the character or value of the metal from which the sample was taken for the uses for which it was intended.

To make an etching acid, mix one ounce of sulphate of copper, one-fourth of one ounce of alum, and one-half teaspoonful of salt reduced to powder, with one gill of vinegar and 20 drops of nitric acid. This liquid may be used either for etching deeply into the metal or for imparting a beautiful frosted appearance to the surface, according to the time it is allowed to act.

Those who have never seen the class of prints in question have no idea of the beauty or delicacy of tint that they show, or how clearly various characteristics in regard to the structure, quality and workmanship of the metals tested are exhibited. The prints thus taken are inscribed with the necessary information as to the metal tested, its previous or intended service, etc., and all these filed for future reference, taking but little room. Their record is so complete that as a rule there is no necessity for keeping the samples from which they are made.

It is stated by those who have become experienced in making such tests that such etchings throw more light upon the structure of metals where failure has occurred, as in the case of broken axles, than the method often used of making photographs of the fracture of the point of failure, or of a broken sample. The lights and shades on an uneven surface of metal, as shown at a fracture, may often prevent the gaining of a clear conception, from a photograph, of the character of the metal, or of the part its physical characteristics played in bringing about the failure in question.

When iron rails were in use, this system of etching was especially valuable, though it really came into play but a short time before the manufacture of iron rails in this country had virtually come to an end, owing to the cheapness at which steel rails could be turned out. The head and web of the rail generally being of different metals, it was important to know whether the head was composed of a fine-grained homogeneous metal, and whether the weld between the two qualities of iron used was a perfect one. The latter point was shown in a remarkable clear manner by the etching process, and the discovery of imperfect workmanship from this cause has probably saved large sums of money in the past. The etching of rails was especially valuable in the case of "re-rolled" rails, when a certain amount of new metal was to be used in making the head. The impression from an etched section showed without chance of dispute whether the specifications were being lived up to or not.

In the case of steel rails a number of points are shown by an etching that are not always patent to an examination of the sample with the eyes alone. The relative closeness of fiber of two rails can be readily compared, and fissures, faults, or cinder-spots, which are not apparent at first sight, often show themselves clearly when the etching is printed. In steel axles the difference in closeness of grain between the center and the circumference is clearly shown, the metal at the edge giving ample evidence of the compacting influence of the hammer.

In iron axles or other forgings the degree of completeness of the working of the material is clearly shown, and it can generally be determined whether, in case of purchased material, the forgings have been made of new iron or of scrap. Etchings made parallel with the fiber of the metal also give a good deal of its toughness, and of the care with which it has been worked. The mysterious heating of several axle journals is sometimes cleared up by an etching of a section of the journal showing an unevenly wearing metal, having some spots more prominent than others.

The more experience we have with etching tests, the wider we find the range of their usefulness to extend. One advantage of this system of tests is that no expensive plant or extended chemical knowledge is required in making them. They are within the reach of any one who can get a lathe for cutting off the specimens, and a few cents' worth of acid to make the bath.—*Cotton, Wool and Iron.*

GAS FOR IRON MANUFACTURE.—The owners of natural-gas wells in Pennsylvania appear to be repeating the folly of the man who had a goose that laid him golden eggs. Much complaint has recently been made about the extravagant prices asked for the gas, and now we learn that quite a number of establishments are either going back to coal or will manufacture

their own gas from coal. It is reported that the Vesuvius Iron Works at Sharpsburg, Pa., will probably be the first iron firm to quit using natural gas. A new furnace is being built at this mill to manufacture gas from slack and nut coal. This gas is to be tried in the puddling furnaces also. It is estimated that about 5000 cubic feet of gas is required to make a ton of iron, and at the present rate charged for natural gas it comes high enough to warrant the construction of plants to manufacture fuel. Numerous iron manufacturers are closely investigating the chances of getting a fuel cheaper than natural gas at present prices.

SELECTING IRON FOR BOILERS.—When the heat rays, from any source of heat, strike a body, one of three things may happen: either they penetrate into the mass and are absorbed, or they pass through it, or they are stopped at the surface without penetrating, and are either reflected back in the direction whence they came, or by making the angle of coincidence equal to the angle of reflection, pass off in an oblique direction. Polished surfaces and those with a clean color are usually the ones that reflect heat with the least amount of absorption. Of these, mercury stands in the front rank, and brass comes next. Tin, steel and lead are the reflectors that have only three-quarters the efficiency of brass. White reflects; dark and dull colors absorb heat, as do also wood and earthy substances. But they may be made into reflectors by covering them with a glass-like crockery. These properties, whether radiating, conducting, absorbing or reflecting, have important practical applications; they show, for instance, that, in the manufacture of boilers, a metal with high conductive properties should be preferred to one possessing it to a lesser degree; that the thickness of the sheet should not be excessive; that the polish of the exterior surface should be very slight; that if it is desired to prevent the heat from radiating from the surface of the boiler or steam cylinder, they should be covered with some poor conductor like wood, charcoal, sarthy matter, felt, etc., and then by some high reflector like polished iron, copper or brass. It is by the application of these same principles that in summer we wear light-colored clothing to reflect the heat of the sun, and in winter, thick, dark-colored clothing to retain the heat of the body.

SUPERIOR MATERIAL.—It is asserted on high authority that the iron used in the construction of our war ships is superior to that entering into the construction of any other navy in the world. Uncle Sam has been a little tardy in the matter of providing a navy, but no rash experiments are being tried, and a good deal has been learned by the failure of others. On the whole, it is probable that nothing has been lost by the delay, if the work is now pushed ahead as fast as is practicable. Patriotic citizens will rejoice when the American navy is once more respectable.

NEW LOCOMOTIVE DRIVERS.—A locomotive has for some time past been on trial on the Lowell system of the Boston & Maine railroad, in which the periphery of the driving wheels, instead of being round are composed of a series of plain facets connected with each other by very obtuse angles. These flat surfaces are from one to two inches in length, and are intended to give increased traction. All tests of this engine thus far have been satisfactorily met. So says the *Boston Journal of Commerce*.

A NEW ROTARY ENGINE has recently been patented by J. E. Beauchemin, Sorel, Quebec, Canada. It has a series of cylinders secured radially on a hub which forms a valve seat, with ports and an exhaust chamber, the ports leading into the cylinders, in which pistons having central openings operate on the rim of a wheel held eccentrically to the hub. The engine can be operated by water, air or steam.

AN IMPROVED HAMMER.—An improved hammer has a groove in the side of the head into which the head of any sort of a nail may be slipped and by a single blow fastened in its position. The hammer is easily withdrawn without unsettling the nail, which is driven home in the usual way. The advantage is apparent, especially in driving nails in a place seven or eight feet above where one stands.

OLD IRON IN CHINA.—In China old iron is in large demand for manufacture into mining tools, hoes, rakes, spades, plowshares and pickaxes. The importations are chiefly of English-made iron. In 1887 the quantity imported into China was 4,285,000 pounds, as compared with 3,784,000 pounds the year before.

TO HARDEN COPPER.—Melt together and stir until thoroughly incorporated, copper and from one to six per cent of manganese oxide. The other ingredients for bronze and other alloys may then be added. The copper becomes homogeneous, harder and tougher.

AN ENGINE recently erected at Chihuahua, Mexico, is said to be the largest ever constructed in sections. It has 400 horse power, and weighs 100,000 pounds. It is a compound condensing tandem Corliss.

GOOD SUBSTITUTE FOR BRONZE.—Thirty parts of good brass (35 parts of zinc, 65 parts of copper), 16 parts of copper, four parts of phosphorus, No. 0.

SCIENTIFIC PROGRESS.

Electric Refining of Sugar.

Which, if Successful, Will Revolutionize the Business.

Sugar merchants and brokers all over the country are in a flurry at the announcement recently made to the effect that the much-mooted process of refining raw sugar by aid of electricity had been brought to a consummation, and that by the middle of October a refinery using this process exclusively would be in operation. It is said that a party of English and American capitalists, representing at least \$15,000,000, is now prepared to erect electric refineries in all the principal cities on both continents if the process should be proved to be successful by a trial which is to be made on the 10th of October. This trial will have as its proof 1000 tons of raw sugars refined at the Brooklyn factory within 34 hours from the initial deposit of sugar in the melter. If this scheme is all right it will cause a revolution in sugar refining that will mark an important era in the history of that article of commerce.

This system is, however, says the *Philadelphia Record*, the same that has been in process of completion for the last 10 or 15 years, and it is the same that has so repeatedly failed in accomplishing its purpose that the faith of those who at one time believed in its ultimate success was so frequently shocked as to create a prejudice against it and eventually secure the condemnation and arouse the incredulity of its erstwhile advocates. Of late years an almost universal opinion declaring this system to be impracticable has been in existence, and nothing short of a thorough exposition of the system and its principles will restore the faith of men in the sugar trade. This, it is claimed, has been given, but it was satisfactory only to a degree. In a refinery in Brooklyn, a few days ago, a quantity of raw sugar was refined in the presence of a party of gentlemen interested in the process. Thirteen barrels of the raw material were refined at the recent test.

The cans were put into a receiver, from which it passed through two secret rooms containing the machinery before being run into barrels in a refined state. What the machinery is no one, apparently, except the inventor, seems to know. The raw cane goes into the receiver, and, once it leaves that simple piece of mechanism, it is not seen again until it finds its way out through a chute at the further end of the two "mysterious machinery-rooms. During the time the machinery was in operation (25 minutes) the refined article was turned out at the rate of one barrel for every two minutes. The process of refining is claimed to be perfectly dry, and it certainly must be, for when it came through it was drier than the raw cane, and the crystals were absolutely perfect. The promoters of the scheme say it will turn out sugar in ten different grades, the only alterations in the machinery necessary being the changing of the plates in the granulators.

CRYSTALS OF BUTTER AND FATS.—Among the most remarkable exhibits made before the American Society of Microscopists at its tenth annual meeting in Columbus, Ohio, Aug. 21st, or, indeed, that have ever been made anywhere, were the lantern slides of the crystals of butter, and the fats used in its sophistication, adulteration and counterfeiting. These were from the photomicrographs of Dr. Thomas Taylor, microscopist of the department, and were colored in the most exquisite manner to represent the appearance of the crystals under polarized light. Dr. Taylor was the pioneer in the work, and it has been but a few years since the idea of using the microscope and polariscope appearances of the crystals of the different fats as tests of their purity, first presented by him at the Cleveland meeting of this society, was fairly hooted at by a large portion of the scientific men of the country. To the society is due the credit of first examining into Dr. Taylor's claim, and of reporting favorably thereon. To-day the very men who three years ago derided and lampooned Dr. Taylor are using his very methods, quietly and conveniently ignoring alike the origin of the same and their own unreasoning opposition thereto.—*St. Louis Medical and Surgical Jour.*

PURIFICATION OF MERCURY.—The author effects the purification by passing air through the mercury for 48 hours. The impurities, zinc, lead, tin, etc., collect at the top of the tube in the form of a black powder. The removal of traces of silver and gold is not necessary for mercury intended for filling barometers and similar instruments. These impurities do not affect the density of the mercury nor alter the appearance of the meniscus. The author considers that if pure air has any oxidizing action upon pure mercury it is so slight as to be scarcely appreciable. Platinum in thin foil is not attacked by mercury in the cold, but on prolonged boiling the platinum is attacked, the greater part remaining in suspension as a black powder.—*J. M. Crafts.*

ACCIDENTAL ALLOYS.—The astonishing changes which are produced by small proportions of foreign matter in metals are not necessarily of small practical importance, as very slight impurities in metals for certain purposes might lead to serious consequences. Robert Austin gives two striking illustrations of this possibility. A small fraction of his-muth in copper will reduce its electrical con-

ductivity sufficiently to cause any submarine cable made with it to become a commercial failure, and the message-carrying power of copper cables is said to have doubled since the early days of telegraphy, on account of the increased purity of the copper. Pure gold has a breaking strain of from 16 to 17 tons to the square inch; but when alloyed with but two-tenths of one per cent of lead it will break with a slight blow under a trifling strain.

OCEAN WAVES IN A GALE.—An English sea captain has made what are probably the most careful observations which have ever been recorded. He writes to the *Liverpool Mercury* that during a voyage around Cape Horn he measured the height of the waves in a gale. To do this he went up in the main rigging to get, if possible, the top of the wave coming up astern in a line of sight from the mast to the horizon at the back. The reason he selected the mainmast was this, that, as a rule, it is nearly amidships, and when the sea is running, the sea ahead and from aft lifts the two ends, forming a hollow amidships (the actual foot of the wave below the mean draught, equal to the slight elevation, and the observer necessarily is above the true height). It was a difficult operation, but he obtained some good observations, marking the height of the waves on the mast. On measuring the distances from these to the mean draught he found them to be as follows: 64, 61, 58 and 65 feet respectively, varying in length from 750 to 800 feet.

NEW TYPE OF PHOTOGRAPHIC PORTRAITS.—The method of obtaining the exact reproduction of a photograph, by which a genuine portrait under the form of a marble bust is the result, is thus given by *La Nature*: The model is placed behind a hollow column or thin pedestal of painted wood. If it has desired to represent a Roman emperor, a helmet of white cardboard is placed upon the model's head, his hair and face are whitened with rice powder, and those portions of the body that it is desired to render visible are surrounded with white flannel. The background should be formed of black velvet. It in no wise interferes with this operation if the arms be raised. After the negative is developed, the figure that it is desired to preserve is cut around with a penknife, and the arms and all the portions that are not wanted are scratched out. The glass thus becomes transparent where the scratching has been done, and in the positive the bust stands out from a black background.

THE LOS ANGELES BASE LINE.—Prof. Davidson of the United States Coast and Geodetic Survey has received telegraphic instruction to proceed with measurement of the base-line on the plains of Los Angeles, and his party is preparing to take the field at once. This base-line was selected by Assistant Lawson and the adjacent region carefully surveyed by Assistant Dickins. It is 10½ miles in length, and is the foundation of all the geodetic measures in the southern part of California, and is also a check base for the triangulation-work which has come southward from the Yolo base-line. The two measurements of the Yolo base-line made by Prof. Davidson differed only three-eighths of an inch in 10½ miles, and he hopes to beat even this record with the same apparatus. The members of the party are Messrs. Lawson, Morse, Nelson, Westdahl and Edmonds, and the whole number of persons at work will be about 24, with six or eight animals.

DEATH OF AN EMINENT SCIENTIST.—Dr. Clausius, memorable as the demonstrator, if not the originator, of the mechanical theory of heat, died August 24th, in his 67th year. His school days were spent in Berlin, and he particularly distinguished himself by proficiency in mathematics and natural philosophy. The bent of his mind was strongly in that direction, and he thus dropped into the study of certain questions in physics which finally led him to the elucidation of the great question of the mechanical theory of heat, which has placed his name high upon the roll of eminent discoverers in his particular line of investigation. If he was not the originator of the theory, he must at least be credited, by his work, "A Treatise on the Nature of Heat Compared with Light and Sound," with having transferred one of the most important natural laws from the domain of mere hypotheses to that of well-ascertained fact.

ELECTRICITY IN IRON MINING.—An application of electricity to iron mining is now proposed. It consists in the crushing of magnetic iron ore by crusher and rolls, and effecting a separation of the ore from the gangue by means of dynamos. An experimental plant is to be erected at one of the Marquette mines, and the machinery best adapted for work on a large scale tested. With the large water-rock piles of magnetite on that range, a due regard to economies and fair prices for ore, it is thought that there should be developed a paying business of handsome proportions.

CHLORIDES OF ALUMINUM.—In a note recently read before the Paris Academie des Sciences, M. Faure has described methods by which the chlorides of such substances as aluminum and silicon can be obtained in the dry way at a much lower temperature than has previously been the case. This he has accomplished by acting on the source of these elements at a red heat with a gas consisting of a mixture in suitable proportions of hydrochloric acid and naphthalene.

ENGINEERING NOTES.

An Ingenious Canal Lock.

French engineers have recently achieved a remarkable triumph in the line of canal locks, by which the principle of the common hydraulic elevator is in part applied to raising canal boats. One of these locks, or, more correctly speaking, "elevators," has been for some time in successful operation on the line of Nenfosse, in the northern part of France.

The system, briefly stated, consists in raising and lowering canal boats by balancing their respective weights, the process assisted by hydraulic pressure. The traffic on this canal, from the Atlantic to the highlands of North-eastern France, through the department of Pas-de-Calais, has reached 800,000 tons per year, and to raise each boat up the 98 feet incline at Fontinettes required under the old system five or six hours.

The engineers learned that Mr. Edward Clark had constructed in England a hoisting apparatus for 80-ton boats on the canal connecting the Trent and the Mersey. They adopted his plan, but enlarged and strengthened the "chambers" so as to raise a boat of 300 tons, and on the 8th of July the new lock was opened to traffic.

The plan consists, briefly, of two "chambers," reaching the whole distance from the level of the canal above to that of the canal below. In each chamber is a movable basin resting on the head of an enormous piston, which goes down into a cylinder below the level of the lower canal. The piston is worked by hydraulic pressure. The upright tubes, if we may call them such, can be connected or disconnected below by opening or closing an immense paddle-door. Thus the basin containing the boat can be made to slide up or down in the chamber, to the walls of which it is fitted.

Suppose a boat to have moved into one chamber from the level of the canal below, and another into the other chamber from the level of the canal above; the superior weight of the higher boat and the water floating in it in the basin rapidly sinks it till both boats are in the middle, when an equilibrium would naturally occur. To remedy this the water is withdrawn from the basin of the ascending boat, when a very moderate addition of hydraulic pressure causes it to rise to the level of the upper canal, as the other boat sinks to that of the canal below. The chambers or tubes are, of course, very strongly made, being lined with copper and ribbed with steel. Boats are now raised and lowered in three minutes instead of six hours, as formerly in the series of locks.

DAMMING THE RIO GRANDE.—A GIGANTIC SCHEME.—Late dates from El Paso state that Major Anson Mills of the Tenth Cavalry, at present stationed at Fort Grant, Ar., has addressed to the citizens of El Paso a project to construct a dam across the Rio Grande, four miles above the city, at a place where the bluffs come within 400 feet of each other and consist of solid rock, and where the bed of the river is also rocky. He proposes to build a dam 60 feet high of stone and Portland cement, and thus create a lake 14 miles long. This would hold water enough to permanently irrigate Rio Grande valley on the Mexican as well as the American side of the river. An irrigating canal could thus be carried past the city of El Paso 70 feet above its level. The water could be utilized for hydrants and fire-plugs, as the pressure would be ample. The lake thus formed would be from 6 to 8 miles wide and cover 50,000 acres of land which is not settled and is mostly owned by private parties. This would have to be purchased or condemned by legal process. The plan is very favorably received by the citizens of El Paso, and will probably be acted upon. It would also supply water-power to run all the factories in El Paso.

BUILDING UP—NOT PULLING DOWN.—In the construction of engineering works in this country the one problem to be solved is always how to build up, and there is never a thought of how to pull down. Consequently it is quite a novelty to read in the description of a new railway bridge in Sweden, that "there are holes in the granite pillars for placing dynamite in case it should be necessary, during a war, to blow up the bridge."

A NEW PRINCIPLE OF PROPULSION.—The Italians have made use of a new principle for the propulsion of some of their fast gunboats and torpedo-catchers under construction. They have improved on the twin screw of modern steamships by the addition of a third screw moved by a separate shaft and set of anginas. The three screws are placed in the angles of a triangular pyramid.

A NEW STYLE OF ELECTRIC RAILWAY is in process of construction in a suburb of St. Paul, Minn. The railroad is an elevated structure, and the cars are hung below it close to the street level. They hang from sets of wheels taking their power from the tracks, which are charged with electricity. A speed of from 8 to 10 miles an hour is claimed for the cars.

The new quartz mine in Bailey Gulch, Jefferson county, Montana, are looking well. A great deal of prospecting has been done there this season.

USEFUL INFORMATION.

THE INTERCEPTION OF TELEGRAMS OVERCOME.

As every great invention has its disadvantages, however trifling, so the telephone has its drawbacks, remarks *Iron*, London. The telephone is so acute of hearing that before it every secrecy of telegraphing disappears. If, formerly, it was desired to ascertain the secrets of the telegraph wire, the latter had to be cut, and an apparatus inserted. Now, with the help of the telephone, all telegrams may be heard unobservedly, even from a great distance. It is only necessary to carry a telegraph wire of moderate length parallel to the original line, and insert it in a telephone, from which the Morse signs may be read off by the ear. This would be very awkward in the case of war telegrams. Even guarding the line would be of no use, for the enemy might, at a distance perhaps of half a mile from the telegraph line, where he could not be seen, secretly set up his intercepting apparatus, consisting of a hundred yards of parallel wire and a telephone. How is this difficulty to be overcome? The question is solved in a surprisingly simple manner by Herr Heinrich Discher, who, in the *Elektrotechniker*, proposes cross telegraphing. If telegrams are sent from opposite directions on the same wire at the same time, the listener at the telephone only hears a potpourri of confused sounds. In practice, the matter may be solved in this way. One station sends actual telegrams, the other a dispatch previously agreed on. As long as the operator at the former station sees this dispatch coming in, he may be sure that no eavesdropper reads the telegrams he is sending. The Austrian war office is said to have paid great attention to the matter lately.

THE MYSTERY OF THE COMB.—It would be curious to know what mystic meaning our forefathers attached to so simple an act as that of combing the hair. Yet we learn from old church history that the hair of the priest or bishop was thus combed several times during divine service by one of the inferior clergy. The comb is mentioned as one of the essentials for use during a high mass when sung by a bishop, and both in English and foreign cathedrals they were reckoned among the costly possessions of the church. Some were made of ivory, some were carved, others gemmed with precious stones. Among the combs specially known to history are those of St. Neot, St. Dunstan, and Malchies. That of St. Thomas, the martyr of Canterbury, is still to be seen in the Church of St. Sepulchre, at Thetford, and that of St. Cuthbert at Durham cathedral.—*Cornhill Magazine*.

DETECTION OF GAS LEAKAGE.—Dr. Bunte's proposed new method for detecting gas leakage by means of palladium paper has been rendered still more delicate by Herr Schaufellers, who uses, to every three parts of chloride of palladium, one part of chloride of gold. The increase of sensitiveness may be partly due to catalytic action, that is, to the mere presence of the gold, perhaps to the action of traces of acetylene upon the gold solution. The solution used for making the paper contains three eighths per cent of chloride of palladium and one-eighth per cent of chloride of gold. One pint costs about 9s., and will steep filter paper enough for 8000 to 11,000 tests. The main sources of error are tobacco smoke, stove, and smoky chimneys, which let carbonic oxide into the room, the vapor of fuel oil, onion smell, mercury vapor, and sulphureted hydrogen.

A NEW WAY TO DRESS KID-SKINS.—An enterprising German leather manufacturer has discovered a way to tan American kid-skins so that they become in every way superior to the French article in durability and finish. "The process of tanning," says the *New York World*, "is performed entirely by American workmen, and the skins sell for from 50 to 70 per cent less than the French. Not only are the shoe manufacturers all over the country using the new product, but already thousands of dollars' worth have been exported to Germany, France and Austria. The dressing of kid-skins was almost monopolized by France until this manufacturer hit upon an idea better than theirs."

AN UNBREAKABLE SUBSTITUTE FOR GLASS.—An unbreakable substitute for glass is made by M. L. C. A. Marguerite of Paris, by immersing wire gauze in a heated etatin in a thin paste formed of soluble glass, gelatin and glycerine, or glucose, in proportion varying according to the use for which the material is designed. When nearly dry, the sheets are dipped in a concentrated solution of chrome alum or bichromate of potash. Any desired coloring-matter may be incorporated with the gelatin, and copal or other protective varnish may be applied to the "vitro-metallic" pane.

KICKER AND CROAKER.—The kicker is a developer; the croaker is an incubator. The kicker incites to improvement; the croaker to indignation and resentment. The kicker only is heard when he is given \$1 accommodations at \$3 rates; the croaker would have just as noisy if he was getting \$3 accommodations and paying nothing. The kicker is a lively, jovial, progressive fellow; the croaker is a dismal nuisance, who lags superfluous on the stage.

LUBRICATING VIRTUES OF VARIOUS OILS.—The Italian Admiralty have, recently caused to

be carried out a number of experiments with a view to testing the comparative merits of castor oil and of olive oil for lubricating purposes on board ship. From the results thus obtained they have given orders that henceforth all exposed parts of machinery are to be lubricated exclusively with castor oil, while the mineral oils are to be used for cylinder and similar lubrication.

A DEEP HOT-WATER SUPPLY.—A remarkable instance of the increase of temperature in the earth toward the center has been presented at Peath, where the deepest artesian well in the world is that now being bored for the purpose of supplying the public baths and other establishments with hot water. A depth of 8140 feet has already been reached, and it furnishes 176,000 gallons daily at a temperature of 158° F. The municipality have recently voted a large subvention in order that one boring may be continued to a greater depth, not only to obtain a larger volume of water, but at a temperature of 176° F.

A SOUTHERN CORRESPONDENT OF THE CULLIVATOR finds that a pure article of hog's lard rubbed in is a most excellent remedy for warts on horses, and will invariably effect a cure at the first application. In a varied experience with horses, cattle and mules, he has never known a wart to withstand a second application. They generally commence sloughing off after the first application, and, to all appearances, without the slightest pain. The remedy is simple and may be worth trying.

A LONG LINE OF SHAFTING.—Wm. Contie & Son of Troy, N. Y., recently placed an engine near the center of a line of shafting 2300 feet in length. The next longest line of shafting is said to be running at Power Hall, Cincinnati, which is only 900 feet long.

TO REMOVE THE "GLAZE" FROM CLOTHING. Soil or shininess on coat-collar or sleeve may be removed by sponging them off once or twice a week with the following preparation: One ounce of ammonia, one ounce of alcohol, one ounce of ether, one quart of water.

ONE HUNDRED AND TWENTY-TWO passenger trains leave the Grand Central depot, at New York, daily.

GOOD HEALTH.

Annual Sanitary Review.

Dr. Barger, the Health Officer, has filed with the Board of Supervisors his annual report, from which is taken the following statistics:

There were 6036 deaths in the city during the past year, against 5359 the preceding year. The death rate has been slightly in excess over last year. The rate per thousand last year was 17.86; this year, 18.27.

The death rate among the Chinese in the city has been 17.63 per 1000; among all others, 18.36. The smaller death rate among the Chinese may be accounted for from the fact that they have but very few children, among whom the proportion of deaths is always much larger than among adults.

The principal diseases and the number of their respective victims were: Consumption, 905; cancer, 190; heart disease, 387; smallpox, 69; diphtheria, 151; typhoid fever, 152; eczema, 28; pneumonia, 577; Bright's disease, 132; bronchitis, 173; violent deaths, 296.

The excess of deaths from consumption over those of the year preceding was 133, from pneumonia, 266; from heart disease, 95; and from bronchitis, 118. The record for the preceding year shows no deaths from smallpox. The total of zymotic diseases for the year is 888, against a total of 810 for the year preceding.

The number of births registered is 1780, against 1346 for the preceding year. The proportion of these figures, as compared with the deaths, is due to the neglect of physicians to register births as required by law.

The dread disease of cancer stands fourth on the list in the number of its victims. This fact calls loudly for an investigation into the alleged "cure for cancer" by a practitioner in this city, which treatment is ignored by the medical faculty, notwithstanding the abundant evidence of its verity, which is open every day to the faculty and the public at 224 Post street, where numerous patients can daily be seen under treatment and the curative process witnessed. The matter will undoubtedly be brought before the Legislature at its coming session, and the reason why our State Board of Health refuses to investigate will be inquired into. So far as our personal observation goes, we do not think there is 1 in 100 of the people, outside of the faculty, who, if the question was put to them, would not demand an investigation in the interest of both science and humanity.

Smallpox.

The Board of Health has been very active and efficient in securing every possible immunity from this scourge. The number of cases of smallpox reported in this city during the year was 568, of which only 69 resulted fatally. The cost to the city has been \$45,000. Measures are still in progress which aim to prevent any further outbreak. Danger is to be expected from the cast-off clothing of patients, which was laid aside before seeking the hospital. All such apparel should be destroyed or carefully fumigated.

gated. Another source of danger is from infected rags, which may find their way to some of the factories in and about the city engaged in making rag carpets, mattresses, etc., from such refuse. The Health Officer has very properly reported these matters to the Board of Health, which promptly insisted upon a proper cleansing and disinfection of the rags before being used. The garbage and sewerage question in this city is also engaging the attention of our health conservators.

The Yellow Fever.

The State Board of Health has appointed Dr. S. S. Herrick as Sanitary Inspector, to visit the southern borders of the State, with a view of investigating the introduction of infectious diseases in California.

The new inspector has established his headquarters at Yuma, and already entered upon the discharge of his duties. His first inquiries will be devoted to an investigation as to the likelihood of the introduction of yellow fever in this State. He will also turn his attention to the spread of smallpox, as black smallpox is known to exist in Mexico now.

Dr. Herrick is said to have had a wide experience as a sanitary officer, having been connected with the Board of Health of New Orleans during two yellow-fever epidemics. He was also for a time in charge of the San Francisco pesthouse.

CONTAGIOUS DISEASES.—Scarlet fever, a contagious disease producing a large annual mortality, is caused by a specific poison which emanates from the person of the patient, and can be caused by no other means, and this poison is remarkable for the tenacity with which it affixes itself to objects, which, if portable, may convey it long distances, and for its tenacity of life, which renders it difficult to destroy. Diphtheria, also a contagious disease, and largely fatal, may also arise from other causes than contagion, notably from fermenting filth, and requires, not only isolation, but cleanliness for its extinction. Typhoid fever and Asiatic cholera, while not directly communicable from person to person, are spread by the dejects of their victims, which contaminate the water-supply, and thus an efficient disinfection of these dejects is a very desirable thing to accomplish. Smallpox may be exterminated by vaccination, and this, I am happy to concede, is a fact on which the public requires less information than most others, albeit there are skeptics here. It is evident if the public knew how diseases arise and are disseminated, it would be prepared to more heartily and effectually second the endeavor of sanitarians to limit and subdue them. In proportion to its knowledge of sanitation would its zeal increase.—*G. A. Collamore, M. D.*

CHINESE HAVE NO NERVES.—The *North China Herald* says the quality of "nervelessness" distinguishes the Chinaman from the European. The Chinaman can write all day, work all day, stand in one position all day, weave, beat gold, carve ivory, do infinitely tedious jobs for ever and ever, and show no more signs of weariness and irritation than if he were a machine. This quality appears early in life. There are no restless, naughty boys in China. They are all appealingly good, and will plod away in school without recesses or recreation of any kind. The Chinamen can do without exercise. Sport or play seems to him so much waste labor. He can sleep anywhere—amid rattling machinery, deafening uproar, squalling children and quarreling adults. He can sleep on the ground, on the floor, on a bed, on a chair, in any position. It would be easy to raise in China an army of a million men—nay, of ten millions—tested by a competitive examination as to their capacity to go to sleep across three wheelbarrows, head downward like a spider.

EFFECTS OF SEASICKNESS AND THE REMEDY.—Dr. Dastre, a French physiologist, who has been experimenting with animals to determine the nature of seasickness, reports that after they had been subjected to various kinds of motion, corresponding to the rolling and pitching of vessels, he found their intestine strangely mispleased. He concludes that a similar disturbance produces seasickness on board ships. Cocaine is said to be an excellent remedy. Another French physician, who agrees with Dr. Dastre as to the cause of seasickness, claims to have discovered two infallible remedies, one a mixture of atropine and erythrine, and the other caffeine.

SIGNS OF DEATH.—It will probably surprise most people to learn that both cessation of respiration and of movement of the heart are rejected as signs of death by a French lecturer, in considering the precise moment when life ceases. Heart beats have been known to continue for an hour after the body was beheaded, while, on the other hand, they may temporarily cease in fainting.

SALICYLIC ACID FOR RHEUMATISM.—Dr. Donald C. Hood has collected many facts relating to the use of salicylic acid for rheumatism. Of 728 patients treated with salicylates, 523 were relieved of their pains within seven days, whereas of 612 patients treated by other methods only 140 were relieved within the same time.

WEAKNESS OF THE EYES.—It is not generally known, but should be, that weakness of the eyes is often due merely to dyspepsia.

Passing Events.

Political affairs are just now attracting attention more than anything else, but in a few weeks this will all be over and people will settle down to business again.

Prospecting is about over for the season in most parts of the coast, though in this State, except in the more mountainous portions, it can be carried on for some time yet. During the winter the prospector's occupation is gone, and those who have been searching over the mountains now gather to the towns and camps. It will probably be some months yet before

any active steps are taken in the matter of the Government Commission to investigate the debris question. It is to be hoped that this time the subject will be thoroughly examined by competent and unbiased engineers.

Considerable attention is being paid in this State to prospecting for oil, coal and gas. All of these substances have been more or less neglected in favor of gold. There are other mineral products besides these which ought to be developed in California, but capital is needed, and that is not so abundant for such purposes as it ought to be.

Mexican Mining Investments.

From time to time we have referred to the advance in mining matters in Mexico. While in some cases foreign investors have been well repaid, in many the amounts risked have been lost; this, too, in cases where the speculation was most promising and the mines apparently of value.

Inquiry into the causes of some failures brings us into the possession of facts which are worthy of consideration by parties who are favorably disposed toward investing capital in Mexican mining ventures.

Mexico is at our very door, yet it is a country whose manners, customs and language are totally different from our own. The engineer who, never having had any practical experience in the management of mining properties in that country, goes there to report on a property, is handicapped to that extent that his report may be utterly valueless.

Any one unable to speak the language sufficiently well to personally direct his operations will, in 99 cases out of 100, be taken in. Experience would teach him that the Mexican people always desires to please, and in answering questions will endeavor to give the answer he thinks wanted, irrespective of what the truth may be. This prevarication is really done from a desire to please, and not maliciously. If the engineer does not speak the language, he is at the mercy of his interpreter for all collateral data. Outside of what the engineer sees with his own eyes, the matter on which the value of his report depends comes to him through his interpreter; hence the value of the report is contingent on the veracity of the interpreter.

To be safe, no one should employ for the examination of a Mexican property an engineer who has not had practical experience with the class of people he will have to deal with or who cannot speak Spanish.

The country is notorious for rich veins, and this often misleads engineers, for, with very few exceptions, the average value of the vein decreases with depth while the width remains unchanged. We do not wish to be understood as saying that the ore of all the veins decreases with depth; still, where veins have been profitably worked at a depth an examination will generally show that a bonanza, or, as the Mexicans will say, a "claro rico," has been struck. In short, Mexican mines are pockety. This being the case, the past history of the mine is no criterion on which to base the future prosperity of the concern. What is *in sight* should be the only factor taken into account when estimating the value of a property. Then as to traditions; hardly a report comes to us relative to a Mexican property that does not predicate immense wealth from the mine on its tradition; they are worth just the paper they are written on, no more.

Should some tradition be eventually proved true, it must be considered a wonderful piece of good fortune.

The facility with which traditions grow is exemplified in the case of a Sonora mine, which was the property of a San Francisco company. Work was suspended on account of the unsafe condition of the shaft and the property shortly after abandoned. At the time work was suspended, about 20 tons of ore, assaying some \$30 to the ton in gold, was broken in one of the drifts. Some five years later, the old superintendent being in the neighborhood of the mine, concluded to take a look at it. He found, as was anticipated, that the shaft had caved to the surface. A Mexican living near by gravely informed him that the cave in the mine had buried 300 tons of ore worth \$100 per ton; so much for traditions.

There are to be had thoroughly reliable engineers whose reports can be depended upon, so a company may come into possession of a really

valuable property; but the simple fact of owning a valuable property is no guarantee of the financial success of the same. The method of treatment of the ore is a very serious question with a Mexican property; the questions of fuel, transportation, water, facilities for repairing machinery, etc., require much more consideration in that country than they do in this. Methods of reduction that would be advisable in this country might bankrupt a company there. Six months given to the study of the best manner in which to handle the product of the mine would seem to be time lost, but in the long run it would be found to be money gained. In the meantime developments can go on in the mine; good reserves mean economical working. The question of management on the property is one of vital importance. The greater part of the failures, where the mine has had any value at all, will be found to have had their cause here, and generally the cause will be found to be too much management. The idea that a man can sit in his office in the United States and economically administer the affairs of a property thousands of miles away is simply preposterous. A general line of action may be laid down for the superintendent, he being free to carry it out in any way he may deem most advisable. This makes him personally responsible for the results, whereas if he were acting under the orders of a man from whom it would take 10, 20 or more days to get an answer when instructions were required, sooner or later there must come a conflict of authority which can only result in damage to the property and financial loss to the company.

Legislating for the Protection of the Mineral Domain.

Having had something to say of late in regard to the manner in which the mineral domain is being unlawfully taken up as agricultural land, it is gratifying to see that our efforts in that behalf are being seconded in influential quarters. Senator Stewart of Nevada has introduced in the U. S. Senate a bill designed to guard against this reprehensible practice, so far as may be. The details of this bill have not, we believe, been fully perfected, Senator Stewart being desirous to further consult with his mining constituency in regard to its provisions before having it reported on in committee.

The matter is one of inherent difficulty, and it is not easy to say just what additional legislation is required to cure the evil complained of; that is, how a law shall be framed that will duly protect the rights and interests of all parties concerned—the miner, the public and the agricultural claimant.

In this strait it is well that the trustees of the State Mining Bureau have appointed a committee, consisting of two of their number, to inquire into and consider what further remedial measures should by Congress be adopted, there being already a law on this subject. But the trouble is, this law, never very efficient, has, by the various decisions of the Land Commissioner and the Department of the Interior, been rendered so nearly negatory that it calls for stringent amendment; the decisions alluded to having almost always been notoriously favorable to the agricultural; homestead, railroad or other claimant contesting the mineral character of the land.

This committee of the Mining Bureau will confer with Senator Stewart on his arrival in the city, tendering such suggestions touching the amendment of the present law, or the framing of an entirely new one, as they may deem expedient. As these representatives of the Mining Bureau are conversant with the matter in hand, and the committee comprises some good legal talent, it may be expected that anything they may have to offer in this connection will be duly appreciated by our national law-givers as well as by the public at large.

The management of the Horn Silver mine, Utah, has not been very satisfactory to all the stockholders, but at the recent annual meeting the "Franklyn" management was defeated, and the mine passes into the hands of Bache McE. Whitlock and Allan C. Washington of New York, Jas. T. Little and Joe Jennings of Salt Lake City and Frank Farnsworth of Beaver City, Utah, and other minority stockholders.

The advancement of all mining sections depends considerably upon capital being invested to open up the hidden wealth.

Erroneous Chronology of the Marshall Gold Find.

About one year ago there was brought to light and published in this city a diary, or portions of a diary, kept by Henry W. Bigler, one of the men employed on the Sutter sawmill at the time of the Marshall gold discovery. In this diary occurs an entry which purports to have been made on the day that that discovery took place, but which conflicts with the heretofore accepted date of that event, which, according to Marshall, Sutter and others in a position to be correctly informed on that point, occurred on the 19th day of January, 1848. According to the entry in Bigler's diary, it occurred on the 24th day of that month.

As there seems a disposition on the part of some writers to adopt this latter as the true date of the gold discovery, it may not be amiss to examine a little and see what, if anything, there may be to justify such change in the chronology of that notable occurrence.

According to Marshall and Weimer's version of the discovery, they two were, on the morning of January 19, 1848, walking down the mill-race to see what execution the water let in the preceding night for the purpose of deepening the channel had effected. Marshall being a little ahead, was the first to spy a piece of yellow metal lying on the side of the race, which, picking up, he and his companion, after careful examination, came to the conclusion was gold. Searching further and finding more of this metal, they resolved that they would keep the discovery a secret long enough at least to enable them to get in a stock of saw logs, the mill itself being then about completed. They knew, as subsequently happened, that if the secret got out the men in their employ would at once quit work and go to gold-digging, thereby putting an end to all log-hauling and lumber-making, notwithstanding the latter was so much needed at the Fort.

Adhering to this resolution, both Marshall and Weimer assure us that they kept the gold find a profound secret for several days after it happened, having succeeded meantime in getting a supply of logs cut and hauled to the mill; this accomplished, they let the secret out—that is to say, having kept it to themselves until the 24th of the month, they then gave it publicity, and the fact coming to the ears of Bigler, he, as was his wont when anything noteworthy happened, jotted it down in his diary, the entry running thus: "January 24th—This day some kind of metal that looks like gold was found in the tail-race." Now clearly Bigler could not have made that entry on the day the gold was found; to suppose that he did would be to presume that Marshall and Weimer rushed off at once, and not only acquainted our chronicler with the fact, but took along a quantity of the yellow metal for his inspection, which would be to gainsay reason and discredit all that these men have told us about the circumstances attending the gold discovery.

That Bigler did not at the time attach much importance to the reputed gold find is evident from the fact that there appears no further entry in his diary until January 30th, when the following remark occurs: "Our metal has been tried and proved to be gold. It is thought to be rich." For nearly a week after the discovery, adopting his own chronology, he continues working on and about the mill, paying so little attention to it that only after the expiration of six entire days does he find out that the metal is actually gold.

The discrepancy between these dates is easily explained. Marshall gives us, as he had every reason to do, the veritable day on which the discovery took place; Bigler the day on which he first heard of it, under the impression, probably, that it was really the day on which the event happened, or he might have worded the entry in the manner he did through inadvertence. Nor is it on the testimony of Marshall alone that this version of the ever-memorable incident rests. It is confirmed by the statement of Peter L. Weimer, Mrs. Weimer, his wife, and all the hands at the mill other than Bigler, and even by that of General Sutter himself, who could by no possibility have been mistaken on this point. To suppose that all these people, who had the best of opportunity to know whereof they speak, and the best of reasons for speaking correctly, should have been mistaken, or that they conspired to testify falsely, is out of the question.

As has been before mentioned in the PRESS, a
 rge portion of our onasting trade is dependent

C. A. PILLSBURY & Co., the famous Minneapolis millers, who four years ago inaugurated the profit-sharing system, have recently distributed \$40,000 among their employees.

OUR LUMBER INTERESTS.

A Novel Method of Piling Lumber.

There seems to be no limit to the applications of mechanism, and this is well illustrated by the novel lumber-pile, the invention of Mr. Carlos E. Donshee of Chicago, Ill. The invention consists, essentially, of a portable framework that is well braced. Inside the framework are track-rails, suspended by means of ropework. These ropes pass over grooved pulleys at the tops of the posts, and are thence carried down to spools and attached. These spools are so placed near the base of four of the main posts of the framework that all the ropes for elevating the tracks are connected with them. The spools are all connected by means of horizontal shafts and beveled cog gearing, so as to move in unison when impelled by means of power applied to the gearing. Upon the tracks run a car having four-flanged wheels.

This car has at each end a series of pendent hooks, which are attached at their upper ends to cross shafts, which permit a vibratory movement of the books. The car is composed of a light frame, and attached to the rear cross-piece, and hanging down, are pieces of metal that act as gauges for one end of the lumber. Short trestles stand upon a wooden floor, to which four of the main posts of the framework are secured at the base. The operation of piling lumber by this method is very simple. The trestles are first placed at such a distance apart that the ends of the lumber will project several inches. The lumber is now laid upon the trestles, one course or more at a time, and at any width desired up to the capacity of the apparatus. The tracks, together with the car, while the lumber is being arranged upon the trestles, are suspended above and out of the way of the operatives. When all is ready the tracks are permitted to descend, carrying with them the car, the books for catching the lumber having been turned back by means of a rope in the meantime, pass below the ends of the boards, and are then permitted to assume a normal position below the boards. If power is now applied to the gearing, the car will be lifted, and when at the proper height, the car is moved along the track by means of ropes that hang down within easy reach, until it stands over the lumber-pile. If the rope that operates the books is now pulled, the boards will be dropped upon the top of the pile. The car, being relieved of its load of boards, is now run back to the position over the trestles, when the operation described can be repeated, it being only necessary to lift the car each time as much higher than before as to allow for the increase in height of the lumber-pile by the preceding last load of boards. By this means lumber can be piled to any desired height, and with the expenditure of but very little time or labor in comparison with the ordinary methods. This invention will soon save its cost, and all those engaged in the production, sale or consumption of lumber should investigate its unusual merits.

Timber Resources of the South.

J. E. Emerson of Beaver Falls, Pa., writes to the *Journal of Progress* on the timber resources of the Southern States, as follows:

"When in North Carolina nearly one year ago, I made inquiry as to the supposed amount of timber still standing in the Southern States alone, and on getting hold of the United States census of 1880, I found that there was at that time supposed to be 112,176,000 feet of 'long leaf pine' alone, besides the vast quantities of 'hard timber,' of excellent qualities, comprising over 200 different kinds of wood.

"Georgia appeared to be the leading State for timber and lumber mills. Of her 137 counties, 73 of them had large pine forests. She then had 665 sawmills, valued at \$4,875,452.

"The total capital employed in the Southern States at that time in lumbering was estimated at over \$21,000,000, and the total product at over \$36,000,000, which must be increased at the present time to over \$50,000,000.

"The ten cotton States alone cover an area of 690,000 square miles, with a population of over 13,000,000.

"Railroads are being built and projected for the development and utilization of these vast forests, for English capital is finding its way there in purchasing hundreds of thousands of acres of this timber, including the lands which are being settled to a considerable extent by foreign population.

"The pineries of the Northwestern States are being rapidly exhausted, and those of the Southern States as yet hardly touched, must, of necessity, soon become the main source of supply, and will be more largely drawn upon for the wants and necessities of home trade and commerce.

"The long-leafed pine is the most valuable timber of the South, and must come into general use for building material; while the oak and walnut make the finest furniture and ornamental work of any in the world.

"Northern lumbermen, with their skill and genius, accompanied by capital, are finding their way there, and we may confidently expect developments in the future never before dreamed of."

A GREAT LUMBER STATE.—Although the drain upon Michigan forests for 30 years past has been great, the State still maintains its pre-eminence among the lumber-producing States

of the Union. Out of 7,757,916,784 feet of pine lumber cut in the Northwest during the year 1887, Michigan produced 4,087,797,304 feet, or more than one-half the entire product, exceeding its product of 1886 by 103,000,000 feet. Out of 4,116,466,750 shingles cut in the Northwest, Michigan mills cut 2,770,164,750, or nearly two-thirds of the whole. The figures, large as they are, hardly convey an adequate idea of the piles of lumber which they represent. Leaving aside the posts and scantling, the Michigan product of pine lumber alone would lay a plank walk six feet wide and two inches thick around the globe at the equator, and erect an eight-foot board fence each side of it. The shingles, counting 1000 to the square of 100 feet, would roof over ten square miles of territory. In producing this number nearly 1000 mills, large and small, are operated. The capital invested approached \$40,000,000, and the value of the product at wholesale prices reached \$65,000,000. Aside from those engaged in shipping the product, the industry gives employment to over 35,000 men. During the year 58 sawmills and other wood-working establishments in the State were burned, and about the same number built or rebuilt.—*Detroit Tribune*.

STRAW LUMBER.—The reputation of American straw lumber has evidently gone abroad in the world. Among the items in an English exchange is a reference to an article that is by no means rare in this country, a substitute for lumber made of straw paper pulp: A house has been constructed in Philadelphia which is to be made entirely of lumber manufactured from straw by the pulp process. This house is to represent an American suburban villa, announced to be "handsome, and artistic in design," 2½ stories high, and covering a space of 42x50 feet. It is constructed entirely of materials manufactured from straw—foundations, timbers, flooring, sheathing, roofing, everything in fact, including the chimneys—the material being fireproof as well as waterproof. The inside finish is to be in imitation rosewood, mahogany, walnut, maple, ash, ebony, and other fine woods, the straw lumber taking perfectly the surface and color of any desired wood. This straw house is to demonstrate how far the inventive Yankee has succeeded, not in showing us how to make brick without straw, but how to produce timber from straw. If, after this brilliant exhibition of inventive genius we do not bow down and worship him as the "liker" of creation, we may consider ourselves lost to all sense of what is proper under the circumstances.

THE LUMBER EXHIBIT AT THE MECHANICS' FAIR.—The exhibition of lumber, from rough-barked trees to polished woods, at the late Mechanics' Fair was considered finer than at any previous exhibition ever held. The exhibits were sent in from all parts of the State. They included the largest single stick of lumber in the world, which is 151 feet long, 20 inches square in transverse section, and contains 5033½ cubic feet. In the Humboldt county exhibition there were two pine butts, one 6½ feet in diameter and the other 5½ feet. In the same exhibition there was a redwood plank 80 inches wide and 11 feet long. It is one of five similar planks cut from the same log. In the Sonoma county exhibit there was a hutt of the great "Mission" tree, under which 150 camp-meetings have been held near Guerneville. From Mendocino county a plank 66 inches wide, 3 inches thick and 12 feet long was on exhibition. Local dealers sent in upward of a hundred different varieties of wood, rough, stained, varnished and polished. No other State in the Union, and probably no other country in the world, can make an exhibit of such a variety of useful woods as California.

THE RAILWAY AND LUMBER BUSINESS.—Determined efforts are being made by the railways of the United States to push farther and farther into the forest regions of the great Northwest. The Chicago, Milwaukee & St. Paul Railroad Co. contemplates extending its line up the Wisconsin river, through the Gogebic mining region, to Lake Superior, together with a branch from the main line to the valley division at some point south of Wausau. This enterprise will greatly facilitate lumbering in a very important district. In Michigan, it is the settled policy of the Flint & Pere Marquette and Michigan Central Companies to lay down branches wherever much pine is to be reached. The former company baled last year no less than 134,000,000 feet of logs. Private logging railways are also increasing in number and extent throughout the country. A successful effort to establish rail shipments is in progress in the Saginaw valley. In 1880 that district sent out 27,000,000 feet of lumber by rail and 770,000,000 feet by water. Last year the rail movement amounted to 176,000,000 feet, and that by water to only 591,000,000 feet. The principal gain in the former direction has occurred since 1884.

THE EXPORT OF LUMBER, boards, deals and planks to Mexico, Central American States and the several countries of South America, from this country, continues to increase in value. During the month of January last, the increase in value of exports to Mexico was about \$8300. To the several countries of South America the increase in January last over January, 1886, was \$89,686. There was a slight decrease in exports of these goods in January last to the West India islands, as compared with January, 1886.

LUMBER IN CALIFORNIA AND FLORIDA.—How great the contrast between the lumber business in California and Florida! In this State hundreds of vessels are constantly engaged in the trade; indeed all the shipping suitable for such business that can be had on the coast, and new ones are all the time on the stocks and being built as rapidly as possible, and yet transportation facilities are short. A lumberman tells, in the *Ocala Banner* (a Florida paper) the following story of the utter demoralization of the lumber business in that State. This, of course, was months before the sad visitation to that State of the dread epidemic from which she is now suffering. The *Banner* said: "If every mill in reach of Ocala were shut down, and the teams turned to grass, the owner would be better off. We are selling lumber to-day worth \$20 per thousand at the mill for \$15 per thousand feet and paying freights; every man feels that he is in a 'catch-as-catch-can' tussle, and is doing the best he can. It is true that times are hard all round, and very little demand for lumber; but if that little were sold at what it is worth we would do far better."

THE RIVER PLATA LUMBER TRADE with this country has gained in importance during the last two years, in consequence of extensive railroad building in the Argentine Republic and the rapid increase of immigration. The shipments from the United States in 1887 comprised 76,000,000 feet of white pine, 53,500,000 feet of spruce, \$2,500,000 feet of pitch pine, and 8,360,000 feet of hard-woods. The United States needs and should have direct steam communication, regular mails and good banking facilities, and a great trade could be built up with the River Plata and other South American countries.

LOGGING IN HUMBOLDT COUNTY.—The Humboldt *Times* of a late date says: We learn from A. Bacon, general foreman of the Ryan Slough and Logging Works for McKay & Co., that last week was a busy one for the trappers, from the fact that it was the largest week's work done in the logging camp since it has been in operation, about 550,000 feet being deposited in tide-water.

SOUTHERN HARD-WOODS.—Large quantities of Southern hard-woods are crowding their way into Northern markets. Yellow pine is being shipped more largely every year, and cypress and sap are coming into more general use.

SAW MILL NOTES.

Care of Saw-Teeth.

Saw teeth should never be filed on the top side; they may receive a slight draw of the file to take off a feather edge, but good filers will never take off any metal from this part of the tooth. The roots of the teeth must, of course, be kept full, and this will naturally wear off a trifle each time from the top; but a good sawyer will preserve the line of the tooth to as great depth as he may venture to cut with a file before sending the plate to a gumming machine for spacing and recutting the teeth. It is becoming more common every day to do less filing in sawmills than was formerly thought necessary.

It is becoming more and more apparent that the steel is more valuable as a cutting medium than as a fine dust on the floor of the filing-room, and the adjuncts for keeping saws in order have of late years multiplied with rapidity.

Formerly all saws were given a spring set, and a notion prevailed that they must be set wide enough not only to clear the plate from the body of the log, but as well as to allow for the sawdust to pass from the top of the log through by the side of the plate. At that time but little thought was given to compacting the metal at the cutting point, in order to give it strength and greater solidity, and as the comparatively spongy cutting edges wore off rapidly, of course so much more filing had to be done.

When at last the fact dawned upon the mind that if the point could be made of greater density its wearing qualities would be vastly improved, it was no uncommon thing to see a sawyer sit down with a heavy and rough piece of iron, and hammer the point, spreading it while drawing it out. This was not eminently successful with many sawyers, not all of whom were expert enough to do a good job with the facilities which were within their reach. The amount of filing which was usually necessary after the hammering process was complete, was anything but in the interest of economy of saws or files.

Then came the ewage, a bar of steel about eight inches in length and one and a half inches in diameter at the large end, tapering to one inch or less at the small end, and having six or eight sides. This was of the best tempered steel, and it took a good workman to make it, and an equally good one to use it, while in a majority of cases it was the most expensive adjunct to the mill. Then the upset was invented. This is a tooth with jaws V-shaped, having a side collar which prevents the expansion of the tooth by the spreading pressure of the crown of the upper jaw, preventing the tooth from splitting while the metal of the point is compacted by driving inward, reversing the hammer and ewage process of drawing outward.

This tool has come to be pretty generally adopted, although it is difficult to find a man who does not declare his dislike to it, and if of an inventive turn of mind he is usually studying

some plan of improving it every time he sits down to use it. It is better than the swage in the hands of most sawyers of the present day, but it takes a long time to get around the circumference of a saw, and its use requires an expert. Its advantage is found in spreading the corners of the teeth to such an extent as to enable them to cut a kerf efficiently wide to allow full clearances for the saw plate in its passage through the log, without the necessity of any spring set in the tooth, while at the same time it compacts the metal and reinforces the full width of the cutting edge with an arch or shoulder, which gives strength to the point.

In the hands of an expert or fully competent man, the upset is probably the most valuable portable tool about the mill, if we except the monkey-wrench. One of the chief disadvantages, however, is found in its portability, it being necessarily too light to receive the blows of the hammer, which will compact the metal of the tooth properly without a rebound, which militates greatly against the uniform character of the work, and makes requisite a larger number of blows when one would accomplish the work to better advantage. Many inventors have racked their brains to overcome this trouble, but all have arrived at the same conclusion, that the tool which will do the work effectually must be too heavy to be portable.—*Wood and Iron*.

Great Sawmill Feat.

The Santa Cruz *Courier-Item* of a few weeks since recorded what may be considered a very extraordinary feat of lumber-sawing. According to the record, the Aptos sawmill turned out 143,000 feet of lumber from the logs in six hours.

The Aptos mill is situated on Valencia creek, near the sea-coast, and is owned by F. A. Hihn. It must be a thoroughly equipped and efficiently manned sawmill. The workmen had come to the conclusion that the powers of the mill and themselves had only been half drawn upon, and it was decided to put both to the test. That test commenced at 6 o'clock on the morning of the 14th of August. The giant logs were lifted from the pond and swung upon the carriage. The smallest did not measure less than a thousand feet of lumber, and many tallied as high as 1600, 1700 and 1800 feet. They were cut into boards, slabs and railroad ties, edged and taken care of as fast as possible. The scene was an exciting one. First, three of the logs were ground into slabs, boards, railroad ties, etc., in ten minutes. Then one that tallied considerably over 1000 feet went under the saw and came out mince-meat in a trifle less than two minutes. So it went, "without baste, without rest," till a halt was called, and the unprecedented record of 143,000 feet—sawed and stored from 125 logs in six hours—was declared amid rousing cheers. This feat was performed by 26 men, including foreman, engineer and fireman. Aptos mills challenges the State to beat this record. Does any mill dare to accept it?

In closing its article the *Courier-Item* says: The railroad took down to Aptos several thousand feet of the morning's product, which was duly shipped for Pajaro, en route to Coyote, whence it was ordered, and the next morning, in less than 24 hours from the time the lumber was in the shape of clumsy logs floating in Valencia creek, it was on the ground, nearly a hundred miles away, where it was to be used.

THE LARGEST SAWMILL PLANT in the South is now being erected at Brewton, Ala. The engine and much of the mill machinery is in position. The capacity of the mill will be 200,000 feet of lumber per day. It will give employment to over 250 men. This large mill is the property of the Peters Lumber Company of Manatee, Mich., and is situated on the line of the Louisville railroad. It went into operation August last.

SAWMILLS IN MICHIGAN.—There are nearly 1000 sawmills, small and great, in the State of Michigan, the largest lumber-producing State in the Union. The capital invested in these mills is fully \$40,000,000, giving employment to over 35,000 men. Fifty-eight sawmills and other wood-working establishments were destroyed by fire in that State during the year 1887, and about the same number built or rebuilt.

SAWMILLS INCREASING IN THE SOUTH.—It has been estimated that between 200 and 300 sawmills will be erected during the last six months of the present year in the Southern States. Pine land is being bought up both North and South, until it is difficult now to find a large tract within an easy distance of the market.

CALIFORNIA PETROLEUM.—About 400 barrels of crude petroleum are being turned out daily by the 22 wells of the Pacific Coast Oil Co. in the Pico district, near Newhall. The oil company has a monopoly of that section of the country, and it is said to have paid out from \$50,000 to \$100,000 to prevent any other wells than its own from being developed. The wells of the company are now sunk to a depth of from 1600 to 1800 feet. The oil is of the best quality obtained on the coast, and the demand for it is very great. Two more wells will be sunk soon. All of the product is shipped to this city. Many of the new manufacturers burn oil instead of coal, and as it has been proved to be perfectly safe under stationary boilers, where no great intensity of heat is required, its use in this line will no doubt be greatly extended.

COTTON AND WOOL.

Inferiority of American Wool to European Explained.

The reason why American wool will not make as fine goods as that produced in France and Germany receives this explanation in the Philadelphia Inquirer: The sheep-raising districts in this country are in cold sections; among the rocks and hills of Vermont, Massachusetts and in portions where the changes in temperature are sudden and the climate is severe. The very elements which give them health and make their meat delicious, detract from the quality of the goods spun or woven from the wool. In order to provide a suitable warm covering and protection from the inclement weather, nature provides them with a thick coat and their wool grows luxuriantly. The growth is aided by an oblongous fluid secreted in the skin, and when the wool is sheared small globules of a glutinous and a sticky nature are found adhering to the surface of the hairs. These are treated with strong alkalis to remove the excrescences; but the wool seems rough to the touch, altogether different from that manufactured in the southern cities of Germany.

Inspection of our cleansed wool with the microscope reveals ovals or crater-shaped protuberances still adhering to the hair. The alkali has destroyed the gluten, but not the hard bottom crust of the globules. Chemicals strong enough to remove these affect injuriously the crisp surface of the hairs. The epidermis is broken and destroyed in places, thus weakening the fiber and impairing the strength and flexibility of the wool. These manifest themselves in the dyeing. With all the care possible after the wool is woven into cloth there is a lack of that softness to the touch existing in the fine foreign product. The dyes will wear off first at the cup like excrescences and show a mottled appearance, and if the cups have been all removed will wear pale where the texture has been impaired by the removal. Thus American woolen cloth will not retain uniformity of color nor possess homogeneity of texture equal to the fine merinos of Germany. In order to test the matter beyond peradventure, not long ago one of our leading woolen manufacturers sent some of the best American wool to the most noted German manufactory, where it was subjected in the dyeing-house to exactly the same treatment as the German wool. The manifest difference in the outcome settled the question finally.

A New Material for Cotton Bagging.

Late advices from the East say that the emergency forced upon Southern cotton-planters by the exaction of the beggling "truet" has resulted in devising a cotton-cloth substitute for jute bagging for bales, specimens of which have been submitted to the members of the Cotton Exchange, and favorably received.

The material being made of the very commonest cotton, can be sold at a price lower than ordinary jute bagging. The manufacture of this material opens up a new and enlarged scope of usefulness for our cotton mills North and South, besides creating another factor in the consumption of the staple.

Still another cotton bagging material has been proposed. A bale of cotton was received in Washington a few weeks ago covered with pine-straw bagging. It passed all the tests satisfactorily, including that of compress. It is expected to answer all the purposes of jute bagging and can be manufactured at much lower prices.

In this connection it might be well to inquire why cotton might not be practically and economically applied to wheat bage, in place of jute. If that can be done another opportunity for trust combinations and hag corners will be swept out of the way, to the great benefit of the farmers on this coast.

In regard to the outrageous proceedings of the unprincipled "truet" combination, Andrew Gratz, a St. Louis member of the Cotton Bagging Trust, recently testified before the Committee on Manufactures that the trust made a contract with L. Waterbury, New York, who guaranteed 6½ cents per yard. Waterbury has advanced the price to 12½ cents per yard, and would have advanced it further but for his sympathy with cotton-growers—an advance of 100 per cent. It is to be hoped that the new material will be all that is expected of it. In such a case any "truet" combination would be impossible.

Cotton-Picking in India.

Carter Harrison, in a late letter from the cotton-fields of India, writes as follows:

Thousands of cotton-pickers were seen—the women, with their bright scarlet skirts and scarves, making the green fields look as if flecked with huge red flowers. The dress of the women is a cloth wrapped about the waist and falling nearly to the ankles, and then a scarf thrown over the left shoulder and caught below the waist under the right arm, leaving the right shoulder, arm and part of the back free and uncovered. When at work the skirt is caught up between the legs and fastened at the waist, making a sort of loose, flowing hippen. The laboring men and boys are nearly nude, with a short breech-cloth around the hips. I have become so accustomed to nearly naked people that

I have grown to almost admire it, and to consider this the least dress the best dress. I do not think I would now be at all shocked by the decollate costume of a belle in a fashionable ball-room in Europe or America. I have grown quite used to that sort of thing, and quote Thomson *con amore*:

Oh, fair undress, best dress! It checks no vein,
But every flowing limb to pleasure draws
And heightens ease with grace.

Frequently, as we passed near a lot of cotton-pickers, the younger ones would salute the passing cars. I noticed that my two boys invariably took the salutations of the girls as being made expressly for themselves. An oldish man relearns much forgotten human nature by traveling with two young boys.

The New Woolen-Mill at Woodland.

The new woolen mill at Woodland was recently visited by a reporter of the Yolo Mail. It was nearly ready to start at the time; the last installments of machinery had just been received from the East. The engineer, Homer Dutton, had steam up the week before and tested the driving-power of the mill. The engine worked like a charm, and he reports himself ready for business. The shafting is up and in perfect line throughout the mill.

On the lower floor the looms, ten in number, were in position waiting for their barnees, as were also the finishing and dressing machines. A wool dyeing apparatus of large capacity, to be used in winter time, is also complete. The main building and all its wings are of brick, except two sides of the boiler-room, which are of corrugated iron. The entire building is roofed with this material. The main building is 120x53 feet, and its walls are 28 feet high.

In order to pacify the insurance agent, the picker-room is built six feet from and independent of the main building. The floors of all the wings are laid in cement.

Mr. Walker, the general manager, is full of confidence and enthusiasm over the prospects of the mill. Everything has been done under his personal supervision, and he knows all will be right. He has been particularly careful in arranging for an economical and convenient working of the mill. He claims to be able to run it with a force smaller by ten men than mills of its capacity usually require.

There will be no Chinamen employed about the mill. "During the many years that I did business in San Francisco," said Mr. Walker, "I paid out hundreds of money to employes, but never a cent to Chinaman. Of course we shall have to have some experienced operators, but the largest number of the mill hands will come from families in Woodland. We shall employ 75 or 80 hands when well under way. My weavers shall be smart and nimble-fingered girls, who will be paid 'by the piece,' according to the number of yards they weave."

Mr. Walker is intensely practical in his ideas, and has not passed through a husy life without learning that the safest way is the best way.

"We are going to run this enterprise to win," he said. "We ain't going to have any high-toned, big-salaried officials around us, but we do propose to have the best skilled cloth-makers, and to put upon the market goods that will stand first in the market."

Mr. Walker said that the mill would start up as a "four-act mill," but its capacity would, he hoped, be doubled in due time, and the number of looms increased from 10 to 24.

The machinery there far purchased cost about \$12,000. It is all of the newest and most approved styles and patterns, and Mr. Walker can easily claim that for its size he has one of the best and most complete factories of its kind on the continent.

WHY CALICO WAS SO CALLED.—The derivation of this word is very interesting, as of such an ancient date is its origin. Mrs. Leonowens says in her "Travel in India" that in the year 1498, just ten months and two days after leaving the port at Lisbon, Vasco de Gama landed on the coast of Malabar, at Calicut, or, more properly, Kale Rhoda, "City of the Black Goddess." Calicut was at that period not only a very ancient seaport but an extensive territory, which, stretching along the western coast of Southern India, reached from Bombay and the adjacent islands to Cape Comorin. It was at an early period so famous for its weaving and dyeing of cotton cloth that its name became identified with the manufactured fabric, whence the name calico. It is now generally admitted that this ingenious art originated in India in remote ages, and from that country found its way to Egypt. It was not until the middle of the seventeenth century that calico printing was introduced into Europe. A knowledge of the art was acquired by some of the servants of the Dutch East India Company, and carried to Holland, whence it was introduced in London in the year 1676. It is surprising for grown-up children, as well as our young folks, to learn that "Pliny, as early as the first century, mentions in his natural history that there existed in Egypt a wonderful method of dyeing white cloth." Calico cannot be deceived when it boasts of such antiquity. The shoddy make-up of the present day may look down with contempt upon the calico dress; but what kind of lineage has it? the calico can proudly ask.

CHANGE OF BASE.—When the projectors of the Santa Rosa woolen-mill first opened that establishment, says the Sacramento Bee, 3500 to 4000 bales of wool found a market in that

town, but now not more than 50 bales are grown in that neighborhood. The disadvantages of having to look outside for wool, and then be compelled to make a market elsewhere also, thus losing no small sum in commissions to San Francisco middlemen, are apparent. Under these circumstances, the owners of the mill concluded that it would be more profitable to move the establishment to some more favorable locality. It was first proposed to go to Oroville or Red Bluff, but upon further canvassing the situation Sacramento was found to be a more favorable location. While very little wool is grown in that neighborhood, Sacramento is the chief market for wool in the interior, and shipments from Northern California have to go there first. Besides, it was argued that city would prove a fine market for the sale of much of the product of the mill. Thus Sacramento seems to overcome all the objections urged against Santa Rosa, while combining all of its advantages. Mr. Devlin is informed that the Santa Rosa people have determined to locate if the citizens will subscribe to one-half or one-third of the capital stock. The Oak Park Association has offered a block of land as a site. These mills, if secured to Sacramento, will employ 75 to 100 people, all white. The Santa Rosa mills have always paid 1 per cent per month upon the capital stock, and it is thought will do much better in Sacramento. The sum that would be needed to purchase say one-third of the capital stock would be from \$15,000 to \$25,000.

COMPRESSING WOOL FOR LONG HAULS.—The compression of wool for the purpose of lessening the cost of freight has a number of ways of solution. The usual compressed bale with iron hoops is a familiar object, but the compression of several sacks of wool together—the wool still remaining in the original package—is an innovation that has been in vogue only a short time. Montana wools are thus, to a considerable extent, forwarded to the Eastern markets at quite a saving in the cost of freight. At Fort Benton, Montana, a hydraulic press is stationed for the purpose of binding three bags together with iron ties so they shall not occupy more space than one and a half bags in their ordinary condition. The saving in freight on compressed wool is 45 cents per 100 pounds. No injury is done to the wool and its general good looks do not suffer to any appreciable extent upon its exposure in the lifts of the commission house or dealer. Very greasy wools thus treated might lose their former open appearance and sightliness when exhibited in the market.—*Cotton and Wool.*

OUR WOOL AND WOOL-MANUFACTURING INDUSTRIES.—The imports of woolen goods into the United States in 1879 were only 12 per cent of the total consumption. In other words, the domestic production of woolen goods was 88 per cent of the total consumption. In 1859 the domestic production was only 40 per cent of the domestic consumption. This illustrates, very forcibly, what protection has done for this industry. The production of wool has likewise made astonishing strides under protection. In 1859, the clip was 60,000,000 pounds, or 19 pounds per capita of population; in 1879, its clip was 232,000,000 pounds, or 4.8 per capita. Woolen goods are somewhat lower in England and other countries of Europe than here, but the American people buy and use more woolen goods every year than all the people in Europe put together. The reason is that they are better able to buy them. Matthew Arnold said that our prices are almost as low as they are in England.

WOOL GROWING NORTH AND SOUTH.—It is learned from the report of the Department of Agriculture for 1886 that during the previous year only 9,241,000 sheep were to be found in the 13 Southern States, one-half of which were in the single State of Texas; while 35,518,000 were credited to the Northern and Western States. Only about one-fifth of the whole number of sheep in the United States are found in the South. These statistics show why the free-wool proposition pinches so much harder North than South. The three Pacific Coast States, with Washington Territory, contained more sheep than the 13 Southern States—9,892,652 against 9,241,449. New Mexico has nearly as many sheep as Texas by nearly 2,000,000. These are the official figures.

BLEACHING WOOL WITH BISULPHITE OF SODA. The method of bleaching wool with bisulphite of soda, says Justus Muller, is unquestionably preferable to that of the burning of sulphur. First, no separate apparatus is required; and second, the fiber is bleached through, which is not the case with sulphur. The wool, as ordinarily, is scoured with soap, well rinsed and placed in bisulphite of soda of 20° Be., where it is left to lie for from 12 to 15 hours, after which it is passed in an unwashed condition through sulphuric acid of 4° Be.

"REFORMERS" say with one breath that the removal of the dnties on wool would give the people cheaper clothing and blankets, and in the next breath say that the price of wool is lower now (under protection) than it ever was under free trade or low duties. Oh, Reform, how many strange things are said in thy name!

SOFT WOOL is rapidly taking the place of starched lineo for many purposes.

STEAM BOILER NOTES.

A New Boiler Feeder.

In the minds of many engineers there is much objection to the use of either pump or injector as a boiler feeder, because the water is forced into the boiler against a considerable pressure. A Cincinnati engineer, John B. Winder, has sought to remedy this by a feeder from which the water simply runs into the boiler after it has been heated and purified, besides keeping the water at a predetermined height. The boiler is tipped at the height it is desired the water shall remain, the feed-pipe entering the boiler at this point. The feeder is connected with this pipe, and consists of a cylindrical receptacle adapted to contain about two gallons. A rod runs vertically through the center of the cylinder, and also through a float, which is free to move up and down on this rod, its movement being limited by two collars on the rod, one above and the other below the float. Upon the top of the cylinder is a double-armed lever, the two lever arms being connected by rods and crank arms, so that when the valve admitting water from the chamber to the boiler is open the valve admitting water to the chamber is closed, or vice versa. The rod running through the chamber boars against an S-shaped arm upon the top of the cylinder, which arm is rigidly connected to a weighted lever. If the water in the boiler is lower than the feed-pipe, steam will pass through said pipe and out under a cap into the water, forming a hot spray, which will seek a level in the boiler. The pressure thus being equal, the hot water will flow into the boiler automatically at the very instant that it goes below its proper level. When the water in the receptacle feeder has lowered so that the float rests upon the collar, the rod is drawn downward, and in so doing moves the S shaped weighted lever until it overbalances and falls upon the lever connected to the valve that admits water into the cylinder, thus opening this valve when the water is low in the cylinder, and, as they are connected, closing the connection with the boiler. When the cylinder is filled the float rises, and, striking the collar, moves the rod upward, thus raising the weighted lever until it again overbalances, and so closes the supply pipe to the cylinder, at the same time opening the valve leading to the boiler. The supply pipe need never be shut off.

For Use in the Engine-Room.

The average weight of anthracite coal is 9.35 pounds per cubic foot.
Coke (loose) weighs 23 to 32 pounds per cubic foot.

Bituminous coal weighs, per heaped bushel, loose, 75 pounds; one ton occupies 48 cubic feet.

One gallon, U. S. standard, contains 231 cubic inches; weight of water in same, 8.331 pounds; one cubic foot contains 7.4805 gallons of water.

The velocity of steam, of atmospheric pressure, flowing into a vacuum is 1660 feet per second; into air, 650 feet per second.

To find the pressure per square inch at the base of a column of water, multiply the height of a column in feet by .434.

To find the lap required on a slide valve to cut off steam at three-fourths stroke, multiply the stroke of the valve in inches by .250; the product is the lap in terms of the stroke. To cut off at two-thirds stroke, multiply by .259.

A GOOD FIREMAN NECESSARY.—Firing is only done properly when the fuel is consumed in the best possible way—that is, when no more is burned than is necessary to produce the amount of steam required, and to keep the pressure uniform. To attain this end, complete combustion must be obtained in the furnace, and this is going on when the fuel is burning with a bright flame evenly all over the grate. Blue flames, dark spots and smoke are evidences of incomplete combustion, due to lack of air. The best engineer in Christendom cannot produce the best result with his plant when he has to depend on an unskilled fireman, or upon himself, acting also as fireman. It is a common notion that anybody can shovel coal into a furnace, and that this constitutes all that a fireman needs to do. A great many cherish this idea without realizing how serious it is. No man ought to be placed in charge of a coal-pile who cannot tell approximately how much can be deducted from it, and its definite evaporative value. To speak plain, the coal-pile means just so many dollars worth of work. The duty of expending this money, this raw material, should be intrusted to a well-experienced and well-paid fireman.

BICYCLES DRIVEN BY STEAM is the latest novelty—oil is used for fuel, and it is claimed for them that there is no noise of escaping steam, or odor from burning oil. A speed of 10 miles an hour is easily attained on level ground, and enough fuel and water is carried for a run of 25 miles. The engine, boiler, and whole apparatus for a bicycle developing ½ horse power weighs 68 pounds, and is all carried in front and in sight of the rider.

It is proposed to build a 20 inch gauge railroad over the country between Prescott and Copper Basin, Arizona.

Flour Mill Notes.

The Starr Mills at Crockett.

A representative of the *Contra Costa Gazette*, who recently visited the immense flouring-mill of Starr & Co., at Crockett, writes as follows: Although no flouring machinery has been put up, a visit to the interior of the structure is not to be sneered at. In the engine-room a 200-horse power engine with a 25-foot fly-wheel furnishes motive-power for the wheat elevator, which is running steadily and elevating 10,000 sacks of grain per day. Power is transmitted to the elevator by long cables, which run at the rate of a mile a minute, and the elevator itself is constructed much like an old-fashioned pump, having buckets at intervals on an endless chain, which each lift ten pounds of wheat every revolution. At the bottom of the elevator is a large pit into which the wheat is dumped, and at the top, in the dome of the building, the wheat is delivered, after first being cleaned, into chutes, and conducted to various bins, where it is ready to be resacked for shipment. The process is simple and very interesting, and a most effective manner of getting the cereal into the upper story.

There are upward of 50 men employed about the mill at present in handling wheat and working about the engine-room, but when the mills once get into active operation in the manufacture of flour their force will be swelled to an army, and many new residences will grace the hillsides about Crockett and Valona. Many thousand sacks of wheat are awaiting shipment and vessels are continually being loaded for Liverpool. A branch railroad track runs into the warehouses and the deepest water vessel can lay alongside of the wharf to receive cargoes. The site of the mill is well chosen, and when the large machinery is placed and the mill opens up, an industry will be started that will be a material aid to the entire county.

BARLEY-GROWING IN INDIA.—The government of Madras is putting forth a special effort to encourage the growing of barley on the hills. They have issued instructions for a memorandum to be prepared detailing the description of barley required for malting purposes, and stating the method in which it can be best grown and prepared for the market. They have also intimated to their civil officers that no opportunity should be lost of impressing upon the ryots the great advantage which will result to them in the way of obtaining a ready and remunerative market for grain, if carefully grown and prepared. That the experiment will ultimately prove a success if energetically pushed there can be no reason to doubt. Last year the exports of Punjab barley from the port of Bombay amounted in value to eight lakhs of rupees, and of this three-fourths came to the United Kingdom. This trade has sprung up only in the last year or two, but it now shows every chance of proving an important and thriving industry. —*Albany Journal*.

THE MILL-BUILDING AND MILL-FURNISHING BUSINESS in the Western States is by no means as depressed as was predicted earlier in the season. New mills, says a Western cotemporary, are being built in almost every section of the country, and old machinery is being replaced by new, etc. There is not a flour-mill in operation in the whole country but what is daily calling on manufacturers and dealers in the class of goods they use for something, and the aggregate is simply enormous. It is true that some of the large establishments have the lion's share of these orders, for they have expended a great deal of labor and money in making themselves well known to the millers, both through their advertisements of various kinds and their traveling men, but the smaller dealer is also reaping his share of orders, and nearly all, as we have heard, are fairly well satisfied with the year's work so far, while some have undoubtedly sold more machinery than in any previous year.

MOROCCO AS A WHEAT-PRODUCING COUNTRY. A comprehensive report is given by Consul White on the resources of Morocco as a wheat-producing State. Mr. White speaks of the country as "a land with a future, a land now lying fallow, but which, in past centuries, exported large quantities of grain to Rome, and which will, at no very distant date, we must hope, supply an abundance of corn to the over-populated countries of Europe." Comfort will be obtained if Mr. White will bear in mind that there is no hurry, as the over-populated countries of Europe have been supplied for years with a superabundance of corn, and it will be well to hold Morocco in reserve as one of the many "future granaries of the world," till the population of the United States has become large enough to consume all the wheat grown in that country.

SUPPORT YOUR OWN INDUSTRIES.—A San Diego paper recently uttered the following very justifiable plaint: San Diego has one manufacturing establishment of which she should be proud—the Coronado flouring-mills. But she is not—at least the mills are only making 2000 barrels a week when their capacity is 5000 barrels weekly. The reason is that San Diegans are so unpatriotic as to sell more than 3000 barrels every week that are made elsewhere and imported, and the San Diego flour is confessedly as good as that made anywhere. San Diego

should get well shaken up until she will patronize home manufactures to the exclusion of any other place. Only so can she hope to permanently thrive.

ENGLISH AND AMERICAN FLOUR.—The English millers can only compete successfully with American flour by having a good supply of cheap Russian wheat for giving strength to their flour. English wheat for flavor will have rather a rough time of it presently, but will be able to hold its own if a good supply of Australian can be bought at a cheap rate. Some large London millers have already been obliged to shandon English for American wheat, which is the nearest approach to "the flavored wheat" of any grown out of England.

GAMBLING IN GRAIN.—Several Australian millers are stated to have lately joined in a petition to the Government asking that means may be taken to put down the gambling in grain, of which the Vienna Corn Exchange is said to be the theater. The petition sets forth that this gambling is not only injurious to public morality, but that it inflicts direct injury on the milling trade by subjecting their staple raw material to sudden and artificial fluctuations in value.

THE WHEAT DEFICIT IN FRANCE.—The United States Consul at Marseilles, France, states that the French wheat crop this year is estimated at 250,000,000 bushels, and that the requirements of France from other countries the coming year will amount to over 70,000,000. The consumption of wheat in France in late years has averaged about 330,000,000 bushels, annually, for all purposes. The area planted is about 17,000,000 acres.

FLOUR-MILLING IN THE SOUTH.—The Southern States are fairly waking up to a new life in almost every class of industry. It is said that 72 flouring-mills were built in the Southern States during the first six months of this year. This increase in industrial occupations will soon give our Southern brethren so much of other things to think about, that the politicians will be unable to keep up a "Solid South," as that term is now understood.

FLOUR-MILLING IN BALTIMORE.—The *N. Y. Commercial Bulletin* and the *Baltimore Journal of Commerce* have got into a dispute over the flour production of Baltimore. Unfortunately, it seems that Baltimore has a greater milling capacity than there is any present demand for, as several mills are reported idle. Idle mills are, however, by no means confined to Baltimore. They are to be found, at times, in all sections of the country.

THE EXPORTS OF FLOUR FROM THE UNITED STATES during the 12 months ended June 30th were the largest on record, viz.: 11,747,028 barrels, exceeding the total of the previous year, which was 11,329,049 barrels. In 1885-86, 8,070,504 barrels were exported, and in 1884-85, 10,373,724 barrels. About 2,500,000 barrels are shipped to the West Indies, China, the Brazils, etc., the balance finding its way to Europe.

THE WHEAT CROP OF MINNESOTA AND DAKOTA this year will, it is said, aggregate the immense quantity of 100,000,000 bushels. Allowing an average of 400 bushels to the car, this will represent no less than 250,000 carloads, or 8333 trains of 30 cars each! This shows that the railways of that region will have a prodigious amount of traffic to handle within the next few months.

A GREAT WHEAT MARKET.—The receipts of wheat in Minneapolis for the crop year ending August 31, 1888, were 47,109,490 bushels, against 39,278,380 bushels last year. This is the largest quantity of wheat ever received in any primary market in the world. It exceeds the whole wheat crop in Minnesota in 1886.

STATE MILLERS' ASSOCIATION.—The regular annual meeting of the Pennsylvania Millers' State Association will be held at Lewisburg on Tuesday, October 9th, and from the present outlook there will be a large attendance.

AUSTRALIAN AND NEW ZEALAND MILLS are being rapidly remodeled to the roller process. It is said that fully one-third of the mills in operation in those distant lands are roller-mills of modern construction.

A LARGE WATER STORAGE.—Towle Bros. are building a new reservoir in Lake Valley, 17 miles above Towles Station, for the purpose of storing water to run their pulp-mill. The reservoir will be nearly two miles long. It will be fed by one of the tributaries of the North Fork of the American river, and will store about 150,000 inches, while about 300,000 inches flow through the valley in a year. About 130 men have been working there all summer building an embankment 50 feet high and 500 feet long. From the reservoir the water will come through the old Cedar creek ditch to the pulp-mill, where 1200 inches a day are needed, but it will be necessary to use this stored water only from the 1st of July until the fall rains. The capacity of the pulp-mill is 50,000 pounds of green pulp a day, and hereafter it is proposed to run it the year round. This new storage enterprise is also stirring up the Colfax people to the fact that it is their opportunity for getting a supply of water.

Coast Industrial Notes.

THE SUTTER CANNERY.—In the labeling department at the Sutter cannery one of the employees has labeled as high as 8000 in one day. Superintendent Pratt challenges the State to produce any one who can better this record.

A TOLL ROAD.—The contract for grading the toll road from Glen Alpine Springs to the Mendocino county line has been let to J. P. Long, who was the lowest bidder. He has already commenced work and will push it through as rapidly as possible.

LIME IN SAN BERNARDINO COUNTY.—In the Mojave valley, about 50 miles north of San Bernardino, there are eight large lime-kilns perpetually burning, each having a capacity of 500 barrels of lime per day. The Oro Grande lime has supplanted Eastern lime, and is now sold in San Diego, Los Angeles, San Bernardino, Pasadena, Santa Ana and Escondido.

SANTA CLARA'S INDUSTRIES.—Santa Clara county is looming up as an industrial section. The woolen-mills at San Jose are well known throughout the Pacific Coast, and their blankets and cassimeres find a ready sale in the Eastern markets. A brewery in that town is one of the largest in the world, doing an extensive export trade with the islands of the Pacific, the Eastern States and elsewhere. There are nine fruit canneries in the county, five being located in San Jose. Santa Clara county now exports more canned goods to Eastern markets than any other county except that of San Francisco.

SPECKLES' TWO SUGAR REFINERIES.—The *Watsonville Transcript* of the 15th ult. says: Mr. Speckles, who arrived in town on Saturday evening, says that his Philadelphia sugar refinery will be in active operation by May or June next. He is as confident as ever regarding the great future of the beet-sugar industry in this country, and says that in a few days the Watsonville works will commence operations. Owing to the fact that the beets were not planted until late in the season, only 350 tons per day can be obtained, the works having a capacity of 700 tons.

CREOSOTE WORKS ON SALMON BAY.—A large plant is being put up on Salmon bay, just north of Seattle, for creosoting piles for wharf building. The works, it is said, will cost \$125,000, and will be ready for operation in about three months. The company's capital is fixed at \$1,000,000. The collapse in the Eastern & Lake Shore trestle work along Elliott bay last spring when the engine was submerged, showed how quickly the dreaded toroedo destroy piling, and so far the only preventive that has given general satisfaction is creosoting, which is strongly indorsed by engineering authorities. The capacity of the works will be 100 piles every 24 hours.

BAY CITY MILLS, OAKLAND.—The Bay City mills, owned by Samms & Westphal, located on First and Clay streets, Oakland, is the largest of any of the kind in the city. The mill and warehouse cover almost an entire block. The buildings and machinery are valued at \$70,000, and at present the amount of grain on hand is worth \$35,000. The mill has a capacity of 225 barrels of flour a day, and to do that amount of work, 35 men are employed, whose wages range from \$2 to \$6 per day. The payroll is about \$500 per week. The mill is kept running night and day to fill the demand, except for the past few days, when it was shut down to repair the machinery. It will begin operations shortly and will run to its fullest capacity.

RAILROAD IMPROVEMENTS.—The *Placer Republican* says that a summing up of the loss of snowsheds by fire this season shows a total of 4300 feet between Blue Canyon and Truckee. Nearly all of it is being replaced, but there are one or two cuts where the railroad company thinks it can keep the track clear with rotary plows. Some of the new steel rails for this division are now arriving and are being stored at Emigrant Gap. Enough rails to lay 40 miles of track have been ordered for the mountains above Auburn. They weigh 76 pounds to the yard—16 pounds heavier than the rails now in use. It will be necessary to have a steam curving machine to lay them, and when that arrives they will be put down as fast as new track is needed.

DEVICE FOR TRANSPORTING WOOD.—We take the following item from the *Sierra Tribune*, published in Sierra City, this State: On the mountain south of the river a party of Italians have rigged up a device to transport wood from the top of the hill to this side of the river. It is simply a wire rope fastened stationary at both ends and suspended in the air. The wood is fastened together in bundles by means of small branches of hard wood and a hook is formed in the same manner. The wood is attached to the wire with the hook and then in the wink of an eye the thing is landed at the bottom. This means of transportation is in general use in Italy and therefore it ought to work here.

MACARONI AND VERMICELLI.—The number of macaroni and vermicelli factories in this city has increased until there are now seven establishments of the kind here. They employ about

75 men and boys, who are paid from \$1 to \$3.50 a day, according to the class of work in which they are employed. There are now made here upward of 250,000 boxes of macaroni and paste annually, in which about 10,000 barrels of flour are consumed. The same kind of wheat raised in Italy for macaroni manufacture is also raised, of equally good character, in this State, and made into flour for the same purpose. The macaroni turned out here is pronounced by connoisseurs to be as good as any made elsewhere. The horse-power of the engines used in macaroni manufacture here aggregates only about 150, much of the work being done by hand. The value of this year's product is estimated at from \$150,000 to \$200,000.

A NEW SOURCE OF BUILDING STONE.—A company with a capital of \$100,000, says the *San Diego Union*, has been organized for the purpose of quarrying the stone on Coronado islands, which are about 20 miles from that city. The brown sandstone found on these islands is of exceptionally fine quality. Being composed of silica, alumina, lime, magnesia and iron, it is said to be particularly well adapted for ornamental and statuary work, while the presence of magnesia renders it almost impervious to the action of the weather. On the smaller island alone there is fully 58,000,000 tons of this stone, so that the supply may be said to be almost inexhaustible. This stone is said to be equal to the best on the coast, and can be worked on a good commercial basis, and shipped with advantage to every part of the State. Samples taken out and tested show that, notwithstanding the durability of its nature, it can be worked with ease at a cost which will not exceed that of any stone of its kind in America.

JUDSON IRON WORKS.—The Judson Iron and Nail Works at Emeryville, or Berkeley, is a very large institution, and gives employment to a great number of men, boys, and girls. The men and boys work in and about the shops, some being skilled mechanics and others assistants and laborers. The girls are employed in lighter duties assorting and boxing the nails. On an average the establishment employs 475 people, whose pay ranges from \$1.50 to \$4 a day, and the expense for salaries alone will aggregate about \$18,000 a month. The buildings of the various departments cover an area of 13 acres, the rolling-mill being the largest. A specialty is made of boiler iron, bridgework, castings, machinery, tanks, and nails, and shipments of from 40 to 50 tons are made daily. About 100 tons of material is worked up. The whole of the machinery used in the works is made by them. Work has been rather slow in the past few weeks, and nothing out of the usual order has been done. The trade they supply is mostly through San Francisco, Sacramento, San Jose and Stockton.

NEW RESERVOIR.—The *Placer Republican* says: Towle Bros. are building a new reservoir in Lake Valley, 17 miles above Towles Station, for the purpose of storing water to run their pulp-mill. The reservoir will be nearly two miles long and is on Sections 35 and 36 of T. 17 N. R. 12 E. It will be fed by one of the tributaries of the north fork of the American river, and will store about 150,000 inches, while about 300,000 inches flow through the valley in a year. About 130 men have been working there all summer, building an embankment 50 feet high and 500 feet long. From the reservoir the water will come through the old Cedar creek ditch to the pulp-mill, where 1200 inches a day are needed, but it will be necessary to use this stored water only from the 1st of July until the fall rains. The capacity of the pulp-mill is 50,000 pounds of green pulp a day, and hereafter it is proposed to run it the year round. This new storage enterprise is also stirring up the Colfax people to the fact that it is their opportunity for getting a supply of water. Its use at the pulp-mill does not diminish its volume, and here is an unlimited supply of water which may be had by bringing it from Gold Run down.

PACIFIC IRON & NAIL WORKS.—At the Pacific Iron & Nail Co.'s Works, First and Market streets, Oakland, from 175 to 250 men and boys are employed, and the monthly payroll is about \$20,000. Laborers are paid from 75 cents to \$2.50, and skilled mechanics from \$3 to \$6 per day. The company imports the steel plates used in making steel nails direct from Belgium, England and Scotland, and get scrap iron from all parts of the world. Most of the coal used is from Australia, and 10,000 tons had just arrived. There is now stock on hand about ten months' supply of coal and material. All the locomotives, cars and schooners used in transporting the materials and products are owned by the company. The Pacific Coast trade is supplied by them through agencies in Salt Lake City, Los Angeles, Portland and San Francisco. The company is continually making improvements and will shortly begin the erection of a \$60,000 wire plant on the site formerly occupied by the old glassworks, and it will be in operation in about 60 days. The manufacture of wire will become a prominent feature of these works. This new department will necessitate the employment of about 60 additional men. For the number of days worked, the amount of work produced, and the money paid out, the company could be classed as the heaviest manufacturers in Oakland.

Something About Elevators.

NUMBER II.

There are very few buildings which an elevator of one kind or another would not increase the rental value of; even a block and a fall is preferable to the old style of carrying heavy goods up and down steep flights of stairs. That an elevator is indispensable to any building which is to be used for merchandise, offices, hotels or factories, etc., is proved by the fact that it is very rarely such a building is now erected without one.

By the use of a power elevator the objections to great height in office-buildings, hotels, etc., are completely obviated, and the upper floors are thus for many purposes made even more desirable than lower ones, as complete seclusion and quiet are particularly acceptable to lawyers, architects and others whose business does not require display. Hence in buildings which are provided with quick, easy-riding, safe and reliable passenger elevators, an active demand for rooms invariably exists. In purchasing an elevator, whether for freight or passenger traffic, next to the question of class should be the quality, price, durability, economy and safety, etc. There are in this business, as in most others, some worthless imitations which will assuredly prove costly and an ultimate cause, sooner or later, of disappointment.

Our illustration shows Messrs. A. J. McNicoll's & Co.'s patent hydraulic elevator. In this patent any number of ropes may be used, and the strain on all will be perfectly equal; if one breaks the others will hold without it, and it can be repaired at leisure. The spiral grooves in the drum are made in pairs, so that the pairs of ropes from each pulley will be close together when the yoke is farthest from the drum, and will coil outward from each other so as to lie nearly parallel.

The elevator pulley is secured to this drum shaft, and consists of two different sized wheels provided with a device for shifting the rope which hoists the cage, so that for light loads the rope may be coiled upon the large pulley and thus hoist the cage to its highest point with a movement of the piston through only a small part of the length of the cylinder and a consequent decreased supply of water.

When a heavy load has to be raised, the rope is allowed to coil upon the smaller pulley and the piston then traverses the full length of the cylinder.

The pipe by which the water escapes from the cylinder has a patent relief valve, and the pipe of the valve itself has an extension which draws up any water which leaks into the tank in the manner of an injector.

The doors on this elevator cage are worked automatically, which prevents the danger of their being opened at improper times, while they are always opened when the cage arrives at the landing.

The safety attachment is unlike that of other makers. Heretofore it has been the practice to connect the hoisting rope with the meeting ends of the levers, so that the pull of hoisting the cage would draw them up and keep their pointed outer ends inside of the upright timbers; but this rendered the operations of the dogs uncertain, as the rope would often break on the opposite side of the suspending pulley, in which case the spring would not be able to overcome the weight of the rope, and even when the rope broke close to the cage the weight of the rope would be sufficient to prevent the working of the dogs.

Mr. McNicoll's patent consists in compressing the spring and securing the meeting or jointed ends of the dogs in their set position by means of a hinged pin or latch.

A wheel is mounted upon the cage so that its rim will bear against one of the two upright guide timbers between which the cage moves, so that the travel of the cage and the friction of the wheel-rim moving against the upright timber will cause the wheel to rotate with a speed corresponding to the movement of the cage.

To prevent unpleasant vibration and insure smooth running, a wheel is also placed at the opposite end of the timber so that it will press against the opposite upright guide timber. The faces of both these wheels are covered

Nicoll's patent elevator cage in position ready to leave the landing. On the top can be seen the two hoisting cables, the balance-weight ropes and patent double-acting safety catch. Any further information may be obtained from the proprietor of the patents, at the works of Messrs. A. J. McNicoll & Co., 118 Main St., San Francisco.

Messrs. McNicoll & Co. also manufacture a patent hydraulic store elevator, a worm-gear belt elevator and a hand-power and sidewalk elevator, besides a large number of direct-acting vertical pipe rams, with many important and modern improvements.

The new air compressor being erected at the Anaconda mine, M. T., is said to be the largest

work of late. The Hazleton boiler, which this firm has introduced so successfully on this coast, has kept this department of their works running with full force since the beginning of the year. The 800-horse power plant of the Spring Valley Water Co. pumping station at Belmont has just been completed and put in successful operation, as has also the 600-horse power plant of the Pacific Coast Sugar Co. at Alvarado. One hundred-horse power boilers have also recently been furnished to the California Wire Works, the boot and shoe factory of Buckingham & Hecht and Frank's tannery at Redwood; also a number of smaller boilers for various mines in Mexico and Central America.

In the way of mill machinery, these works have under construction a 60-stamp mill for the Amador mine, in Amador county; power to be supplied by four Pelton water-wheels. A No. 4 Gates crusher of capacity of 200 tons per day is also a part of its equipment. There seems to be a large and growing demand for this crusher. Though only introduced on this coast some six months ago, numbers are already operating in various parts of the country with very satisfactory results. It is claimed that the capacity of a mill is largely increased by their use, from the fact of their fine crushing, thus relieving the stamps of their heaviest work.

Pelton Wheels.

The Pelton Water-Wheel Co., now located at 120 First street, reports a very active business in their wheels, many orders coming from South Africa, England, Australia and other distant localities, as well as from all parts of this coast.

The system of electric transmission, now coming into so general use, greatly enlarges the scope of operations, making it possible to use water-power over a large extent of country, where either from lack of head or other insurmountable difficulties it could not heretofore be availed of. The great economy, as well as the many other advantages of water-power in mining operations, are beginning to be better understood, and it will everywhere be more largely availed of hereafter.

Agricultural Title to Mineral Lands.

NUMBER III.

There is another class of agricultural settlers on mineral lands, who do more harm to the mining interests, and so to the general prosperity of the country, than those who fraudulently acquire title in order to mine or sell for mining purposes.

This is the class that merely takes up the 160-acre homestead because they practically get the land for nothing. Perhaps not over 10 acres at most in each homestead is fit for cultivation. The rest is mountainous and only valuable as mining ground, but the owners never attempt, themselves, to mine (unless it be for wages), and the land once passed out of the public domain is shunned by the prospector. Thus much valuable land is absolutely wasted, though unquestionably it is of great interest to the entire country that lands containing the precious metals be reserved for mining purposes, and all legitimate encouragement be given to mineral development.

Many instances could be cited where the rulings of local land offices are oppressive in discriminating against the miners, though why the mining laws should be interpreted in the interest of a class who ostensibly have nothing to do with mining, it is difficult to see. It is undoubtedly the intention of the law to protect mining ground for mining purposes, and at least such safeguards should be applied as will promptly stop the frauds now practiced and not throw the burden of protecting the public domain upon individual miners, who in so doing must suffer great expense in the manner which has been explained in previous articles.

In investigating the workings of the present mining laws in California, two things are clearly seen:

1st. The laws, as at present interpreted in the local land offices, make it far less difficult and expensive to acquire title to 160 acres of mineral ground by homestead or pre-emption than to acquire title to only 20.65 acres of the same character of ground by means of a mining patent.

2d. The laws should be such as to make the acquisition of mining titles more simple and expeditious and less expensive than now. This could be done, and at the same time the Government receive double or more per acre than at present. Whatever can be done in this direction cannot fail to stimulate mining, add to the output of the precious metals, and so be of benefit to this State and to the entire country,

A. J. McNICOLL & COMPANY'S PATENT HYDRAULIC ELEVATOR.

with india-rubber to increase friction and insure rotation.

The wheel on the right-hand corner [see illustration] is constructed with one or more radial slots; in each slot a weighted arm is suspended. The jointed ends of the dogs are connected with two guide rods which pass through eyes on the side of the crossbeam. Now, when the cage moves at its ordinary or proper speed, the wheel will rotate at a corresponding rate of speed, and the hinged arms will drop to the center as they are carried around the upper half of the wheel, and drop toward the circumference as they pass the lower half. They thus miss the projection on the lever, but should the rope break, or should the cage attempt to move downward at an unusual rate of speed, the increased rotation of the wheel will cause the arms to fly out and strike the projection and force it to one side, thus unhooking the latch so that the hinged bolt will swing down and free the dogs. The spring will then force the dogs down so as to dig their outer sharpened points into the guide timbers and thus stop the cage.

Our illustration shows the interior of Mc-

nicoll's patent elevator cage in position ready to leave the landing. It occupies a space 25x60 feet. The fly-wheel alone weighs 30 tons, and each of the hack cylinders weighs 16,250 pounds. It is placed on a solid foundation of granite 12 feet deep.

Foundry Notes.

The Risdon Iron Works have cast three of the 15 cast-iron columns for the tower of the New City Hall. These columns are 35 feet long and weigh 30,000 pounds.

In the erecting-shops are the compound Corliss engines for the Los Angeles Cable Railroad Co., more powerful and more economical in working than any of the driving engines of our city roads.

The new engines and Corliss for the steamship Australia will soon be under way. The boilers are for 160 pounds working pressure and the engines triple expansion. The Risdon Iron Works have guaranteed an increase of 2½ knots per hour in the Australia's speed on a coal consumption of 12 tons less than now being consumed.

The Pacific Iron Works have been turning out an unusual amount of mining and milling

1850. 1888.

MARKET REPORTS.

Local Market.

SAN FRANCISCO, Oct. 11, 1888.

SILVER—The market in London and in New York has ruled easy throughout the week. The demand abroad was good in last month, but it is now said to be only fair for the season. In our market trading has been light; buyers bid down, but holders, so far as we can learn, do not entertain any bids below 94c. At the latter figures some transactions are reported for export. Since the shutting down of the mills in Virginia City, Nevada, that were running on ore from the Savage, Hale & Norcross and Confidence mines, the receipt of silver fell off, but with an increase at an early day in the supply of water in the Carson river the mills will be again in full operation, when silver from that section will begin to come in more freely. It is claimed by those in position to know that the work going on in several of the leading mines on the Bonanza lode is of such a nature that it will undoubtedly develop the positive existence of a lode to the west of that now being worked. This lode, called the Red lode, is chiefly if not entirely gold-bearing, which with further work calculated to take out ore will have an important bearing on the mining and silver industry; for gold instead of silver will largely predominate and new mines come to the front as large producers. In British Columbia, Montana, Idaho, Arizona and Colorado there has been no material increase in the silver output, but from Mexico more bullion has been received in this country.

The following table shows the amount of silver bullion in the principal European banks Sept. 20th, and at the corresponding date last year:

	1888.	1887.
Banks of France	\$49,234,560	\$47,829,794
Germany	15,646,000	15,606,000
Austria-Hungary	15,330,000	14,488,000
Netherlands	7,703,000	8,168,000
Nat. Belgium	1,271,000	1,250,000
Nat. Italy	1,116,000	1,101,000
Totals	\$90,199,560	\$88,469,794
Totals, previous week	\$90,649,296	\$88,644,448

The above shows an increase of nearly \$9,000,000 during the 12 months, with the Bank of France being the chief gainer.

QUICKSILVER—The market shows another slight decline, with a weak tone at the close. In last month the price here ruled at \$37.25 up to the 10th, when in sympathy with an upward move abroad it was advanced until by the 14th it reached \$45, at which price it continued through the month. The heavy shipments, 11,229 flasks, in last month was the leading feature of the export movement. China's fresh purchases were probably due to this market being \$2 a flask below the London parity. The receipts of California quicksilver at this port last month aggregated 2330 flasks, and for the first nine months of the year 19,236, against 17,949 flasks for the like time in 1887. From January 1, 1888, to Oct. 1, the exports in flasks were as follows: To New York, 2320; Mexico, 4253; China, 3536; New Zealand, 276; Central America, 323; Japan, 10; British Columbia, 8; Australia, 25. Total, 11,021 flasks against 9999 flasks for the like time in 1887.

IRON—Imports since Jan. 1, 1888, aggregate as follows: 1095 tons American pig and 14,000 tons English pig. Besides the above there were received 7500 tons of old railroad iron, 1050 tons of nail slabs and 9474 tons of scrap. The market continues strong under a good consumptive demand. The imports go into consumption about as fast as received. Scrap iron is reported very strong at \$26.

LEAD—The New York market, the past week, was subjected to lively fluctuations, with prices gravitating to lower figures. In our market holders are firm in their advanced views, but buyers are reported to be offish; only buying for immediate use. The decline at the East is said to be owing to the October sales having been filled. A white-lead trust has been formed at the East which may have an influence on the lead market.

TIN—Pig in first hands is about exhausted. Tin plate on spot is dull and easy. For both pig and plate to arrive trading continues free, with sales of the latter to the extent of 50,000 boxes, ranging from \$4.95 to \$5.15. The latest reported sale to arrive was 1000 boxes of coke, at \$5.15 to an Alaska cannery.

BORAX—The market continues strong, with shipments reported to be going forward to the East.

ANTIMONY—The market continues to rule very strong in sympathy with the higher markets reported at the East. The demand is only fair, as the advanced prices restrict, somewhat, the inquiry.

COPPER—The market is reported to be quiet at unchanged quotations.

COAL—The market continues very strong, owing to importers not wishing to submit to any concessions. From a very general inquiry we are convinced that consumers are better stocked than at any time for several years past. This they did as a precaution against either a probable corner or a scarcity, owing to lessened importations from Australia. With this the case, the demand this winter will at no time be of an urgent character, while the buying will be less than last winter. A large consumer was offered and refused a cargo of Australian for prompt shipment at a slight concession.

Eastern Metal Markets.

By Telegraph

NEW YORK, Oct. 10, 1888.—The following are the closing prices the past week:

	Silver.	Copper.	Lead.	Tin.
Thursday	94 1/2	\$17 45	\$5 00	\$22 20
Friday	94 1/2	17 50	5 10	22 30
Saturday	94 1/2	17 50	5 00	22 30
Sunday	94 1/2	17 50	5 05	22 25
Tuesday	93 1/2	17 45	5 30	22 15
Wednesday	93 1/2	15 16 1/2	35 40	22 25

The market closed as follows: Lake Ingot copper seems to be entirely in the hands of the combine and the rein has been pulled rather tighter upon consumers. The quotations are 17 1/2 c for the best and 16 c for casting brands.

Pig lead, weak, lower and easy. Quicksilver is quotable at \$50.00 and 3/4. Borax is active at an advance. California refined

is quoted at 8 1/2 @ 8 3/4 c; concentrated, 7 1/2 @ 8 c, being the inside figure for car lots. Tin is dull, though a shade higher. Tin plates are steady and more active.

By Mail.

The following is the latest from the "New York Metal Exchange Market Report":

TIN—Total sales are only 30 tons, although the metal evidently is a subject of interest to most of the traders, judging from the general attention given the calls. Fluctuations in price have followed less closely those of the market from abroad; London ruling on the whole lower, while we have made a net advance of a quarter cent on futures. Spot showed a corresponding gain, but has been relatively more irregular and lost 20 points from the highest.

COPPER—Is still utterly stagnant, but one sale being reported during the week, and the only fluctuations being due to neglect of those supporting the market to raise their bids to the usual level.

LEAD—Trading has fallen off to total of a trifle over 450 tons, though this metal still commands more attention than anything on the list. Prices advanced 5 to 10 points on spot and 15 to 20 on futures, but fell off again from 2 1/2 to 10 points toward the end; recovering again to-day and closing strong and fairly active at a net advance of 10 to 20 points for the week.

SPELTZ—Opened five points higher and fully maintained the advance in spite of the usual apathy in regard to this article; gaining yesterday a fraction more and closing to-day quiet and steady.

Prices generally ruling for metals not regularly dealt in on Call at the N. Y. Exchange, covering extremes of buyers' and sellers' views. All prompt delivery, Australian Tin, @—; Biliton Tin, @—; Banca Tin, @—; Baltimore Copper, \$16.05 @—; Orford Copper, \$16.00 @ 16.25; P. S. C. Copper, @—; Foreign Lead, \$5.00 @ 5.25; Foreign Speltz, \$5.40 @ 5.50; Antimony, \$9.75 @ 13.50.

The Philadelphia market is reported as follows by the New York Metal Exchange Report:

PIG IRON—The market is firm, but not specially active, although a good many orders would be placed at about the old figures, but buyers do not like paying the advances which are now generally demanded. Meanwhile the entire output goes direct into consumers' hands so that for the present furnaces have little iron to offer.

MANUFACTURED IRON—A great deal of business has been recently taken, and the bar-mills are particularly crowded with orders. Plates and shapes have not sympathized to any great extent as yet, but the entire market is regarded as being in a most healthy condition, and prices are firm all the way through.

OLD RAILS—Buyers at about \$24, but there are none for sale to meet consumers' requirements.

SCRAP IRON—Sales of cargo lots No. 1 at \$24 ex ship. Other descriptions firm and in good demand.

Mining Share Market.

It remains to be seen whether stocks can be kept up when the Carson river mills run all their stamps and when all the mines are able to resume operations on the lower levels. The Virginia Enterprise thinks the time is near at hand when there will be supporting props to place under stocks when they are lifted. The shafts, drifts, and all the openings, and all the apparatus of the leading mines will be in better shape when they resume work than before for many years. Not only has all been put in good shape underground, but the surface works and machinery have been thoroughly overhauled. Much new ground has been explored and opened up ready for mining during the past three months, and there will be no lack of ore when the mills can be started up.

With plenty of water there will be more stamps than can be put in operation than before in some years. If water is abundant in the Sierras the Virginia & Gold Hill Water Co. can send through their three big pipes enough to supply the Pelton wheels at both the Nevada and California mills. This would give 140 stamps in Virginia City. Certainly a more economical use of water can be made in no place in the world than when every mine connected with the Sinto tunnel is in possession of from 2000 to

2500 feet of fall, which allows of a head of water being used over and over by means of Pelton wheels placed along down the shafts at intervals of from 400 to 500 feet.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in Dewey & Co.'s Patent Office Library, 220 Market St., S. F.

FOR WEEK ENDING OCT. 2, 1888.

390,331.—STOCK CATCHER—F. M. Able, Rocklin, Cal.

390,209.—BUTTON—F. B. Crooks, Los Angeles, Cal.

390,474.—SPRAY NOZZLE—Greene, Crofton & Greene, Oakland, Cal.

390,606.—PRESSER FOOT FOR SEWING MACHINE—Crapo, Leak, S. F.

390,305.—ORCHARD CULTIVATOR—John Morgan, Santa Clara, Cal.

390,249.—EXPLOSIVE SHELL—E. Paulson, Astoria, Ogn.

390,319.—BRACING FOR WHARVES—Thos. Thomson, S. F.

390,427.—LAWN SPRINKLER—J. S. Woolsey, Gilroy, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

LAWN SPRINKLER.—John S. Woolsey, Gilroy, Cal. No. 390,427. Dated Oct. 2, 1888

This sprinkler is of the general "Barker's Mill" type. There is a vertical stand-pipe having a coupling for the hose. On top is a cylindrical head having a tapering vertical hole extending axially through it and fitting a correspondingly tapering shaft at the top of the stand-pipe. Chambers are formed at each end of the cylindrical head to receive packing, and a peculiarly shaped angular or conical chamber around the center of the interior chamber corresponds with transverse holes made in the sleeve upon which it turns, so that water is admitted from these holes into the bent perforated arms which project outwardly from the rotary head, and are provided with holes or openings so as to rotate by reactionary force of the escaping water and distribute it over the ground.

BRACING FOR WHARVES.—Thomas Thomson, S. F. No. 390,319. Dated Oct. 2, 1888. This novel bracing is adapted especially for wharves where the depth of the water is such as would affect the stability of the structure, or where the water may be unusually rough. The essential feature of the device is a brace rod having a nut and washer on its upper end for securing it to the top of the wharf, and a peculiar clamp loosely jointed to its lower end and adapted to be fastened to the pile at the ground line. Protecting plates are put between the clamp and pile to avoid injury to the latter. In applying the brace rod it is connected to the pile before driving it, and the rod being hinged to the clamp may be turned to the most convenient position during driving. Then when the wharf is complete the rod is turned to the required inclination and added to or cut off to bring its upper end to the proper fastening point.

Scientific Press

Patent Agency.

ESTABLISHED 1863.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us offer to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St. S. F.

\$1,000 CHALLENGE ACCEPTED, PRICE, FIVE HUNDRED AND FIFTY DOLLARS (\$550.00).

THE
"TRIUMPH" ORE CONCENTRATOR.

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering each letter of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

JOSHUA HENDY MACHINE WORKS,
Nos. 39 to 51 Fremont St., San Francisco, Cal.

COMPRESSED AIR and WATER POWER MACHINERY.

RIX & FIRTH, 225 and 227 First St., San Francisco.

NATIONAL AIR COMPRESSORS.

FROM 2 TO 100 H. P., ALWAYS IN STOCK

MILL SUPPLIES AND LUBRICATING OILS.

DOUBLE "ECONOMIC" STAMP MILL.

We have here the Stamp Mill in a cheap and simple form. The high drop of the old stamp is more than compensated for by the great weight (1200 lbs. each) of our stamps, and the rapidity (300 strokes each per minute) with which they run. There are 4 shoes in each stamp, so that there are 4800 strokes of the shoes on the dies per minute. Less power is required than in any other mill to do the same amount of work.

The Mortar has screens at both ends, giving ample discharge. There are no cams or tappets to wear or be adjusted. The stamps adjust themselves as the shoes wear.

AN AUTOMATIC ORE FEEDER

Goes with each Mill. We also have a suitable

Rock Breaker.

Several Mills are now in the mines doing excellent work. The "Economic" is not only a mill for small mines, but we believe it is destined to SUPERSEDE THE OLD STAMP IN MILLS OF THE LARGEST CAPACITY.

TATUM & BOWEN,

34 and 36 FREMONT STREET, SAN FRANCISCO, CAL.
Manufacturers of Mining and Sawmill Machinery, Engines, Boilers, Etc.

THE RAND DRILL COMPANY, 23 Park Place, New York.

We are now so situated with our new works as to offer to the miners of the Pacific Coast SMALL AIR-COMPRESSING PLANTS at such prices that almost any small mine can afford to put in power drills if they have none in use.

By our NEW AND PATENTED SYSTEMS (by which the duty or performance of drills is not reduced with use) it is no longer necessary PLANTS IN THIS COUNTRY, and has patterns for all sizes up to 10-inch diameter of cylinder.

In respect to capacity IN SPEED OF DRILLING, perhaps it is in order to say that in EVERY AUTHORITY CONTEST for speed yet initiated, the RAND DRILLS have, without exception, BEEN VICTORIOUS. This fact, coupled with another important one, that the drills use much LESS AIR and cause LESS REPAIRS, has won for them nearly all of the Eastern mining trade, which has kept their works always busy.

Since the reasons which formerly restrained us from the California market no longer exist, we are now in the field for the business.

SPECIAL ATTENTION is called to the latest designed sectional Compressor just built for the Batopilas mine in Mexico, and to the Compound Engine Compressor built for the Anaconda mine in Montana.

Alien Mine-Owners.

The subject of alien ownership of mines is to be investigated and reported on to Congress. It will be remembered that when the Alien Land law was passed it was so worded that it prevented foreign individuals or companies from acquiring, in any way, mining property in the Territories of the United States. The mine-owners and prospectors in the Territories strongly objected to this, as they were debarred from selling to a class of people who had always been liberal buyers, and who really advanced the mining interests to a large degree. Petitions were sent to Congress, and finally a bill passed the Senate amending the Act so as to omit the mines, thus permitting aliens to purchase mines in the Territories. The bill went to the House, where it is still pending. To remove the apparent misapprehension of the object of the bill, a resolution was introduced in the Senate instructing the Committee on Mines and Mining to ascertain the number of aliens and foreign corporations owning mines in the Territories, the length of time they have been so engaged, the amount of capital invested, dividends paid, and the effect that such ownership has upon the growth and prosperity of the Territories.

It was decided to appoint Senators Mitchell of Oregon and Stewart of Nevada a special committee to investigate the question. It seems rather strange that California, the oldest mining State, was not represented on this committee, especially as one of its Senators has a thorough knowledge of mining matters and is one of the richest and largest mine-owners in the United States. We see there is some little wrangling because two Republicans were appointed and no Democrat. But this is in no sense a political matter, and the political complexion of the investigating committee can have no effect one way or another. The fact is, the people of the Territories know better what they want and what is good for their interests than Congress does. If they want the privilege of selling their mines to the highest bidder, whether home-born or alien, they ought to have it. Under the present laws, foreigners cannot patent mining ground, and as foreign companies will not buy unless the ground is patented, some citizen is sure to make the sale. The foreign companies pay good prices, develop their properties, put up reduction works, employ many men, and always pay their bills. Where

ever they have taken hold of mining property in this country they have benefited the camp and surrounding region. This the Senate Committee will find to be the case in the course of their investigations.

THE NEVADA QUEEN.—From the annual report of the Nevada Queen mine of Tuscarora, Nev., it is seen that 913 tons of ore have been shipped to the mills, which amount has been milled, yielding a product in hullion of \$162,735.09 besides about \$20,000, estimated value which still remains in the mill, no cleanup having been made. The greater part of the ore

PLATINUM STILL PLANT FOR THE MANUFACTURE OF SULPHURIC ACID.

milled during the past year, excepting about 300 tons from the 200-foot level, was taken from the 350-foot level. There are about 6000 tons on the dumps at the mine, most of which was extracted from the 350-foot level stopes. The average assay, as taken from car samples, gave returns of \$26.39 per ton. The concentrating plant is about finished, and can be started about November 1st, or as soon as the Water Co. can furnish water. The erection of the new mill is progressing very favorably. The increased facilities, available in the coming year for treating the ores, will greatly assist in the economical reduction of the large ore reserves now in sight.

THE CRESCENT MINING CO., Utah, received from ore sales last year \$187,989. The work of the concentrator has been very satisfactory during the past year, having worked 20,000 tons of second-class ore at a fair profit to the company. The statement of work for the year ending Sept. 30, 1888, shows that the main shaft was sunk 123 feet; inclines, raises, crosscuts and drifts, 2514 feet; and there are 7550 cubic yards of stoping taken out, and for excavations for stations, 6736 cubic feet.

A MINER'S Union has been organized at Granite, Montana, with 200 members.

Sulphuric Acid.

The manufacture of sulphuric acid is now a gigantic industry. In this country alone the production has increased from 60,000 tons in 1867 to 450,000 tons in 1887. The present increase in manufacture of this acid in the United States is almost wholly from pyrites ores, which we have in almost unlimited quantities. The largest consumption for such acid is for the treatment of other native products—petroleum, rock phosphates, etc. W. H. Adams of N. Y. read before the American Institute of Mining Engineers a paper on "Twenty Years' Progress

Livermore Coal.

The existence of coal near Livermore, Alameda county, has been known for many years, and some little mining was done there a long time ago. It is not, however, until within the past year or so that active operations of any magnitude have been carried on. The coal is "soft," like all that has ever been found in this State, but answers very well for most purposes. The company is now about to erect hoisting-works on the Pen Darien incline on the Summit mine. The incline is down 100 feet in an eight-foot seam of bituminous coal.

At the Richards incline coal has improved 10 per cent in quality in the last 50 feet. This company has also purchased all of W. T. Coleman's coal lands, some 2340 acres, and work will be commenced on the Eureka and adjoining mines this year.

It is stated that as soon as the company is in a position to ship 200 tons a day regularly a railroad will be built from Livermore to the mines, the estimated length of the road being 10 miles. An organization has already been perfected known as the Livermore Valley R. R. Co., with a capital stock of \$1,000,000. The

directors are J. N. Knowles, Israel Lawton, I. W. Taher, F. Danham, D. Guttman, Geo. W. Comegys and B. Noyes.

QUICKSILVER FLASKS.—The well-known "A" brand of quicksilver is shipped direct from the New Almaden mine, Santa Clara county. The trademark "A" on top of the flasks is secured by U. S. patent, and registered. Flasks contain 76½ pounds of quicksilver. Foreign quicksilver is sold in flasks containing only 75 Spanish pounds, equal to 76.07 pounds avoirdupois or 43-100 of a pound less than is contained in flasks of "A" brand. Foreign-made flasks are undersized, badly made, and not fit for second use. The brand referred to above is put into American flasks, which, when empty, can be sold readily at ruling market rates. The advantage is largely in favor of the purchase of American quicksilver at equal price.

THE GRANITE MOUNTAIN MINING CO. of Montana paid a dividend of \$200,000 on the 10th, making \$1,400,000 this year, and \$5,200,000 in all. With the exception of the Calumet and Hecla copper mines, Lake Superior, this is the largest amount paid by any American mine this year. The last-named mine has paid so far this year \$1,500,000 in dividends.

in the Concentration of Sulphuric Acid," in which he sketches the gradual growth of the business and the changes in the apparatus.

In this paper he gives a sketch of the largest and most successful plant in the United States, shown in the cut on this page. Foreign-made stills and pans of varying dimensions are well known here, and the cut shows a plant of the most advanced type of shallow-basin platinum stills and their accessories. The plant as shown has a capacity of 500 carboys—say 80,000 pounds—daily, and the fuel and labor costs are very low. Outside of the deterioration of plant, or waste of platinum, this construction with gas firing guarantees the best results yet known for commercial acids of 66° Beaume.

GEORGE ROBERTS, inventor of the steam track-layer, has received a contract to lay 35 miles on the Northern Pacific Short Line from Cheney west toward Ellensburg, W. T., this fall. Roberts is now preparing a machine to go to the scene of operations.

KNIGHT & CO.'S foundry at Sutter Creek, Amador county, is now quite busy. They have now in course of completion four water-wheels, and are also building a 10-stamp mill to go to Placer county.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

Mining in Sonora, Mexico.

EDITORS PRESS:—As you intimate a desire to get intelligence from this quarter of mining operations in progress, I inclose the following, which may interest.

The first item, perhaps, of which mention should be made is that the mine-owners and superintendents of mines of this State are to have a convention in this city, on Oct. 21st, to discuss the situation, form an association, and take such concerted action as may seem to be required for mutual advancement and for bettering the condition of the industry in the State. Incalculable benefit will result if wise and prudent counsels prevail. This seems to be assured because of the prominent persons whose names appear in the call which is headed by the acting Governor, the second name being the representative in the Federal Congress for the State. The other names are well known in this section.

There is a great field for such an association to work in, and there is no doubt in the minds of those who know that much aid can be rendered to the Government through its efforts. I inclose the call.

The Federal Government has granted seven or eight mining concessions to various parties in the State, all on the same general terms. By the contracts, which run ten years, with a forfeiture placed in the hands of the authorities to insure compliance, the parties receiving such concessions are obliged to explore or prospect their claims, which are generally about 12 by 18 miles in extent, and inside of five years to invest \$225,000 in working the same.

They are obliged to keep some 30 or more men constantly at work, to erect proper reduction works and reduce at least three-quarters of their ores in Mexico.

At the end of ten years the conceded territory, i. e., the mineral it contains, reverts back to the Government with the exception of the mines worked by the parties holding the concession. The titles of these last-named mines will be given in precisely the same way as the Mining Code now provides for, and after the ten-years' limit has expired they are held under the same regulations in every particular as other mines.

The contracts already published call for the investment of over \$2,000,000 inside five years, and this is sure to produce activity here and make money circulate. There will be very little opportunity to avoid compliances with the terms of these contracts, as they are under the supervision of the prefects and officers appointed especially to look after them.

Remarks have been made in various ill-informed quarters in the United States derogatory to the principle under which these concessions are given and their terms, but for my part I consider that the result is sure to be beneficial and give a permanent impulse to mining matters in the country.

I will give you a more general letter next week. HARRISON.

Hermosillo, Sonora, Sept. 20th.

Following is the circular referred to:

HERMOSILLO, SONORA, Sept. 17, 1888.

Dear Sir:—You are hereby cordially invited to attend the convention of mine-owners and superintendents to be held in the city of Hermosillo on Oct. 21st proximo, when a mining association will be formed and matters of great importance to all engaged in mining discussed.

Acting Governor, Ramon Corral, Prieta mine; Congressional Representative, Rafael Izabal, Noche Buena; Antonio Calderon, Las Guijas; Ricardo Johnson, Grande (Moctezuma); C. Rueda, Almagro; E. A. Price, Creston; Jno. R. Magruder, Yaso; James D. Fresh, La Gloria; E. H. Hathaway, Las Delicias (St. Helena); L. W. Tatum, San Ricardo; C. F. Bergen, Ahogada; Schulze & Pletz, Chipionena; Francisco E. Rodriguez, California; J. E. Jackson, Los Tajos; M. E. Clinton, Sta. Teresa; W. Mansfield, Mina Grande.

Selling Mines in London.

EDITORS PRESS:—In a recent issue of your paper, I read with considerable interest an article from Major McLaughlin on the present state of the London market. It seems "capitalists" over there have been victimized so often through American mining ventures, they fight shy of properties of that class. This statement is in one respect misleading. The big people to whom mines are taken in London hardly ever put their own money into such enterprises. When they accept of a mine they put it on the market and endeavor to pay for it out of the sale of shares. If the public subscribe, well and good; the mine is sold; but surely money derived in this way from the masses cannot be said to come out of the pockets of "capitalists" properly so called.

Without splitting hairs, however, on definitions, we will admit the complaint urged is not without some foundation. The majority of mines from this and other countries, that have been floated in London, have not as a rule proven profitable. Are we to infer from this there is nothing in the business? As far as this coast is concerned, some of the largest fortunes in the world are here, and mining is the corner-stone of most of them.

All over the State are magnificent producing

properties whose names are household words. How is it, then, we manage to have such good mines at home and that we send such poor ones abroad? The reason, in my opinion, is that the methods pursued by London promoters absolutely exclude the possibility of their getting good mines. They will never pay anything down toward that object, and they are so frightfully slow and unsatisfactory in other respects, no one here, at least, will do it for them. It may be set down as a truism that no good mine can be procured for sale without money. Here is a large and valuable ledge, developments extensive, ore enough in sight for years; a mill even may be in operation and dividends in order. Does any one suppose the owner of such a property is going to give it up to irresponsible people to be hawked about London—to be hummed and hawed over for six months or longer—and finally returned to him perhaps unsold—all without a consideration? Rest assured he is not going to do anything of the sort. He is generally willing, on the basis of a certainty down, to give a bond to a responsible party. This latter, however, knowing how much red tape there is in London, how slow they are to enter on a negotiation, how long they are in making up their minds, etc., calculates the whole time of his bond will expire before the first steps toward a sale are taken. He knows he will then have to pay the owner another large sum down for an extension or forfeit what he put up in the first place, and, considering the management as being altogether too one-sided, he declines to entertain the matter at all, and so a really great mine is lost to English investors.

This, I think, is the key-note of the whole difficulty. If London operators want good mines to float, they will have to pay for the privilege of getting them, or at least be more ready to take some action when such are brought to their notice. If they will not adopt either course, they should not complain, but be satisfied with the thousand and one prospects and abortives which they are incessantly foisting on the public over there as valuable gold mines. VENDER.

The Lixiviation of Silver Ores With Hyposulphite Solutions.

This above is the title of a new work from the pen of Mr. C. A. Stetefeldt. Our readers are aware of the impetus which has been given to lixiviation by the discovery of the Russell process. Our columns have from time to time given an outline of the successive improvements which have been made in this process, and its literature has already become quite voluminous. Two papers have been previously published on this process by Mr. Stetefeldt and one by Mr. Daggett in the "Transactions of the American Institute of Mining Engineers." The facts already accumulated have been so many, and in some cases so unexpected, that there has been great need for some discriminating critic to work over the whole mass of results and to present to the profession a well digested hand book on lixiviation in the light of the new method.

This work has been admirably done by the experienced hand of Mr. Stetefeldt, and the result is a neat volume which is at once the most thorough, systematic and reliable treatise on the lixiviation of silver ores that has ever been published. Of course a great deal of space is given to the special methods of the Russell process, but the whole ground of the lixiviation of silver ores by hyposulphite solutions is gone over very carefully, and the practitioner will find an abundance of information on many obscure points that are seldom discussed in print.

The arrangement of Mr. Stetefeldt's work is such that references can readily be made at once to any desired point, and at the same time provision is made for additions of new subject-matter in subsequent editions without altering the old reference numbers. The ingenious system of paragraphing by which this is effected was, we believe, first suggested by Dr. R. W. Raymond.

Part I of Mr. Stetefeldt's book is devoted to the chemistry of the lixiviation process. The chemicals used are investigated, their cost, commercial rating, tests for purity and the relative economy of different grades carefully considered. Next the reactions of sodium hypsulphite solutions and the solubility of various metallic compounds in them are taken up. Then the reactions of the "extra solutions" are considered, and the decomposing effects of heat are studied. The chemistry of wash-water, a subject usually neglected, is carefully considered. The relative advantages of sodium and calcium sulphide as precipitating agents are thoroughly discussed, and it is clearly shown that in spite of greater cost, sodium sulphide is in general to be preferred. Finally the first part is concluded with a detailed account of the nature of the laboratory work.

This Part I contains a mine of valuable information on certain chemical relations of great importance which have hitherto been little understood, and from the lack of which many expensive failures have resulted in treating difficult ores. Much of this work is due to the indefatigable labors of Mr. Russell, whose voluminous researches have been condensed into their essential results by the author, but a great part of it is the work of Mr. Stetefeldt himself, who has gone over much of Mr. Russell's work where the results seemed doubtful; and he has added much new matter necessary

to a complete and logical presentation of the whole subject.

There is, however, one slight matter which seems open to criticism; that is, the manner in which Mr. Russell arranges his laboratory tests with extra solution. He has finally adopted eight separate methods for raw ores and eight for roasted ores. Mr. Stetefeldt has, after some investigation, reduced this number to five in each case, not feeling at liberty without further investigation to make a more radical reduction in their number. It is true, as he remarks, that this laboratory work looks more formidable than it is in reality, as in general it has only to be gone through with in any given case once, when the ore is first investigated. After that, only two or three of the methods are used to check the daily work. But the objection we make to Mr. Russell's laboratory tests is that they seem to us entirely empirical, and not as they ought to be selected to imitate as far as possible, on a small scale, the essential conditions which exist on the large scale. Of course it is not possible to imitate them all, nor would it be necessary. In proof of this we cite the fact mentioned by Mr. Stetefeldt (p. 96): "In addition to this, Mr. Russell found that in many cases identical methods applied in the laboratory and in the mill did not give equal results, but that there is, in every case, some one laboratory test, the results of which closely correspond to those of the most advantageous method used in the mill." This lack of correspondence between the laboratory and mill tests is easy to understand when we consider that there is often very little correspondence between the conditions maintained in the two cases, density of hypsulphite, for instance. It would evidently be of great convenience in determining the applicability of the Russell process to new ores if the method which gave the best result on the small scale had some definite relation to the results obtained on the larger scale. We hope that this matter may receive some further attention at the hands of Mr. Stetefeldt and Mr. Russell. But, after all, this is a small matter, and inevitable in opening up a new method where there are so many more important subjects to receive attention.

Part II takes up the lixiviation process in its practical application, and describes in detail the lixiviation plant. Many of these details are new, and others are the results of considerable experience; they are all well worked out. The solutions, the handling of the ores in the vats, of the wash-water, the lixiviation proper, the precipitation of the silver and of the base metals, as well as their subsequent treatment, all receive close and critical attention, and many original suggestions are made well worthy of a careful trial. Data for mill construction, estimates of cost of plant and of running expenses, are given as far as experience warrants, and make a good showing for the Russell process.

The work concludes with a comparison of the Russell process with ordinary lixiviation, and with amalgamation both of raw and roasted ores. These results are already in part familiar to the readers of the PRESS, though Mr. Stetefeldt presents some of the latest results from the experience at the Ontario mill, which are entirely new.

The reactions of cuprous hypsulphite, which play the most important part in the Russell process in effecting a high extraction of silver, recall the well-known part played by cuprous chloride in nearly all processes of raw amalgamation. When in addition to this we remember the remarkable solubility of silver salts in hypsulphite solutions we can readily understand how some of the remarkable results obtained with raw ores by the Russell process should have come about. The simple and inexpensive plant required for this process, the small amount of power and of manual labor required, render the lixiviation process in its improved form a very formidable rival to amalgamation. The good results which have sometimes been obtained with tailings from amalgamation suggest also many good openings for the process. The Comstock tailings, for instance, on which so many processes have been tried in vain, would make a good opportunity for the Russell process. We understand that experiments in this direction are already projected. Also that several new mills of large size for the Russell process are shortly to be finished, so that experience with the process is likely to accumulate.

There is one thing, however, about this method, in common with other lixiviation methods, which should be better understood. That is, while it requires but little skilled labor to carry on the operations, it does require a skilled metallurgist at the head of the work to give it his constant personal attention. The investigations of Mr. Stetefeldt show how delicate are many of the chemical and physical conditions on which the success of the process turns, and it is easy to see why so many lixiviation processes fail when they are put in the hands of what Mr. Stetefeldt delights to call "the insular amalgamator," the man whose muscular development exceeds his mental training and skill. Such a man has his place in reducing ore, but it is not at the head of a lixiviating-mill, least of all with a new method where there is still much to learn.

Mr. Stetefeldt's work will do much to convince those who study it thoroughly that it will pay corporations to put their milling-work in the hands of competent men whose theoretical training has been sufficiently thorough to make their practical experience of some use to them. When this is done, the "muscular amalgamator" will be assigned to his true place, where he will be of use at handwork in-

stead of headwork, and much money will be saved thereby.

In conclusion, to those who wish the latest information on the subject of the lixiviation of silver ore in a compact and well-digested shape, shorn of needless verbiage and obsolete and abandoned methods, we can recommend this work as the standard authority.

Electric and Cable Transmission of Power on the Comstock Lode.

The following interesting description of the cable system of transmission of power, now in use on the Comstock, as well as the electric system about being introduced, from the well-known Virginia City correspondent, Dan De Quille, will be read with much interest:

The Comstock mines are now in a very prosperous condition.

It is true that we have no such great and almost fabulously rich bonanzas as was that found in the California and Consolidated Virginia mines some years ago, but more different mines are now yielding paying ore than ever before at one time. Also, constantly, improvements in mining and milling machinery are being made. We can now profitably work ores that we could not touch a few years ago. Wood and mining timbers are cheaper now than ever before, and transportation by railroad to the mills on the Carson river has been lowered.

Also we have now laid from this city to the Sierra Nevada mountains no fewer than three lines of large iron water pipe. These pipe lines afford water for driving mills at the mine by water-power. The Sutro tunnel now affords us opportunity for this economical use of all the water that can be brought to this city. It gives us 1600 feet of fall everywhere in the city—yes, over 2000 feet of fall, as from the point here where the water is carried along the side of Mount Davidson down to the taps of the shafts of the leading mining companies there is from 500 to over 600 feet of fall. At every mining shaft in town we have at least 2000 feet of fall for water-power.

Cable Transmission.

The Pelton water wheel makes it possible for us to utilize every foot of this fall, and to use the same water over and over. The following examples will explain how this feat is accomplished: At the battery-mill of the Consolidated California and Virginia Mining Co. water is brought down off the side of Mount Davidson through a heavy iron pipe. It reaches the mill under a vertical pressure of 616 feet. The pipe carries 160 miners' inches of water, and this is turned upon a Pelton wheel 10 feet and 10 inches in diameter. This one small wheel drives 80 stamps and 12 pulp-grinding pans, running some 200-horse power. The pulp from the batteries is not amalgamated in this mill. It flows (from the grinding pans) through a four-inch iron pipe to the California amalgamating-mill 1500 feet further down the side of the mountain.

The California battery-mill stands about 100 feet below (saw of) the main shaft of the mine, known as the C. & C. shaft—California and Consolidated Virginia. After the water has exerted its force upon the surface wheel in the battery-mill it is caught up and carried through a short drift to the C. & C. shaft, which connects with the Sutro tunnel at a depth of a little over 1500 feet. The water is carried down the shaft in a large iron pipe. At a depth of 500 feet it is turned upon another Pelton wheel of the same size as that in the battery-mill. Having spent its force on this wheel, the water is caught up (it falls from the wheel dead and gentle) and turned upon a Pelton at the 1000-foot level and upon a third at the 1500-foot level. By means of steel wire cables the power developed by all these wheels down in the shaft is brought to the surface. At the surface the cables land the combined power of the three wheels on a huge horizontal steel shaft 150 feet long. At the farther end of this shaft (outside of the hoisting works) are large grooved pulleys, over which run round steel wire cables which transmit the whole power of the three subterranean Peltons to the big pan-mill, 1600 feet to the east down the side of the mountain. There are driven all the pans and settlers of the amalgamating-mill, five dynamos (which furnish electricity for use in amalgamating by the Rae process) and much other machinery, with still power to spare.

The cables, by means of which the power is transmitted, pass over supporting pulleys that are placed on the tops of five wooden towers. On one of these towers (called the Angel tower) the direction of the cables is changed from east to almost due north. In all, from the bottom of the shaft to the mill, the power is transmitted 3100 feet.

Electric Transmission.

This is an example of the transmission of the power of Pelton wheels by cable. At the new Nevada water-mill close below the main shaft of the Chollar mine, we are soon to see the power developed by Pelton wheels, transmitted by electricity to the surface and then a distance of about 100 yards to the mill named. This mill contains 60 stamps, with a full complement of pans, settlers and other apparatus. A Pelton wheel ten feet and ten inches in diameter drives 40 of the stamps, with their pane and settler, under pressure of a vertical column of water 460 feet in height—being the fall attained down the side of the mountain. Here, too, the water is caught up as it drops lifeless

AN American economist says that every \$5 of precious metals dug out of the earth since 1850 has cost \$6.

Something About Elevators.

NUMBER III.

Of course it is a question of public importance that the risk attaching to the various kinds of mechanical-lifting power should be reduced to a minimum.

Whether for freight or for passengers, that one should be adopted which is safest. Almost every month some new safety clutch is patented and placed on various wire-rope elevators to the assured safety of the passengers—assured, that is to say, until it is actually required, and then it is found from some cause or other (most pronounced when least convinced) that the safety clutch is an imposture, and no wonder. No apparatus can be relied upon to supply a sudden want unless it is constantly in use, and as these clutches are never tried from the time they are put in, it is a matter of course that when wanted in an emergency they are too stiff to work efficiently.

There is very little difference, after all, in the multiform wire-rope elevators, whatever the motive-power may be. There is always the question of gearing, and this being given, any force may be used to drive them. The steam engine is at all times a dangerous article for elevators, there are so many superadded risks in connection therewith. The engine itself is liable to give way, a cylinder cover may blow out, the piston rod may break at the crosshead, the gearing itself may give way, and there is also the fact that there is considerable danger of overwinding, while the expense of lowering is as great as that of raising.

The gas engine as a motive-power has all the risks of the steam engine and more besides; gearing being inevitable, owing to the peculiar intermittent nature of the engine, straps have to be used, and these are of all transmitters the most dangerous. Thus, in an elevator worked by a gas engine, in addition to the ordinary risks, there is the risk attending the use of driving straps and gearing in the working crab, and of brake gear, the possibility of overwinding and the extra strain on the whole mechanism due to the shock of the explosions. We naturally look to hydraulic-power for a solution to these difficulties, and it will be at once seen that one element of danger ceases, and that is, no brake-power is required, as the escape of water through the valves is regulated simply and easily to allow of the gradual descent of the elevator, and in addition to this the stuffing-box acts as an automatic brake by the friction caused by the passage of the ram. Then the perfection of control by a hydraulic ram is obtained, as one single valve suffices for all the motions required.

"Which force," asks Mr. Ellington, a London expert, "will give the greater efficiency—power acting by fluid pressure on a ram passing through a single stuffing-box or leather, or the same power acting through ordinary gearing and finally winding the lifting chain upon a drum? The loss of useful effect from the latter cause alone may equal that due to the friction of the ram. When the water pressure is available without pumping, the question of relative economy, as between hydraulic and ordinary gearing, does not require argument; that by hydraulic gear is the most economical is sufficiently obvious."

As regards efficiency, it is well known that a direct-acting ram of careful manufacture gives an efficiency of between 70 and 80 per cent. No geared elevating machinery driven direct by a steam engine gives anything approaching so high an efficiency as this, and even what efficiency it would give would be greatly reduced if the steam engine had to be kept constantly moving, which would be a greater loss than that arising from the invariability of hydraulic-power, while it may be remembered that though the power of hydraulic elevators is invariable, yet when lifting light loads there is a considerable gain in speed. "Until, therefore, it can be shown," says Mr. Ellington, "that the use of hydraulic pressure with a *direct-acting ram* entails more friction than a system of ordinary gearing to do the same work, hydraulic-power will remain the most economical as well as the safest agent for direct lifts." A cage raised and lowered on the top of a ram (the cylinder being sunk in the ground) is the simplest form of hoist. Provision in this case has only to be made for a varying weight due to the altered condition of the load. As the ram rises the head and pressure diminishes, while

the weight of the ram increases as it is less and less immersed in water. A counterbalancing weight is therefore required to lower the cage when empty and to adjust the varying weights of the chain as the cage rises and falls, and also to balance the weight of the ram. The counterweight is usually attached to the chains connected with the cage and passing over fixed pulleys, sometimes differently fixed to meet peculiar requirements; in some cases the rams are concealed from view by being inclosed in the main columns, and in other cases, when very heavy loads are expected to be used, auxiliary pistons are provided. It will thus be seen that these elevators can be readily modified to meet all possible requirements.

MILLIKEN'S IMPROVED DIRECT-ACTING HYDRAULIC RAM ELEVATOR.

abears at the top of the elevator frame. The amount of weight to be provided must be sufficient to balance the cage and the whole weight of the ram when at the top of the stroke, *minus* the weight of the chain, which then assists the counterweight. The accompanying sketch shows Milliken's Improved Direct Acting Hydraulic Ram Elevator, and indicates the method of construction and the manner in which they are usually arranged in buildings. They are,

The drawing is not made to scale, as it would then occupy too much space in our columns, but all the required parts are shown in vertical section. The main ram is a simple tube of wrought iron, which sustains the cage at the top and passes down into the well as the cage descends, the well guide-posts being made of either wood or iron, as required.

The simplicity of the machinery must commend itself to all engineers, the working parts

consisting only of a ram, the well tube and a pair of valves. There are no parts that will wear out, and with the exception of the packing gland or stuffing-box, which could be repacked by the boy who has charge of the elevator, if necessary, there is an entire absence of friction—at most, the friction might be put down at say a fifth, while the guaranteed efficiency of a direct ram, if properly erected, should be eight-tenths.

Water enters the cylinder and is discharged through the two vertical pipes shown in the lower story in our engraving, and the motion is controlled by a simple and ingenious valve arrangement. These valves, we understand, required formerly an elaborate kind of gearing which is now replaced by three *simple* levers operated by the rope as shown. This rope passes through the cage, over the pulleys at the top and returns at the side of the well. The cage is balanced by counterweights sliding within the main guide-post or in separate ways for the purpose.

These weights are suspended on chains passing over the large pulleys at the top, but are not attached to the cage in the usual manner, for they are connected to wire ropes passing round the cage into the main ram and from there to the bottom, where they are attached to the bottom cap as shown in our illustration.

This cap is made large enough to come into contact with the packing-box at the top of the cylinder, so that the cage can never overrun to the top as some elevators have done.

It is claimed by the agents here, Messrs. W. T. Garratt & Co., that Milliken's Ram Elevator is the safest, most economical and most efficient in the universe, and after a careful study of the machinery, and seeing the working parts doing their duty at the various large stores and buildings in San Francisco, we are not prepared to dispute the fact. On the score of safety it will be readily seen that the direct-ram system absolutely precludes the possibility of falling. No catch or safety-springs are required when the piston rod or ram acts as a prop underneath the cage. Even supposing the cage could fall, it would descend only as quickly as the ram could displace the water below, which might be compared to a door being closed by a patent "Norton" door check. The door simply *cannot* bang to, and in the same way and practically for the same reason, the ram cannot bang back to its place; it *must* descend gradually.

As regards economy, the quantity of water required to raise a certain load is always the same; to this must be added friction of working parts and resistance of gearing, etc. Now the economy of this ram elevator consists in the fact that friction is reduced to an absolute minimum, there being only one packing-box, and resistance of gearing is nil, because no gearing is used.

To test the real efficiency of an elevator, the pressure, volume and load must be *measured*. Opinions and assertions respecting consumption of water are of no value. The amount of work done by an elevator in comparison to the power used varies as much as 35 and even 40 per cent; that is to say, 100 pounds of water pressure will raise from 50 to 85 pounds of load, according to the perfection of machinery.

An easy rule for ascertaining the quantity of water used is, multiply the area of the ram by the stroke, both in inches, and divide by 231. Roughly speaking, a six-inch ram equals $1\frac{1}{2}$ gallons per foot, and a seven-inch ram equals two gallons per foot.

These elevators have been erected in San Francisco up to 83 feet in height and from 1 to 60 tons in capacity.

The sole agents and manufacturers for this coast are Messrs. W. T. Garratt & Co., Fremont and Natoma streets, San Francisco, who have acquired all rights, title and interest in the patents.

THE fire at the Smithfield mine, Nanaimo, is still burning, but is gradually being subdued. The fire engines are pouring water down the slope and playing on the fire. The mine will probably be closed for several weeks and between 200 and 300 men are out of work. If the fire is not soon put out it is thought that the mine will have to be flooded, which would cause a much greater delay.

THE Montana Mining Co. has paid so far in dividends \$2,149,000, of which \$534,600 has been disbursed this year.

MECHANICAL PROGRESS.

A Steam Boiler That Cannot Explode.

M. Serpollet of the French Society of Civil Engineers has invented a steam boiler which, he claims, cannot explode. A boiler of this construction was recently submitted to an examination by the Society of French Engineers, who report that they found the piston, pump, cylinder, valves, etc., in perfect shape and good condition after several months' constant use. The boiler consists simply of a solid drawn steel tube which has, with the exception of its two ends, been rolled out flat, so as to leave in it a channel only 0.1 to 0.3 millimeters wide. The tube is then coiled spirally, and its inner end is bent up vertically to receive the steam pipe, while the feed pipe is screwed into the outer end of the spiral. This spiral-tube boiler is placed into a furnace which may be of the slow combustion type, and there is no need for either stop-valve, blow-off cocks, gauge-glass, or safety-valve. The feed-water, upon entering the narrow channel within the tube, is instantly converted into steam, and issues perfectly dry. The inventor claims that, owing to the great velocity with which water and steam must pass through this novel boiler, there is no possibility of scale accumulating. The calcareous salts held in solution in the water, which at first sight would appear to be highly detrimental to the proper working of the boiler, are, however, reduced to an impalpable powder and really act as a lubricant.

Suppose that a boiler of one-horse power is made of a tube 6 ft. 6 in. long, $4\frac{1}{2}$ in. high, and seven-eighths of an inch thick, having a total weight of 70 pounds, and giving a heating surface of say $5\frac{1}{2}$ square feet. As to capacity of tube it may be estimated to be equal to anywhere in the region of a cubic inch, and it will evaporate 45 pounds of water per hour, with a consumption of nine pounds of coal. The supply of steam to the engine is regulated by regulating the amount of feed-water sent into the boiler, and for this purpose the inventor arranges the regulator of the engine either to act upon the waste-cock of the feed-pump, or upon a sliding block, by which the stroke of the feed-pump is altered. There being practically no water in this boiler, the regulation is said to be as precise and quick as with the usual types of engines. To stop the engine it is only necessary to close the cock on the suction pipe of the pump, or open the waste cock fully. A few days after M. Serpollet had brought this boiler before the Société des Ingénieurs Civils, he showed the application of it to a steam-driven tricycle in the streets of Paris. The boiler was carried behind the axle of the main driving-wheels, and the engine was fixed under the rider's seat, which also contains a supply of water and fuel. A speed of $6\frac{1}{2}$ miles an hour was attained over roads having 1.5 per cent grades. The weight of the tricycle in service, but without the rider, is $3\frac{1}{2}$ cwt.

RELATIVE ADVANTAGE OF CAST AND WROUGHT IRON RADIATORS.—Tests have been made by Mr. Wm. Anderson, M. Inst. C. E., England, with cast and wrought iron surfaces in pipes of different diameters and different thicknesses apparently, as the pipes were ordinary four-inch cast iron and two-inch wrought iron pipes. Thus, temperature in pipes, 190°, in room, 60°; difference, 130° F.; results, 232.7 units of heat per square foot per hour for cast-iron pipe and 356 units per square foot per hour for wrought-iron pipe. Another: temperature in pipes, 160°; in room, 60°; difference, 100° F., 147.1 units per square foot per hour for cast-iron pipes and 225.2 units per square foot per hour for wrought-iron pipe. The cast-iron pipe, of probably twice the thickness, gave out 53 per cent less units of heat, from which it can be seen that the thickness of the metal in radiators is of great importance, and that if the cast-iron pipe had been the same as the wrought iron, which thickness is attained in numerous cast-iron radiators, a much different result might have been the consequence. These figures also show that the emissive powers of surfaces do not increase in the same proportion directly as the difference of temperature, as it may be observed that the power of emission varies from 9 to 10 per cent at the given temperatures. Mr. Anderson states, "the rate of emission for differences of temperature of 200° and 100° differed by as much as 22 per cent. At 200° there was 22 per cent more heat given out per square foot per difference of degrees per hour than at 100°." Practically, the difference between wrought and cast iron of the same thickness is not of much importance.

AN ANTI-FRICTION JOURNAL.—There was recently a very interesting exhibition made in Boston of the results of the long running of one of Tripp's anti-friction journal roller bearings. One year ago, according to the *Commercial Bulletin*, a car of the Consolidated road was equipped with this bearing, and has been in constant use ever since, covering about 100 miles a day. During this time the bearings have not been touched or oiled, and there was consequently great curiosity among those interested in the journal, and the railway people, in the taking of one of the bearings from under the car. It was found in perfect condition, and showed but the slightest possible wear in a few parts and none at all in most. The Tripp Company had warranted the bearing for a year, but

it was evident that it would have run much longer than that without attention, and that its life without oiling would be practically the same as the life of the wheel, or from two to three years. The bearing is constructed on an entirely new principle, by which the axis of the rolls are always kept in line with the axes of the shaft. The company claim that recent tests demonstrate a saving of from 30 to 70 per cent over ordinary journals. The journal-boxes are dust proof, and one lubrication answers for a year's service.

SWORD-BLADES ARE MADE AND TEMPERED so that they will chip a piece out of a stone without showing a nick upon their edge. This information is given by a correspondent who has been through the great sword manufactory at Solingen, Germany. He writes to a Pittsburgh paper a long description of the methods used there. The steel, he says, is cut from bars into strips about $2\frac{1}{2}$ inches wide, and of the required length, by a heavy cutting machine. These are carried into the adjoining forgeroom, where each piece is heated white, hammered by steam so that about 20 blows fall upon every part of its surface, and then thrown into a harrel of water. Afterward these pieces are again heated in a great coke fire, and each goes through a set of rolls, which reduce it to something like the desired shape of the weapon. The rough margins are trimmed off the piece of steel in another machine, and there is left a piece of dirty, dark-blue metal shaped like a sword, and ready for grinding. This is done on great stones, revolved and watered by machinery, the workmen having to be the most expert that can be obtained, as the whole fate of the sword is in their hands. It is afterward furnished on small wheels managed by boys from 12 to 16 years old, and when it has been prepared to receive the fittings of the handle is ready for the testing, which has to be done with great care. Any fault in the work is charged to the workman responsible for it, and he has to make it good. It is said that any blade which will not chip a piece out of a stone without showing a nick on itself is rejected.

ENGLISH AND AMERICAN MACHINE TOOLS.—An American machine tool manufacturer has just returned from a trip to Europe, where he says he did a great deal of pure loafing, but not apparently without an eye to business. He finds a great difference in machine tool processes in England, as compared with this country. He looked through a number of establishments, and nowhere saw a quick-return arrangement on any planer or slotter, and hardly anywhere did he observe cut gears in use on machine tools. Other differences were noticeable, proving to his mind that an equal number of workmen operating American-made tools logically ought to do more work in a day than the same number of men operating English-made tools. He says an English concern had just got in about \$10,000 worth of machine tools, built by an American manufacturer, and took considerable pleasure in showing them off to a prominent English builder, with the pleasant suggestion that there were some tools worth copying! Modesty forbids his mentioning the name of the American builders. —*Am. Machinist.*

NEW APPARATUS FOR TRANSMITTING FORCE.—A French engineering professor, M. Raymond Sayers of the Louvain University, has invented an apparatus for transmitting force between bodies moving at greatly varying velocities without accompanying disadvantage of a violent collision. The method consists in furnishing the contact surface with steel bristles, which, by the entanglement of their "bristles," are enabled to grip one another. In this way the swiftest motion may be imparted gradually to a perfectly stationary body and a maximum of shock can be arranged for, which can never be exceeded, be the impelling force and velocity what they may. The inventor has in view chiefly the requirements of quickly moving lifts, railway trains and other bodies moving at high speed and with great momentum; and if it be possible to produce in this way an effective brake, or to obtain an automatic working of railway signals, much will be done to minimize some of the most serious perils which at present threaten life and limb to industrial occupations.

MORE ABOUT COMPRESSED PAPER FOR AXLE BEARINGS.—Further experiments have been made in the use of compressed paper for bearing in place of brass, etc. The parchment is strongly compressed before being used, and it is dried to prevent subsequent shrinkage. Wooden rings are placed on the outside of the bearings, fitting the collar of the journal. An emulsion of water and oil and all the mineral oils are used as lubricants. The parchment soon becomes impregnated with oil, and is able to go a long time without a renewal of lubrication. It is between the body of the journal and the thin edge of the parchment segments that friction takes place. The claim is made that the compressed paper bearings make a tough material that is superior to metal. Such bearings are also in use in a German sawmill, with satisfactory operation.

THE NEW SIX-INCH GUN, throwing a 100-pound projectile and penetrating 13 inches of plating at 1000 yards, is a gun of efficient power to deal with almost anything built or huddled. It may fail to penetrate the strong patch, but it will knock any other part of the ship, and most of the men, to pieces.

SCIENTIFIC PROGRESS.

How Hot Waves are Formed.

The present heated spell has drawn attention to the periodical fluctuations of heat energy, which produce what is called "hot waves." These waves have sometimes been assigned to some occult influence of the moon, but a careful and rigid examination of that theory by meteorologists has resulted in proving it fallacious.

Other causes for hot spells, therefore, must be investigated. Of these, the influence of prevailing winds for any region in summer is the most important. A glance at the map, showing the physical conformation of the United States, will exhibit the long valley of the Mississippi river extending from the Gulf of Mexico to the Great Lakes.

In the Gulf, under the fierce rays of radiant energy from the sun, the evaporation is, comparatively speaking, enormous. The hot winds from the South bring northward immense quantities of aqueous vapor, held in solution, so to speak, by the atmosphere. On the other hand, the winds from an area of high pressure, which generally move southward, are cold and dry. The high areas are developed in the British Possessions, and invariably move into the United States from Manitoba and that section contiguous to it.

Owing to causes easily ascertained as astronomical principles, the great southerly drift from the Gulf prevails in the central portion of the United States in summer.

If any observer notes the wind direction and the humidity of the air for a few days in July and August, and finds a steady current from the South, with slowly increasing humidity, he can easily predict "a hot spell" as rapidly approaching. To the ordinary observer, it is marvelous that such oscillations occur while the sources of all heat appear to remain uniform.

The sun, the source of heat, does not blow hot and cold. It remains above the horizon, radiating its energy outward to all space for nearly the same time each day, yet one day is cool at a temperature of 74°, and in a day or two more we are sweltering in the torrid-zone temperature of 100°.

One of the greatest factors in producing this wide diversity in temperature is the relative humidity or absolute amount of moisture in the air. This vapor is a gas and invisible until condensed into clouds, rain, etc.

The heat received from the sun suffers absorption in its passage through a moist atmosphere, and of that portion of it which comes to the earth some is radiated back by the earth to the sky. This is stopped and absorbed by the aqueous vapor, and very soon the air is superheated. Thus the temperature of the air is raised excessively by the presence of the invisible vapor, and these conditions produce what are denominated, very incorrectly, as hot waves.

The conditions for the continuance of the heated trend depend on the southerly winds—vapor-laden and themselves hot—and also the absence of the cooling influence of the great northerly drift from Manitoba.

When the daily weather reports show an area of high barometric pressure, advancing southward toward the Great Lakes, the influence of the cold, dry winds, which accompany its progress, change all this and make a "cool wave."

The agricultural section of the community should notice when the peculiar sensation of sultriness and oppression becomes felt, and the air is superheated as well as saturated. This is the time of danger, as the atmosphere is liable to assume what is called "an unstable equilibrium," and destructive storms ensue owing to the abnormal state of the air. —*Cincinnati Enquirer.*

The Huge Electro Magnet.

This huge electro magnet which we have already noticed as having been formed by winding two cannon placed side by side at the U. S. Naval Station at Willet's Point, is still a thing which attracts much scientific interest. This magnet has been formed by connecting two 15-inch Rodman guns at the trunnions and winding them with about four miles of old insulated torpedo cable. With this apparatus and the use of a 30-horse power dynamo, an electro magnet of enormous power will be obtained. The wire with which it is wound will soon be increased from four to six miles in length. This apparatus furnishes cheap and ready means for making many really valuable and interesting experiments.

The tests have not yet gone so far as to give quantitative results. In fact, only a preliminary trial of the magnet (not yet fully wound) has been made, and its whole strength cannot be measured until it has been more firmly anchored. But it shows a tremendous attraction for all things ferruginous.

One of the peculiar phenomena observed is, that a 15-inch shell, weighing 320 pounds, placed in the muzzle of one of the guns is violently forced out when the current passes through the wire, yet it does not leave the gun, but swings around to the lower side of the muzzle, where it remains hanging, like a carpet-tack on an ordinary magnet, even with a second shell of equal weight depending from it. Twenty men cannot pull an iron rail from the muzzle of the gun while the current is passing.

Major King has had an armature made of 11-inch plates, built up to a thickness of five or six inches, so as to get a more suitable mass for the giant to work on, and a five-ton Duckham dynamometer fails to register a force sufficient to remove it.

Seemingly impossible experiments have been made with it. A handful of small nails thrown with force away from the magnet fly back and attach themselves to it. Another experiment was made with cannon-bells.

The most amusing experiment was made with a sledge-hammer. When one tried to wield it in a direction opposite to the magnet, he felt as though he were trying to hit a blow with a long feather in a gale of wind. There is nothing in the world that could take the conceit out of a strong man so much as this simple experiment. Another amazing test was made with a number of carpenter's spikes. A spike was put lengthwise on the end of the magnet, then another spike was attached to the first, and so on until a line of them stood straight out from the magnet at least four feet in length. Aside from their interest to science, the experiments were so novel and startling that they were entertaining even to those who were not interested in the wonderful developments of electricity.

An interesting and most satisfactory experiment was made with an American non-magnetic watch. While an ordinary watch was instantly stopped when brought near it, the non-magnetic watch was not affected when placed within the magnetic field. This test was a very satisfactory one, considering the importance that railroad employes should be provided with watches that cannot be influenced by the magnetism which is always largely generated by the masses of iron about the train and the friction of car-trucks, wheels, etc. The watch was held by its chain for ten minutes within the most intense portion of the magnetic field, yet it did not vary the hundredth part of a second. The men who held it said that he himself was conscious of the influence of the magnet. He could feel as he held the watch by the chain that some other power than his was keeping it suspended.

We shall await with much interest further results from this monster magnet, by far the heaviest and strongest ever constructed.

THE NEW FRENCH ARMY RIFLES.—The absolute mean deviation of the new magazine rifle for the French army is only a little over a foot at 1000 yards. Using a fixed sight, a man can hit struck up to 470 yards, as the trajectory is remarkably flat. The authorities do not at present propose to make use of a smokeless powder, as the keeping properties of these compounds in warm and damp climates have not as yet been tested. Lobel rifles are being manufactured for the French army at the rate of 1600 a day. The new powder, which it is proposed to use in future conflicts, is not only smokeless, but almost noiseless. The reports produce no noisy confusion in the ranks and the powder is far more effective than anything heretofore used in small arms of any kind.

A NEW MAGNESIUM LIGHT.—At a recent meeting of the Photographic Section of the American Institute there was shown a new magnesium light, which employed powdered magnesium instead of wire, and burned it in a strong alcohol flame instead of upon "flash cotton," as is now used. The advantages are that there is only about one-sixth as much of the metal needed; that there is proportionately less smoke made to annoy those who are present, and that the duration of the flame may be controlled at will, or it may be repeated as desired. The safety is undoubted and the convenience very great.

THE ELECTRIC LIGHT IN FISHING.—The electric light is now being used in fishing to attract the fish to a particular place to facilitate their capture. The principal trouble has been that the wires leading to the submerged incandescent light are apt to become fouled with the fishing appliances or with the cable of the vessel. To prevent this, Regnaud has out a primary battery which can be tossed overboard and regained when desired, the lead being upward from this battery to the lamp.

ELECTRICAL RESISTANCE ALLOY.—An alloy, the electrical resistance of which diminishes with increase of temperature, has recently been discovered by Mr. Edward Weston. It is composed of copper, manganese and nickel. Another alloy due to the same investigator, the resistance of which is practically independent of the temperature, consists of 70 parts of copper combined with 30 of ferro-manganese.

DEVIATION OF RANGE.—The deviation of range in guns when fired either north or south in the direction of the meridian has now become important in long-range guns. When a gun is fired due north or south which has a range of 11 miles, a lateral deviation of 200 feet must be taken into account for the difference in rotating speed between the spot where it is fired and the spot where the missile will strike.

A SHIP'S POSITION-FINDER.—The Watkins position-finder, for which the British Government paid \$225,000, has been proved to be very efficacious in finding vessels and like objects that could not be seen from the battery which was aimed at them, and such objects were struck very frequently by the guns from each battery, although invisible therefrom.

USEFUL INFORMATION.

The Old-Clothes Man.

There is a possibility that a man may wear out a suit of clothes several times. As soon as the wool is shorn from the sheep's back it is packed in bags and shipped to wool-brokers, where it is sold to the mills and manufactured into cloth, after being carefully graded and scoured. The product of the mill is sent to the commission-houses, where it is sold to the clothing manufacturers by the piece. If the cloth is of cheap quality, it is cut with a knife, only first-class cloth being honored by the shears, and is then sent to the small manufacturers and tailors to be turned into clothing.

When the work is finished it is examined by a board of examiners hired by the wholesale houses for this purpose, and, if passed by them, is placed in stock ready for sale and shipment.

The retail trade passes the garment into the hands of the consumer, who wears it out and then gives it away to some poor man or sells it to the second-hand dealer. The second-hand man cleans and repairs his purchase and sells it again for about one-third of the original cost. After being worn completely threadbare, it becomes the property of the tramp or does property for a scarecrow. When finally reduced to rags, it falls a prey to the rag-picker, who realizes on a small margin from the rag-dealer. As soon as a sufficient quantity of rags have been collected, they are shipped to some one of the many shoddy-mills in the country. There the rags are assorted and cleaned, and then ground into a pulp, which is afterward carded and spun into a filling commonly used for inferior cloth.

It finally reappears in the hands of the commission merchant as a poor grade of woolen goods, is again sold to the clothier and goes through the same operation as before. So in all probability, young man, you are walking about the streets chasing a fleeting item in a brand-new suit of clothes, the best part of which is an old overcoat or hat discarded by yourself two or three years ago.

HOW THE WORLD IS FED.—About half the inhabitants of the world work to supply the other half with food. "Even the oldest and best-informed man the trade," said an experienced salesman in the grocery business, "cannot begin to tell you anything about the wonderful extent of the traffic in food. Figures don't seem to express the thing so that anybody can realize how enormous the business is. Now everybody knows that corn makes only a small part of what anybody eats. By that it is meant that nobody eats corn enough to make it a principal article of diet. Yet there is one establishment in Maryland—a corn factory they call it—where there are 100,400 cans of corn a week put up and sold. Now consider that this is only one establishment out of hundreds in this country, and thousands in the world, where food is put up in cans. Then think that corn is only one small item of food, even among the canned goods. And then remember that canned goods are merely a fraction of the food supply, and you will be ready to acknowledge that the food industries of the country are too great to be readily grasped by the imagination. More than three-fifths of all the workers of the world are engaged wholly in raising or handling food."

A REVOLUTION IN GAS BURNING, says the New York Tribune, is proposed by Charles S. Upton, manager of the Rochester Lamp Company, New York City, who has patented, at a cost of \$50,000, in all countries in the world, a new gas-burner. The "Niagara" burner, as it is termed, sheds a soft lamp light of 100-candle power, consumes six feet of gas an hour, is simple in construction, and will be made to fit any gas fixture. The secret of the patent is in admitting the flame to a process of combustion through perforated brass fittings after it leaves the jet. One hundred men are at present employed making a stock of the new burners, which will be on sale soon at the price of \$1.50 each.

EXPLOSIVES IN MINES TO BE DONE AWAY WITH.—It has been proposed to do away with the use of explosives in mines where their use is attended with danger, and substitute the lately invented cartridge, one portion of which is filled with a mixture of finely divided zinc and zinc oxide, which collects in the condenser of the zinc retort, while the other part is filled with diluted sulphuric acid. According to the requirements in this case, the cartridge is put in its intended place, and then, by suitable mechanism, the acid is allowed to flow into the zinc. Hydrogen is then evolved, and by its expansive force the rock is broken down without combustion or violent explosion.

A MIXTURE of 10 parts of tin putty, 8 of prepared huckhorn, and 25 of spirits of wine, makes a good compound for taking the rust off drawing instruments, and will not injure them. They should be rubbed with soft blotting-paper after this compound is applied.

TO KEEP A STEEL PEN IN ORDER.—Steel pens will rust, no matter how carefully they are cared for, and they will not write well until the rust is removed from the point. This may be done by simply using a round slate pencil to

scour the rust from the inside, while the same instrument may be used to cleanse the outside of the pen. A very small quantity of rust will prevent the free flow of the ink. New pens, before using, may often be improved in the same way.

THE INVENTOR of the Volapuk language, Johann Martin Schleyer, Father Schleyer as he was called, died in Paris on the 9th inst. He was born at Oberlanda, Baden, in 1831, and educated for the Catholic priesthood, which he entered in 1856. He had a passion for studying languages, and acquired a knowledge of about 50 languages and dialects. In 1859 the idea of a universal, or rather a neutral, language possessed his mind, and during March of that year he constructed its entire grammar. He devoted his entire attention to the propagation of the Volapuk idea, and was the author of numerous writings on the subject.

ESTIMATING THE NUMBERS IN A CROWD.—It is curious to note the differing estimates put upon the size of meetings by the reporters of newspapers. If a man read only one paper he might be contented and believe that he had obtained the exact facts. The moment he looked at another he is forced to revise his judgment and strike an average between them. The attendance at a recent meeting in New York was variously estimated by the different journals of that city at from four to fourteen thousand. The average of 13 estimates was 6055, which careful judges have pronounced as a very close approximation to the actual attendance.

EATING HORSE MEAT.—Pandora, the famous stepple-chaser, was shot a few days ago on account of incurable lameness, and some of the choicest steaks cut from the carcass were served up at the Philadelphia Club as "filet a la Pandora" to several guests, Dr. Rush S. Huidekoper, her owner, and the cooks being sworn to secrecy. The guests pronounced the meat very toothsome, but were much surprised on learning that they had been eating horse meat. The joke, however, was enjoyed.

GOOD HEALTH.

Male Versus Female Brains.

Leaving the physical side, let us now compare the mental caliber of the two sexes. The first argument always brought out by the medical profession is the *a priori* one derived from brain weight. A woman's brain weighs less than a man's brain; therefore, it is argued, she must be inferior to him in mental power. In the first place, however, it is yet by no means certain that a large brain is superior to all smaller brains. Brain power depends, authorities tell us, first, upon quality; secondly, upon activity; thirdly, upon size.

The man who possessed the heaviest brain yet weighed was an American blacksmith, who does not seem to have been otherwise remarkable, even for the excellence of his iron work. However, admitting that if the quality and activity be equal, a large brain is superior to a small one, it is still uncertain whether or not women possess smaller brains than men in proportion to their size. When we consider how much of the brain is occupied in controlling muscular movements, it is obvious that the larger animal needs a larger brain to exert the same mental power than the smaller animal.

How much less, if any, the female brain weighs in proportion to size, has never yet been calculated. Even the average weight of the female brain itself is not exactly known, as every experimenter gives a different result. Parchappe estimates that the proportion of the female to the male brain is 999 to 1000. Surely the difference of stature would allow a difference of weight greater than this? Other inquirers give different figures. One of the best-known tables is quoted by Prof. Huxley in his "Man's Place in Nature," where the result seems adverse to feminine pretensions. Allowance must, however, be made for the following considerations: In the case of men, a larger number of brains were weighed, among which were included the brains of many celebrated men, especially collected for this object. The women's brains were much fewer in number, taken from the lowest source, and did not include the brain of one woman of distinction. A comparison of such material is obviously unfair. Yet among the female brains, the heaviest brain known to science up to that time was discovered. It weighed several grammes more than the brain of Olivier. Since that time, however, though great pains have been taken to ascertain the brain weight of celebrated men, not one record exists of the brain weight of famous women. The brain of George Eliot was especially remarkable. The following passage occurs in her life: "Mr. Bray, the enthusiastic believer in phrenology, was so much struck with the grand proportions of her head that he took Marian Evans up to London to have a cast taken. He thinks that after that of Napoleon her head showed the largest development from brow to ear of any person on record."—*Woman's World*.

CURING WHOOPING COUGH.—Babies are cured of whooping cough and typhus fever by the eucres at the gas-purifying establishment at the eastern end of Chestnut-street bridge. The cure is free and does not cost the city anything. The babies are brought there by their friends

and their mothers, and are placed over the purifying-pan, from which there is a constant escape of ammonia. The vapors make the youngsters cough until their little heads threaten to drop off and the big tears gather in their eyes. The more they cough, however, the better, because they are coughing the disease away. Frequently there are dozens of babies and young children around the pans, all coughing and making a great bluster and splutter. James Gilmore, one of the attendants at the pans, has been at the purifying-house 53 years, and he is a great friend of the sick babies and their mothers. He says that the whooping cough appears to be very bad about the city now, judging from the number of his young visitors. The ammonia treatment for this disease is generally recommended by Philadelphia physicians, and is very successful.—*Philadelphia Record*.

What to Eat.

The following table, compiled by Prof. G. W. Conklin, is eminently and practically useful, presenting as it does at a glance the available percentage of nutritive elements contained in the leading staples used as human food:

Milk	7	Boiled Mutton	30
Cabbage	7	Oatmeal Porridge	75
Eggs	13	Rye Bread	79
Apples	10	Boiled Beans	87
Peaches	20	Boiled Rice	88
Codfish	21	Barley Bread	88
Potatoes	22	Wheat Bread	90
Fried Veal	24	Corn Bread	91
Roast Pork	24	Boiled Barley	92
Roast Fowl	26	Butter	92
Roast Beef	26	Boiled Peas	93
Grapes	27	Olive Oil	95

It will be seen that the most wholesome and nutritious articles, as oatmeal, flour, peas, beans, rice, crushed wheat, corn, bread, etc., are vastly superior to beef in supplying effective ability to labor, besides being obtainable at about one-third the price of the latter. After all that can be said, pro and con, touching a vegetable diet, certain we are that the average man who limits himself to a well-selected regimen of vegetable food will, accidents aside, go through life with a clear mind in a healthy body, will sleep sounder and come nearer the allotted age of threescore and ten, having a better digestion and fewer headaches than any man who indulges in roast beef with the usual variations.

THE TOMATO IN BRIGHT'S DISEASE.—When Thomas Jefferson brought the tomato from France to America, thinking that if it could be induced to grow hountfully it might make good food for hogs, he little dreamed of the benefit he was conferring upon posterity. A constant diet of raw tomatoes and skim-milk is said to be a certain cure for Bright's disease. General Schenck, who, when Minister to England, became a victim to that complaint, was restored to health by two years of this regimen. With many persons the tomato has much the same effect upon the liver as a small blue-pill, and whether it is that as a people we are less bilious than in former years, or that the doctors of the new school practice less severe remedies than did those of the past, it is certain that mercury is prescribed with less frequency than of old.

DANGER IN TURNING BOOK LEAVES.—People who indulge in the elegant habit of wetting the forefinger before turning the leaf of a book will do well to note the report of the authorities of Dresden, who have been investigating the question whether circulating libraries are a medium for the spread of infectious diseases. They rubbed the dirtiest leaves of the books, first with a dry finger end then with a wet, microscopically examining the product in each case. In the first case scarcely any microbes were found on the finger; in the second case, plenty. Though all these appeared to be of a non-infectious character, the committee winds up with a recommendation to readers not to wet the finger in the month for the purpose of turning over the leaves.

HOW SCARLET FEVER MAY BE DISTRIBUTED.—The following case shows how scarlet-fever poison is distributed. A little girl, eight years old, living at Fortesse Monroe, was attacked with scarlet fever. For a long time no possible source of contagion could be discovered, but at last the attending physician learned that one of the house servants had nursed a case of scarlet fever in a distant city just about a year before. After the case terminated she packed some of her things, including some clothing then worn, in a trunk, and left the place. A year later she had the trunk sent to her, opened it and took out the contents, the little girl being present and handling the things. Very soon after the latter was attacked.

EFFECT OF EXCITEMENT ON LONGEVITY.—The question as to whether or not excitement shortens life is being agitated, and it is held that anything which quickens the action of the heart, any kind of excitement, taxes and reduces the storage of life. Almost every one knew this long ago, and it is only recently that the matter has been considered in the light of percentage.

CANNED GOODS RENDERED DANGEROUS BY FIRE.—Three families have been poisoned in San Diego through the eating of canned goods saved from a recent fire. They had eaten of canned salmon and oysters which had become impregnated with oxide of tin and lead by the action of the fire.

More Coal in Oregon.

Coal mines throughout the Northwest are attracting much attention of late, and many discoveries and developments are being made, and the quality of different veins of coal is being tested. A test of the coal from the Turtle River mine was made on the Portland & Willamette Valley railway. This mine is situated on Turtle river, Washington Territory, which runs into the Cowlitz about 20 miles from its mouth. It is one and a half miles from the Northern Pacific railroad and two miles from the Cowlitz, at a point to which it is navigable ten months in the year, and with slight expenditure the river could be made navigable during the entire year to a point opposite the mine. The company has been working on the mine for some time, and has run in two tunnels, one 75 feet long and the other 200 feet long, both striking the veins of coal. Mr. James Williams, an expert who examined the mine, reported that there were two veins of Cannel coal underlying the whole property. The upper vein is three feet two inches thick. It is clean and hard and has good rock for roof and floor. The second vein is as good in quality as the first. The veins will each produce about 3500 tons of coal to the acre, which he estimated could be loaded on the cars for 75 cents a ton.

An analysis of the coal was made by W. G. Jenne, who found it to contain: Fixed carbon, 82.25; combustible gases, 52.21; ash, 7.54; moisture, 8.

The test was made under the supervision of Superintendent John McGuire. In answer to questions of a reporter, he said: "The coal is far ahead of any produced here which I have tried. It compares favorably with the famous Kenewee coal of Illinois. It is clean to handle, makes little or no smoke, burns clean, with but little ash or clinkers. I handled the throttle for 15 years in a coal country, and know what coal is, and can say that this is the best locomotive coal mined in the Northwest which has come under my notice."—*Portland Oregonian*.

The Strength of Ropes.

The quality of workmanship, strength, extensibility and elasticity of round and flat ropes of hemp and aloes, and of iron and steel wire, have been experimentally investigated by M. A. Duhoul, and the results of his experiments published in the *Bulletin de la Société d'Encouragement des Arts*, Paris. In his experiments M. Duhoul used a horizontal hydraulic press and a weighing apparatus consisting of a steel yard and sliding-weight, by which tensions of from 1 to 130,000 pounds could be recorded. For higher pressures a gage on the body of the press was used. Specimens were fastened by winding each end on a grooved pulley of special construction. The usual length of specimens for testing was 13 feet.

The results of all the tests gave for the average tensile strengths of ropes the following:

	Lbs. per sq. inch
White hemp	10,500 to 11,200
Tarred hemp	7,700 to 8,400
White manila	9,800 to 10,600
White aloes	5,600 to 7,000
Flat, tarred hemp or manila	7,900 to 8,400

A factor of safety of four or even three, in some cases, is considered safe for ropes.

A rope of unannealed wire has an ultimate tensile strength of about 55,000 pounds per square inch of section of metal; when annealed the ultimate strength is reduced to about 45,000 pounds, but the elongation is nearly doubled, being 12 to 15 per cent in annealed wire. The heat wire ropes for mining purposes have a much higher tensile strength. Another writer on the same subject says that the tensile strength of a wet rope is only one-third that of the same rope when dry, and that a rope saturated with soap or grease is still weaker.—*Chicago Journal of Commerce*.

ROMITE VS. DYNAMITE.—Some comparative experiments have recently been made in Sweden with dynamite and romite, the new explosive invented by Herr S. Joherg, a Swedish engineer. The romite used was of the ordinary kind manufactured in Sweden, and the dynamite was of M. Nobel's usual make. For the experiments lead cylinders three inches in diameter and eight inches in length, with a cavity in the center one inch in diameter and 4 1/2 inches in depth, were used. Cylinders were charged with romite and dynamite respectively, the charge being 230 grains. Having been provided with ordinary fuses, the cylinders were tamped with dry sand and hermetically sealed with a lead plug. They were then firmly wedged in a strong iron frame, and the charges fired. It was found that the average of ten romite cylinders in volume after explosion showed 22.2 cubic inches, against 42 1/2 cubic inches of those charged with dynamite. This shows that the explosive force of dynamite was nearly twice that of romite. The specific weight of dynamite being also greater than that of romite, the former possesses higher concentration, which is a great advantage with explosives. The romite manufacturers, however, say that these experiments are far from being conclusive as to the relative merits of the two explosives, as, in order to give the greatest explosive force to romite, it must be inclosed in a solid case, which the soft lead cylinder is not considered to be. Further experiments with the two explosives are to be made in such a manner as may be desired by the makers of romite.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

QUARTZ MOUNTAIN.—Amador Ledger, Oct. 16: Machinery is fast arriving and being placed in position for the purpose of working the Quartz Mountain Overplus. Work has been commenced on the reservoir with a large force of men.

MINING EXCITEMENT.—There is much excitement in mining matters about six miles above Sutter creek, on the Volcano road. A few weeks back some prospectors named Leggett and Mandich Bros. discovered a ledge in that vicinity showing plentifully in free gold. They did some work on it and the quartz continued as rich as ever. They have bonded it to S. D. R. Stewart for \$10,000, and the new owner is now preparing to erect a six-stamp mill on the property. The same prospectors have also discovered another vein a short distance above, equally rich, and estimated from samples which have been shown us to yield over \$300 per ton. The whole country around has been located; one man having recorded ten locations.

FROM SUTTER CREEK.—Cor. Amador Ledger, Oct. 13: Repairing the Wildman shaft is completed and extracting rock is now in order. The mill was started a week ago and they expect to run it regularly. The ore is thought to be of a good paying character. There has been considerable excitement about the North Star mine within the past week; all hands being on a strike. They claim that it is customary in most mines to work the men till 12 o'clock Saturday night, and allow a shift for it, and in case, they work all night Saturday they are entitled to a shift and a half. The company, however, is only willing to pay for the work they perform. They have gone to Amador City, and succeeded in finding a set of men who have gone to work on the company's terms.

Calaveras.

THORN.—Calaveras Prospect, Oct. 13: Work on the Thorn mine is progressing finely under the management of P. S. Buckminster. Altaville and Angels have the appearance of an old-time mining camp. Everybody has plenty of money and men are as thick as bees.

Inyo.

CLOSED DOWN.—Inyo Index, Oct. 10: The Panamint Co. completed the run at their mill last week, and closed down for the season.

Los Angeles.

SAN FERNANDO DISTRICT.—Newhall Sentinel, Oct. 4: Newhall is in what is termed the San Fernando mining district. It extends from a line directly east from the tunnel about ten miles, taking in the Soledad canyon on the north. George Camp-ton is the Recorder. Prof. Von Keith, ex-Postmaster Green and Mr. Sampson, of Los Angeles, were visitors at the Cora Belle this week. The professor made several collections of slate, plumbago and soapstone, and found well-defined tracings of petroleum. A very fine vein of plumbago has been found in the San Francisco Canyon just above the Cora Belle. A company is now being formed to work it. The pulverizer made by J. B. Freeman of Los Angeles is now completed and will be put in operation in another week. It is to crush the clay and dirt before it enters the dirt washer, and will revolutionize mining in this district. At the Cora Belle mine a shoot has been arranged that pulverizes the dirt before it strikes the washer, and excellent results have been obtained. Two washers are now in operation day and night, and some fine gold is being taken out. Engineer Gavin has given his opinion, after having carefully surveyed the ground, that a hydraulic system could be put in at comparatively little expense. A reservoir with a capacity of 16,000,000 gallons can be made by removing only 800 yards of earth, and counting water-pipe, gates, etc., at a cost of \$2000. This will be done as soon as possible. The El Dorado mine, four miles above Clara Belle, has shown good development. A four-foot vein of silver, gold, and a red oxide has been struck, and a force of men is now at work. Richard Kitchline has purchased a fifth interest in the mine with Messrs. Smith and McDuffee.

Mariposa.

DULL.—Mariposa Gazette, Oct. 13: Business is exceedingly dull here at present. Owing to the low stage of water in the river the mill can run but five stamps. There are only ten men employed in the mine. The rock taken from the mine is excellent and no doubt pays well. New attachments are to be added to the mill soon. A new concentrator and two new mortars are on the road, and when they arrive will soon be put in place.

Nevada.

THE BRUNSWICK.—Transcript, Oct. 16: It is reported that the New York Co. prospecting the Brunswick mine in Grass Valley district will settle with their creditors and resume the sinking of the shaft. The plan is to follow the ledge down at least 300 feet more.

THE BANK STILL CAVING.—The 400-foot bank at the Manzanita gravel mine just north of town continues to cave, and another large mass of earth having chipped off Friday evening. There is no danger of the debris reaching the mouth of the entrance to the tunnel through which the drift miners are burrowing under the mountain, as it is over 700 feet from the face of the bank. The stuff now falling serves as a brace to prevent the mountain's weight from squeezing out the strata near the bedrock.

RICH QUARTZ.—At John Bonney's quartz claim on Piety Hill in this city some of the richest ore ever found in that locality is being taken out. The Bonney claim adjoins that owned by John Dower and sons.

KELLEY'S STRIKE.—Tidings, Oct. 13: The quartz strike on Thomas J. Kelley's property on Race street is quite an encouraging one. A six-inch formation, in which there is much solid quartz which shows sulphurets of good quality, lead and a sprinkling of coarse and fine free gold, was uncovered at a depth of 30 feet. Specimens of the ore shown us make the mineral showing above related, while a washing from a few cupfuls of the fine dirt revealed numerous particles of the coarse gold. Taking into consideration the superficial workings

the strike is quite important. With the ledge, water was encountered.

Placer.

VERY RICH.—Placer Republican, Oct. 6: The output of gold from the Brece & Wheeler mine at Bath during the past week has been something phenomenal, even for that rich and steady mine. The working place is about one mile and a half from the entrance to the tunnel, and the breast is probably 40 feet wide and six feet high. The bulk of the gravel is richer than usual, while the bedrock is covered with coarse gold, some of it actually going as high as \$1000 to the pan. The Brece & Wheeler is just now the Bonanza of California.

MAYFLOWER.—Republican, Oct. 10: The second upraise in the big tunnel of the Mayflower mine near Forest Hill was completed last week, and an abundance of very rich gravel was found. The first upraise was made about four months ago at 5200 feet from the mouth of the tunnel. Good prospects were found, but it proved to be too high on the rim. The present upraise is at the 5500-foot point and is 28 feet high from the incline. Supt. Chappellet broke through five days ago and found the gravel exactly the same as in the old Mayflower works three years ago, and prospecting about \$7 to the pan. A telegram received from him yesterday says it is growing richer and richer. At this point, however, the bedrock is still pitching a little to the east, so that the incline is being pushed on its present level about 50 feet further and then another upraise of 20 feet will be made through the bedrock into the channel. There is now no doubt that this third upraise will strike the lowest part of the channel, and the calculations made by Mr. Chappellet and Anthony Clark three years ago will have been verified almost to a foot. When they located the big tunnel in the Consolidated Justice, adjoining the old Mayflower ground, they estimated that it would have to be 5550 feet long and that it would bring them 60 feet under the channel. This low level was adopted so that a branch of the tunnel could be run down stream and all the lower ground be worked. But, to avoid a 60-foot upraise, an incline was made from the tunnel level so that the present works will be reached through an upraise of only 20 feet. This point is in the Consolidated Justice and between 1200 and 1500 feet from the old Mayflower works. The results of the last week are not only a triumph of engineering skill, but another proof of the extent of the main channel down the divide and the richness of the Con. Justice ground.

Shasta.

ORE.—Shasta Courier, Oct. 16: Supt. Everett, of the Little Nellie mine on Iron mountain, was in town Thursday. Their tunnel has passed through one ledge and tapped a second one. A lot of the ore has been sent below for milling test.

MILL.—The Utah Co., which owns the Florida group of mines, Old Diggings, is putting up a ten-stamp mill. The ore there is rich, but it cannot be successfully worked by the usual millio process; so say men who have had experience with ores of that rich district.

Sierra.

A BIG ENTERPRISE.—Sierra Tribune, Oct. 12: At the Red Chief quartz mine, six miles below Alleghany, an Eastern company is erecting a 40-stamp mill, and if everything goes well the stamps will be dropped about Dec. 1st. It is also proposed by the company to increase the plant next spring to 100 stamps. About 25 men are employed there at present. The vein at this mine is an immense one, and it is believed that it is destined to develop into a fine paying property.

THE SALINAS AND MERCER MINE.—At the Salinas and Mercer mine the work of pushing ahead the lower tunnel is progressing smoothly, and it is expected to encounter the vein in that quarter soon. When water comes the mill will be started up. By another season it is proposed by the company to build a reservoir which will hold enough water to last all the year. The directors held a meeting this week for the transaction of business.

THE KENTON MINE.—The Kenton mine on Kanaka creek, near Alleghany, is now owned by Horace Brown, and he and Jim Clinton are working there and running four stamps out of the 12-stamp mill. They have sunk 25 feet on the winze in tunnel No. 1. The ledge is six feet wide and assays from \$10 to \$50 a ton. The ore mills about \$10 a ton.

COLOMBO.—The work of hauling the Colombo mill over to the Buffalo mine was begun last Tuesday. Active work is going on at the mine in preparing to put up the mill.

Siskiyou.

QUARTZ.—Yreka Journal, Oct. 10: Mr. Geo. Clawson, who owns a fine ledge at Mill creek, near Scott river, was in town last week and showed us some exceedingly rich specimens of quartz, having pounded out some \$2500 from a small lot of such specimens. His ledge runs from 18 inches to four feet in width, throughout all of which gold can be seen with the naked eye. He is now prospecting with a small mill and will soon make arrangements to put up a large mill, as the ledge is firmly believed to be a permanent one. Mr. Chas. Abbott has been taking out considerable quartz from his ledge on Greenhorn during the past summer, which prospects well. He keeps up expenses by pounding out some of the richest specimens, and as soon as the winter rains commence to furnish water-power for running the custom-mills, will bail it for crushing. Messrs. Mike Finley, Henry Hutchings and Wm. Clark have discovered a rich ledge on the middle fork of Humboldt creek, near the ledge lately discovered by Jagers. They have sunk down about 40 feet and feel confident of finding a permanent ledge, at least they intend to make a thorough test to be sure of it. Geo. Simmons has a force working day and night on a new ledge at middle fork of Humboldt which he calls the Never Sweat mine. He thinks he has found a rich ledge and we hope his expectations may be fully realized. The Schroeder & Werner ledges at the head of Deadwood continue to pay well, with plenty of quartz to keep the mill going day and night, some 23 hands being employed. Next year it is expected the force will be doubled, as the mine will then be opened better for a larger force to work with good advantage.

Sutter.

WORK RESUMED.—Sutter City Enterprise, Sept. 28: The Sutter City M. Co. has decided to continue the work at the mine and has engaged the

services of three experienced miners, who commenced work last week. It is the intention of the company to tunnel under the hill at a depth of 90 feet. Work is progressing slowly at the present time owing to the presence of bad air in the shaft. The miners struck several small veins of coal this week of excellent quality, but in very small quantities.

Tuolumne.

LANE.—Union-Democrat, Oct. 13: The shaft at the Lane mine, Dickson's ranch, is now down 114 feet. The lead averages about 22 inches in width, is heavily sulphuretted and carries free gold. Very little exploration work as yet has been done, and throughout the entire shaft but one short drift has been run. The Bonanza mine, situated in the city of Sonora, is now being energetically developed. The mine is famous for its pockets of free gold, having produced hundreds of thousands of dollars, and especially for its fabulously rich tellurides of gold and silver—richer than those in any other mine in California, Colorado or any other country as far as now known. Tellurides from this mine lately treated by Mr. Louis Blanding gave, per ton, in gold and silver a total of \$65,160—gold, \$60,080; silver, \$5080. The steam Duplex pump recently placed in the mine is working with entire satisfaction. In the rear of the present steam pump a large chamber 9x16 feet has been excavated and timbered to admit the placing of the hoisting machinery. The primary engine on the outside is designed to run both the pump and the hoisting works. Wm. Van Ausdel is running the engine, Harry Medlicott the steam pump, and Blake Smith and Richard Jenkins have charge of the sinking of the new working shaft. The strong company which now holds a lease of the property will develop it. Louis Blanding has a most remarkable specimen from this mine, showing 9 metals and 4 minerals.

STRIKE.—Tuolumne Independent, Oct. 13: A rich strike has been made in the Platt mine, adjoining the Soulsby mine at Soulsbyville, fully up to the richest rock ever taken out of the famous Soulsby vein. This is at a depth of 200 feet. They are now putting in an engine and boiler, of 50-horse power, for pumping. A large double engine for hoisting is on the road and will soon be in place. Under the superintendency of Mr. Trittenbach, this mine will make a good record among the paying quartz veins of the county.

NEVADA.

Washoe District.

CON. CALIFORNIA & VIRGINIA.—Virginia Enterprise, Oct. 13: The usual amount of good milling ore is being extracted from the slopes on the 1400 and 1435 levels. On the 1200 level are stoping from the parallel north drift, 60 feet north of the upraise above that drift. Continue to stop ore from the southeast drift run from that upraise, 58 feet above the track floor. Good ore is still being taken from the slopes on the 1600 and 1650 levels. The usual amount of ore has been shipped to the mills and the pulp assays will average about the same as last week.

GOULO & CURRY.—The bodies of ore developed on the 200 level and the raise above the fifth floor of the 400 level continue to look well. The exploring drifts are passing into material of a favorable appearance.

CONFIDENCE.—Repair work is about completed. All will be in good shape both underground and on the surface when the extraction of ore is resumed. The prospecting drifts have opened some good ground.

BEST & BELCHER.—The winze that is being sunk on the north drift from west crosscut No. 1, from the main northwest drift, is down about eight feet and shows from four to five feet of excellent milling ore.

CROWN POINT.—The 700 north drift advanced 30 feet during the past week and is now 94 feet south of the crosscut. The face is in porphyry and seams of clay. The Suto tunnel drift is out 71 feet.

BELCHER.—On the 200 level the north drift from the shaft is out 32 feet. It is in a promising formation of soft porphyry. The 850 station is being repaired and repairs are being made to chutes.

UNION CON. AND MEXICAN.—On the 1465 level a joint Union drift started from the east drift from the Ophir shaft at a point 150 feet in, has crossed the line and entered Mexican ground.

HALE & NORCROSS.—The southwest prospecting drift from the 15th floor above the 700 level has been extended 40 feet. The main west drift, 800 level, has been advanced 42 feet.

BALTIMORE.—Prospecting operations are still vigorously prosecuted on the 338 level in ground of a very promising character. A considerable amount of ore is being accumulated.

OPHIR.—On the 1465 level the south drift started from the end of the old east drift from the shaft station, 300 feet in, is extended 67 feet and is in soft porphyry.

SAVAGE.—From the 400 and 500 levels are extracting about 50 tons of ore per day, which is being shipped to the Rock Point mill.

OCCIDENTAL.—Extracted 112 tons of ore and shipped to the Atlanta mill 135 tons; average assay value of wagon samples, \$22.50.

CHOLLAR.—The face of the west drift on the 350 level is still in promising ground, consisting mainly of clay and porphyry.

POTOSI.—The face of the south drift on the 650 level is still in a mixture of vein material that gives low assays.

ALPHA AND EXCHEQUER.—On the 382 levels of these mines the usual prospecting drifts are being run.

SIERRA NEVADA.—No. 3 crosscut on the 520 level is out 580 feet. The face continues in porphyry.

SEG. BELCHER.—The only work being done is in the upraise. It is still in favorable ground.

ALTA.—Are still engaged in making repairs to the main shaft and to the hoisting works building.

YELLOW JACKET.—A good deal of repair work of various kinds is in progress.

SCORPION.—The usual progress is making in crosscut No. 1 on the 300 level.

LADY WASHINGTON.—The raise above the 725 level is making good progress.

UTAH.—On the 472 level in the north lateral drift, 73 feet north of east crosscut No. 1, east crosscut

No. 2 has been extended 50 feet; total length, 80 feet. The formation is porphyry, clay and quartz.

JUSTICE.—Work on the new mill is being rushed as rapidly as possible.

BULLION.—Work in the drifts on the 500 and 600 levels is continued.

KEYSTONE.—The sinking of the shaft is progressing favorably.

OVERMAN.—Are exploring below the tunnel level.

ANDES.—Are repairing the main shaft.

Lodi District.

SHIPPING ORE.—Belmont Courier, Oct. 13: Alfred Welch is shipping rich ore from Lodi to San Francisco for treatment.

Palmetto District.

BEING OPENED.—Hawthorne Bulletin, Oct. 10: The group of mines known as the Palmetto syndicate, situated at Palmetto, are being systematically opened up under the energetic management of Mr. R. B. Catherwood, who has lately assumed control of operations. These mines are owned by a syndicate of well-known wealthy New York capitalists. They have recently spent a large amount of money in improvements. A 12-ton mill and all the appliances for lixiviation process, by which the ore will be treated, are now in full working order, ready to start up at a moment's notice. Recent developments in the mines have been such as to create a ripple of excitement in local mining circles, the workings of ore giving astonishing returns in gold. General appearances indicate that as depth is attained gold values will predominate, the quartz being of an exceedingly lively character. Large boulders are found now and then in the working formation, and from one of them a working of some 28 ounces of rock gave a bullion return of \$40 in gold and \$120 in silver, a total value of \$32,000 in gold and \$1230 in silver to the ton. The property consists of 18 different mines, all more or less developed and all covered by U. S. patent.

Seligman District.

TUNNEL.—Tuscarora Times-Review, Oct. 12: A tunnel at Seligman has been started to tap the vein at a depth of 1000 feet. Eight-hour shifts and Burleigh drills are employed.

Tybo District.

DIMICK.—Belmont Courier, Oct. 13: The Dimick mine, Tybo, continues to yield rich ore.

ARIZONA.

ORE SHIPMENT.—Prescott Courier, Oct. 10: George Wickler will very soon make a large shipment from the White Spar mine. Aleck Thompson has finished moving a lot of machinery to the mountains. Riggs & Lawler, of the Hillside, are constantly shipping rich ore. Seven tons of ore from one of Bigelow & Smith's mines, sampled over \$90 to the ton. John Curtin has located the Ben Harrison mine in Hassayampa district. It is a very promising vein. Mr. Britton of the Boaz Co. says the mine is looking well; mill will start in about ten days.

AT BISBEE.—Democrat, Oct. 11: The hoisting works, together with all the machinery of the Czar mine, are being removed several feet back from their present location. In the meanwhile the ores from that property are hoisted through the shafts of the Queen and Holbrook. This necessitates an additional amount of work, but it will be remedied in a few days. Monday night the water pipe connected with the large smelter broke very suddenly, necessitating its being closed down for a few days, after which it will be in full blast again turning out its usual quota of bullion.

THE RATTLESNAKE.—Tombstone Epitaph, Oct. 8: Supt. Coffman states that three wagon-loads of machinery for the Rattlesnake mine are lying at Durkee's corral, and three more lying at Fairbanks. The reason for the delay is that on account of the massiveness of the machinery, new approaches to the mine will have to be made. The 400-foot level has been reached in the main shaft; a station is being cut out, and drifting to connect with the old shaft is in progress.

SILVER BASIN.—Clifton Clarion, Oct. 10: Frank Baxter was down from Silver Basin last week, purchasing supplies. Mr. Baxter reports the mines as still improving, and that another shipment will shortly be made.

GREENLEE.—Capt. J. Fletcher and Jas. Transue of New Mexico have purchased from A. S. Hickey at a good figure the splendid gold property in the Greenlee district known as the Silver Tip. The purchasers have for some time been examining prospects in the above district, and as both are old and experienced miners and millmen, the sale speaks well for the future outlook in that region.

MILL.—That Clifton will soon have a stamp-mill is now an assured fact. J. H. Hovey and B. F. Harrower returned from their trip to Globe last Saturday. Mr. Hovey informs us that he purchased during his absence a 5-stamp mill, and that the same is now on the road here. It will be erected on the Coon mine on Chase creek, upon which a force of men will be put at work immediately extracting ore.

GOLO GULCH.—Messrs. Paxton & Jenkins are reported to be taking out some fine ore from the Pittsburgh claim in Gold gulch, on which they have a lease from Messrs. Baxter & Whittington.

COLORADO.

MILL AND MINE.—Silverton Miner, Oct. 8: The Golden Chicken mill, in Turkey creek basin, has started up again on Gold King ore, also Crown Jewel. On the Sunnyside extension about a dozen men are employed, all taking out ore. The Turkey Creek Mining Co. have resumed work on their property in Turkey creek basin and will soon ship 100 tons to the Golden Chicken mill. The Adirondack, owned by J. H. Fessenden, has been leased to J. K. Machner. William Sullivan is working the Bandora, on the south fork of Mineral. The Tyrol will commence shipping and laying in winter supplies next week. Messrs. May and Levis shipped 11 tons of mineral from the Margie, above Chattanooga, this week which gave the excellent returns of 16 ozs. silver, one-tenth oz. gold and 66 per cent lead. Work on the Arctic in Cascade basin on Boulder mountain, has been suspended for the winter, and the owners, Messrs. Massey and Galvin, are greatly pleased with their season's work. Another claim on the celebrat-

ed Letter G vein on Kendall is coming to the front as a producer. This time it is the Pyramid lode, owned by Mrs. A. L. Cotton. The mill built for the Sunnyside mine has been run for some days with perfect success, and the Thompsons are elated at what will result in a profitable enterprise to them. The mill has ten stamps, weighing about 725 pounds with plates, and for concentrating the tailings there are two percussion tables such as are used about Central and Black Hawk, and with which Fisher's mill is also fitted. The work done by these tables is excellent. The mine has been systematically worked in preparation of supplying the mill to its largest capacity. The cost of milling will not exceed \$2 per ton, which will leave a very handsome margin of profit.

CHLORIDES.—Denver Review, Oct. 11: The latest excitement at Aspen is over a discovery made by James Casey, a well-known prospector, in the Silver Star mine. Some ten days ago the lessees were on the point of giving up their lease, and Mr. Casey was looking over the mine when he found indications of mineral. He then went to the lessees and tried to get an assignment of their lease. In the course of his negotiations with them he incautiously suggested that they let him have the lower end of the claim. On the 9th inst., the lessees concluded to give up their work and turn the claim over to Casey. They gathered up their tools and prepared to quit, but before going in town they concluded to look over the lower end of the claim. While there they stumbled on Casey's outcrop. Taking their tools down there, they went to work, and in a short while they had a showing that would make a miner's heart glad to look at. A mass of chlorides extended on every side wherever the soil was shoveled off. Some of the mineral was taken in Aspen and assayed 2000 ounces to the ton. Mr. Casey has been watching the bonanza he missed, and says they shoveled out \$4000 worth during the afternoon. It looks like a second Bonnybell, but is not yet sufficiently developed to justify any estimate of its value.

DAKOTA.

GALENA SMELTER.—Deadwood Pioneer, Oct. 10: Sheridan McBratney from Galena reports that the Queen Co. has already delivered 250 tons of ore to the smelter. Negotiations have closed and Mr. W. E. Terhune, formerly of the Iron Hill, has been employed to come out and assume charge of the plant. Mr. Terhune has already started from New York for the Hills and is due to arrive here now at any time. The fact that his services have been secured seems to assure the success of the undertaking, and all things now point to a profitable career for the gentlemen at the head of the enterprise. As has been more than once stated, Galena has a half dozen or more mines that can be operated to a good profit whenever a home market shall appear for the ores. Among them are the Queen, Horseshoe, Hayes, Bullion, Merritt and Cora. Developments on each are extensive and large ore bodies are disclosed. With the smelter in operation and a purchaser of ores at fair valuation, work on these mines will be on a larger scale than ever. Employment will be given a number of men and the camp must therefore prosper. The Castle Chief mine is looking splendidly, the ore body widening as it is followed. The 20-stamp mill is constantly pounding away, and it is anticipated that the October cleanup will be the largest yet made.

IDAHO.

KETCHUM SHIPMENTS.—Ketchum Keystone, Oct. 10: Shipments of ore and bullion from the Ketchum station during the past week aggregated 20 carloads, consisting of North Star, Sheep mountain, and Custer county ores, and Ramshorn and Clayton bullion. A gentleman named Clark discovered a fine silver-lead vein on Thompson creek, a branch of Warm Springs creek, a few days ago and got an assay of over 300 ounces from the croppings. Several lots of Sheep mountain ore have been sold to the First National bank in the past two weeks, and Kemp's pack-train is on the way in with another load. The cost of packing ore from the Sheep mountain country to Ketchum has recently been raised from \$35 to \$40, owing, presumably, to the lateness of the season and the danger of storms in the mountains. Milt Mounning sold the First National bank about three tons of ore from the Wood river claim last Tuesday, from which he received very good returns. His prospect is situated west of Boyle mountain, on Warm Springs creek. Mr. J. C. Fox of Custer county was interviewed by a representative of the Keystone yesterday relative to the newspaper report that he and others intended to put a smelting plant into the Sheep mountain country this fall. Mr. Fox says that this is not the case. They have contemplated the project of smelters for that district, but have done nothing thus far toward acting on the proposition, and will not do so before spring.

SIXTY-TON STACK FOR CLAYTON.—Challis Messenger, Oct. 10: A. J. Crook returned from Salt Lake several days ago. While gone, he ordered a 60-ton smelter for Clayton, and the machinery is now on the road. Work on the foundation and masonry has been commenced and they will be pushed to completion at an early day. As soon as the machinery arrives, it is to be placed in position, and the new smelter is expected to be in active operation before the beginning of the new year. Mr. Crook is also negotiating for the purchase of the Bellevue smelter, a 40-ton stack erected near that place some years ago, but which was never used. If this purchase is made, when all are placed in position, the Clayton smelters will have a capacity of 140 tons per day, and candid, sober-minded miners, who have examined their properties, say that the mines of the company on Ramshorn Hill and Kinickinnick and Slate creeks warrant them in putting up stacks of that capacity.

MONTANA.

BOULDER DISTRICT.—Mining Review, Oct. 8: In the above district, located in the vicinity of the famous Granite Mountain section, a good deal of prospecting is now going on with very encouraging results, and the possibilities for the district are indeed flattering. It will probably not be long now before some of these properties will be ranking among the paying mines of the Territory. Messrs. Connolly & Cole, who are working the Princeton

mine under a lease, are taking out and shipping some very fine ore. The Deer Lodge M. and Reduction Co. suspended work on their mine known as the Nonpareil, this action being taken because of lack of facilities for treating the ore, of which there is a large quantity of a smelting nature on the dump. The company is now contemplating the erection of a smelter on the ground. On the Traviola development work is being actively prosecuted, and a tunnel is being run to strike an ore body which it is expected will be encountered in the next 50 feet, the tunnel already having been run a distance of 200 feet. In a crosscut about 50 feet from the header of the tunnel, nearly four feet of good paying ore is reported in sight. A large quantity of ore is on the dump of the valuable property belonging to Messrs. Bradley and Sullivan, who intend to soon commence the shipment of ore, a wagon-road now being constructed for the purpose of hauling ore to the railroad station.

OLD CONFEDERATE GULCH.—This gulch was discovered in 1865, and lies east of the Missouri river, about 22 miles from Helena. From three of the bars or benches that lie above the bed of this gulch, about \$3,000,000 were taken out within some three years. From Montana bar, the Wheeler party, consisting of four men, took out, in a single season, \$600,000, or nearly half the aggregate product of the whole gulch. A single panful of dirt taken from the diggings contained \$1585 of dust. The Diamond Flume & Hydraulic Co. is now engaged in working over this same territory, with an equipment said to be as complete as any in Montana. Their ditches have a capacity of nearly 5000 inches of water, and a pressure of over 400 feet, and the chances are that this region will yet add considerably to the gold product of the Territory.

NEW MEXICO.

DEVELOPMENT WORK.—Silver City Enterprise, Oct. 12: A recent shipment of eight tons of ore made by R. Johnson from the Old Man mine, netted \$319 per ton. This does not look as though the mine was worked out. Harry Hermann, the new superintendent of the Sheridan & Peacock Companies in the Mogollons, brought in a brick this week weighing 125 pounds. Besides the silver, it contains considerable gold, which will run the value of the brick up to about \$2500. Three-fourths of the ore for this brick came from the Sheridan mine, which several experts condemned as worthless. Mr. Hermann is satisfied that the mine will pay, and predicts that Cooney will yet be the biggest camp in the Territory. On Friday morning another brick arrived which weighed 87 pounds.

CLIFTON.—James Smith, who came in from Clifton last night, reports that affairs were pretty lively there for a time. Mr. Calhoun, who at one time had been assistant superintendent at the mines, was let out by Lawrence Russell. Mr. Calhoun went to Scotland and succeeded in having himself appointed as general superintendent vice Mr. Russell. He came out to Clifton with one of the directors with the authority to take charge. As soon as the men learned of the change, they all quit, including those employed on the road. After a day or two Mr. Russell was again put in charge, and everything is again moving on smoothly.

OREGON.

LA BELLEVUE.—Bedrock Democrat, Oct. 8: J. B. Cabell, owner of La Bellevue mine, at Granite district, reports the machinery for the Golden Gate concentrator, recently purchased by him in San Francisco, nearly ready for work and expects to begin reducing ore about the middle of the month. There are upward of 2000 tons of fine milling ore on the dump and hundreds of tons in sight in the mine. The mill is about one-half mile from the mine with good down-grade road connecting them. Thirty tons of ore daily are being delivered at the mill, and by the time the mill starts there will be sufficient ore on hand to keep it running constantly for an indefinite time. Great things are expected of the La Bellevue mine from the fact that it is one of the best developed mines in Oregon, having been worked constantly for the past 15 years. The ore veins are wide and the tunnels and shafts are so constructed as to afford an economical working. The La Bellevue is one of the permanent ore-producing mines of the Pacific Coast, and from the time the mill starts this month it will show up its merits in a manner that will prove conclusively that it is a dividend-paying mine.

UTAH.

REVIEW.—Salt Lake Tribune, Oct. 13: The receipts in this city for the week ending October 10th, inclusive, were to the value of \$120,123.18, of which \$79,563.67 was in bullion and \$40,559.51 was in ore. For the previous week the receipts were \$87,221.70 in ore and \$82,137.24 in bullion a total of \$169,358.94. The Ontario product for the week was of bullion, 12 961.50 fine ounces; from ore sales, \$24,508.45, an approximate total of \$37,469.95. The daily output for the week was 10,810.72 fine ounces of bullion; no ore sales. The Horn Silver has made no sign locally under the change of directorate. Fine bar receipts for the week were to the value of \$10,810.72. Base bullion received was valued at \$41,812.74. The Hanauer smelter produced during the week bullion valued at \$10,270; the Germania, \$16,670.21. Ore receipts in this city for the week were \$36,059.51 in value by Wells, Fargo & Co., and \$4500 by McCormick & Co.

BEAVER COUNTY.—Salt Lake Tribune, Oct. 10: W. S. Martin is up from Beaver county looking after a carload of ore just shipped. He is sending an average of one carload of ore per week to this city from his Talisman mine, a few miles from Milford. He reports a late strike of two feet of ore in the mine, which runs 119 ounces silver and 30 per cent lead. The upper workings of the mine had two veins 30 feet apart, but these seem to be concentrating into one, as they are getting close together in the lower workings, and there are good indications of the Talisman becoming one of the best properties in Star district.

MILFORD.—J. T. Kelly is up from Milford with six tons of ore from his Anvil mine. This property promises to soon become a regular shipper. It runs about 135 ounces silver and 30 per cent lead,

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in DEWEY & Co.'s Patent Office Library, 220 Market St., S. F.

FOR WEEK ENDING OCT. 9, 1888.

- 390,834.—LIFTING JACK—N. Beauregard, S. F.
- 390,772.—GRAIN SEPARATOR—W. L. Gilson, McMinnville, Ogn.
- 390,959.—FRUIT-DRIER—Wm. Grey, San Jose, Cal.

- 390,920.—HOSE BRIDGE—Tucker & Keegan, S. F.
- 390,929.—MOTOR—G. F. Wells, S. F.
- 390,732.—FIRE-PROOF BUILDINGS—E. J. Weston, S. F.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

BICYCLE.—William F. Stevens, S. F. No. 390,916. Dated Oct. 9, 1888. The improvement in this machine consist in the peculiar frame, a novel arrangement of springs by which the frame is suspended and connected with the wheels, a novel driving mechanism and minor features of construction.

FRUIT DRIER.—William Grey, San Jose, Cal. No. 390,959. Dated Oct. 9, 1888. This drier belongs to that class of fruit-driers in which the baskets or fruit receptacles are suspended from a wheel which rotates within a heated shell. The improvement in this drier consist in the novel arrangement of fire-chamber and connected flues, and the air pipes passing through the shell.

DUMP-CAR.—Levi Jacob Lewie, S. F. No. 390,867. Dated Oct. 9, 1888. In this car the load is discharged by opening the bottom. The car is made with a bottom having one or more sections, and has a drag-ropes tongue connected with it. Springs and holding arms or trips, and a means for automatically opening the trips are employed so as to relieve the bottom and let it drop to discharge the load.

SASH HOLDER.—William Mathews, Alameda, Cal. No. 390,878. Dated Oct. 9, 1888. This holder looks the window in position, either opened or closed. It consists of a double inclined piece pivoted within a casing on the top of the lower sash. A cylinder or roller lies within the face of the double inclined piece, and is caused to press against the upper sash by means of a screw which sets up the piece. The locking effect of the roller does not depend upon the pressure of the screw, but upon the hindering action of the roller between the sash and the inclined piece.

ORCHARD AND VINEYARD CULTIVATOR.—John Morgan, Santa Clara, Cal. No. 390,305. Dated Oct. 2, 1888. This implement, as its name implies, is for use in orchards and vineyards. It has a novel frame made of har iron. To the sides of the frame are adjutably connected hars which carry supplementary teeth. These may be taken off or put on at pleasure to vary the width of the machine. The pole or tongue is adjutably connected to suit different sizes of horses, and the wheels and connections are adjustable to keep the draft low. The peculiar shape of the frame provides for the proper location of the several teeth, so that all the ground will be properly passed over.

DEVICE FOR CATCHING STOCK.—Francis Marian Anahle, Rocklin, Cal. No. 390,331. Dated Oct. 2, 1888. This invention belongs to that class of devices for catching animals from a distance, in which pivoted jaws, adapted to grip the leg of the animal, are extended upon a long pole and are operated by means of a cord. In this implement one of the jaws is provided on its shank or stem with ratchet teeth, and the other jaw has connected with its end a link which embraces the shank or stem of the first jaw and engages its teeth, the link being operated by a cord attached to its free end. The advantage of this device are that it can be readily used, and that when once applied it holds, no matter whether the animal moves from or toward the operator.

CABLE GRIP.—Robert A. McLellan, S. F. No. 390,882. Dated Oct. 9, 1888. This grip is of the class commonly known as "center" or

"bottom" grips. The general object of this improved grip is to simplify the construction and reduce the cost of manufacture and repairs. Particular objects are to avoid lost motion in the ewing of the jaws, to reduce the number of joints and thereby have less liability to looseness and rattling, to avoid the use of an independent device for compensating for the wear of the dies, and to so connect the operating lever that its power of leverage may be the same in any position. The improvement consists in a novel hinge connection for the jaws and in a novel connection for the lever foot.

SPRAY NOZZLE.—Lester D. Greene and John Crofton, Walnut Grove, and Geo. B. Greene, Cortland, Cal., said Lester D. Greene and John Crofton assignors to said Geo. B. Greene. No. 390,474. Dated Oct. 2, 1888. This nozzle is a tip for forming and ejecting a spray, and is for use in the treatment of fruit trees, vines and shrubs. The object attained by this device is the formation and discharge of the spray in the most serviceable shape and from the most convenient point; also the thorough and easy clearing out of the ports when they become obstructed. It is composed of a hollow-shaped shell having a spray port in front, and one on one side, and a discharge hole on the other side, and a rotary plug, fitted to the shell, and having a port of large diameter, communicating at right angles with a port of small diameter. In the larger port, which is the outlet port, the liquid fed to it through the smaller port and confined by the small spray port of the shell, acquires a kind of spiral or rotary motion and is ejected in the shape of a broad cone or funnel, instead of in a flat fan shape, as is usual, and the angular location of the larger port with respect to the smaller port insures this spiral or rotary motion.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco.

LIVERMORE VALLEY R. R. Co., Oct. 15. Object, to construct a road from the town of Livermore to the Livermore coal mines. The capital stock is \$1,000,000. Directors—J. N. Knowles, Israel Lawton, I. W. Taher, E. Dunham, D. Guttman, G. W. Comegys and B. Noyes.

PACIFIC PACKING Co., Oct. 15. Capital stock, \$100,000. Directors—Lionel Sloes, Chas. Hirsch, Louis Sloes, Jr., Ben Arnold and G. Niehaum.

ROYAL PACKING Co., Oct. 15. Capital stock, \$100,000. Directors—Lionel Sloes, C. Hirsch, Louis Sloes, Jr., Ben Arnold and G. Niehaum.

AMERICAN PATENT GAS RANGE AND LIQUID FUEL Co., Oct. 16: Object, to manufacture and deal in gas and gasoline ranges, stoves, etc., constructed upon the principles of the Whorff patent. Capital stock, \$500,000, in 100,000 shares. Directors—F. A. Huntington, J. N. E. Wilson, W. E. Mighell, Franklin P. Bull and W. H. Davis.

PACIFIC EDISON PHONOGRAPH Co., Oct. 17. Capital stock, \$300,000. Object, to continue the commercial and manufacturing business of H. P. Gregory & Co. in California, Oregon, Australia, etc., as dealers in iron and wood-working machinery, etc. Directors—Elise McClure Gregory, Tyler Henshaw, Chas. P. Belle of Oakland, Henry Shaw Smith of Sydney, Australia, and Sidney S. Palmer of Portland, Or.

SMYRNA COLONY ASSOCIATION. Oct. 17. Capital stock, \$90,000. Directors—Geo. H. Foster, W. B. Wilsbire, Geo. A. Raymond, C. O. Carpenter and E. Brown.

Mining Share Market.

For the first time in some months there has been, during the past week, some activity in the mining share market. Business has been very lively and many shares have changed hands at comparatively good prices. News received from Beet and Bolshoer state that it will take a few days more to complete the etation at the head of the winz, and when it is finished they will sink on the new development. The Mexican mill is expected to start up on Norcross ore at an early date, and at the Nevada mill a long string of new blanket sluices has been put in preparatory to the resumption of ore reduction. The mill will start up with 20 additional stamps. The Virginia Enterprise says: A valuable development at this time—just when the water-supply in the Cereon river is rapidly increasing and the mills are beginning to start up—would cause quite a boom in the Comstock shares.

Good progress is being made in the work of setting up the electric apparatus by means of which the power of the Pelton wheels on the Sutro tunnel level of the Chollar mine will be transmitted to the Nevada mill.

Bullion Shipments.

We quote shipments since our last, and shall hereafter to receive further reports:

Eureka Con., Oct. 16, \$20,000; Sheridan (N. M.), 12, \$2500; Young America (Sierra Co.), for September, \$25,000; Howard (A. T.), 12, \$6834; Cons. California and Virginia, 16, \$60,000; Hananer, 13, \$3350; Germania, 13, \$3462; Hananer, 13, \$1660; Germania, 11, \$4020; Hananer, 11, \$1670; Mt. Diablo, \$7313.

MILL SUPPLIES AND LUBRICATING OILS.

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; is in successful operation and we guarantee its work as represented.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

FRISBEE-LUCOP MILL COMPANY,

GIDEON FRISBEE, Manager, - - - 461 Howard St., San Francisco.

HOOKER & LAWRENCE, Gen'l Ag'ts, 145 Broadway, New York.

THE DOUBLE "ECONOMIC" STAMP MILL.

We have here the Stamp Mill in a cheap and simple form. The high drop of the old stamp is more than compensated for by the great weight (1200 lbs. each) of our stamps, and the rapidity (300 strokes each per minute) with which they run. There are 4 shoes in each stamp, so that there are 4800 strokes of the shoes on the dies per minute. Less power is required than in any other mill to do the same amount of work.

The Mortar has screens at both ends, giving ample discharge. There are no cams or tappets to wear or be adjusted. The stamps adjust themselves as the shoes wear.

AN AUTOMATIC ORE FEEDER

Goes with each Mill. We also have a suitable

Rock Breaker.

Several Mills are now in the mines doing excellent work. The "Economic" is not only a mill for small mines, but we believe it is destined to SUPERSEDE THE OLD STAMP IN MILLS OF THE LARGEST CAPACITY.

IMPROVED FORM OF HYDRAULIC GIANTS.

THE ABOVE CUT ILLUSTRATES THE IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS which we manufacture. We guarantee purchasers of this form of Giants against all costs, expenses or damages which may arise from any adverse suits or actions at law. We are further prepared to furnish Single-Jointed Giants when required. Prices, discounts and Catalogues of our specialties of Hydraulic Mining Machinery sent on application.

JOSHUA HENDY MACHINE WORKS, 39 to 51 Fremont St., San Francisco.

**HOSKIN'S**

IMPROVED

ONE-JOINTED

HYDRAULIC MACHINE.

The statement of Mr. Joshua Hendy that ANY STYLE of machine is an infringement on any style manufactured by him, he knows to be also utterly false. The Supreme Court of the United States on March 19th decided that the pretended patent for infringing, which he has for years been fleecing miners for royalty, is ABSOLUTELY VOID, with costs of suit to Hendy & Fisher. I am the inventor of all styles in use, and am prepared to fill orders to suit customers. Send for list of prices of Hydraulic Machinery. R. HOSKIN, Empire Foundry, Marysville, Cal.

STURTEVANT MILL.

This Mill as a Crusher and Pulverizer is without rival.
Is in operation in leading smelting works and mills.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

MARKET REPORTS.

Local Market.

SAN FRANCISCO, Oct. 18, 1888.

SILVER—The market abroad fluctuated slightly the past week, closing firm at 93½c in New York. Our market has shown a fair degree of activity, but, as a rule, buyers' views are said to be considerably below the parity of the London market. Several sales are reported to have been made for China and India at 93¼ to 93½c. In last month there was imported into this port silver as follows: Foreign coin, \$63,904; American coin, \$75; foreign bullion, \$262,359. It is claimed by those in position to know that there will be a large increase in the silver output of the mines on this coast, principally from those in Nevada. It is asserted with great confidence that the output of bullion of the Comstock mines in Nevada, alone, will average fully, if not over, \$2,500,000 this winter, but what the percentage will be in silver it is difficult to say. Many are inclined to the opinion that the ore developments on the Red lode (west of the Bonanza lode) contain a larger percentage of gold than did the latter lode.

The following table shows the amount of silver bullion in the principal European banks Sept. 27th, and at the corresponding date last year:

Banks of	1888.	1887.
France.....	£49,234,560	£47,783,398
Germany.....	15,846,568	14,868,000
Austria-Hungary.....	15,337,000	14,479,000
Netherlands.....	7,719,000	6,170,000
Nat. Belgium.....	1,215,000	1,216,000
Nat. Italy.....	1,115,000	1,118,000
Totals.....	£90,129,226	£87,664,398
Totals, previous week.....	89,199,560	88,469,790

QUICKSILVER—The market has ruled easy throughout the week. As usual, with a degree of weakness in the market, buyers act cautiously, and are only tempted to take freely by concessions from sellers. The distant mining districts, away from railroad communication, are buying winter supplies, but other mining centers buy lightly. The export demand is fair.

The local market closed very strong to-day at \$45 to \$47.50, in sympathy with a cable from Europe, reporting higher prices.

IRON—Importers claim that so far this year the consumption on this coast, particularly in this city, is largely in excess of the like time last year. The stock here is small, having gone into consumption. The production of the mines on Puget Sound is contracted to a new rolling-mill that is being erected there. The iron market abroad and at the East is reported to be very strong.

LEAD—The market is strong at full prices. The output of the coast, at present, is not up to what is looked for in the near future. Shot is very strong at the late advances. It is claimed that the shot manufacturers here and at the East have entered into an agreement to maintain prices on a higher level so as to net a profit—heretofore they barely met current expenses.

CHROME IRON ORE—The output of this State is about 5000 tons a year, which is marketed at the East, owing to the high price of coal in this city. There is hardly a county in this State where it is not found. At present the chief source of supply is in San Luis Obispo county and Placer county.

TIN—Spot continues dull and easy. To arrive is also heavy, but for prompt shipment there is a good demand for plate from salmon and fruit canners for next year's business. Prices were advanced to \$5.15 for prompt shipment, but at the close it is said that this can be shaded by larger buyers.

COPPER—There is very little of special interest to note. The demand is fair, with prices well maintained.

COAL—Importers continue to report a strong market. They claim that a higher range of values is not at all unlikely in the near future. Several large consumers claim that families, hotels, etc., are better stocked than at this time in 1887. They bought under the impression that there would be a coal famine. The consumption will depend largely upon the character of the winter—whether very cold or moderately cold. The yards in the Southern part of the State are like the yards here, full.

BORAX—The market is quiet, but steady at quotations.

Eastern Metal Markets.

By Telegraph.

NEW YORK, Oct. 18, 1888.—The following are the closing prices the past week:

	Silver.	Copper.	Lead.	Tin.
Thursday.....	93½	\$17.45	\$1.90	\$23.50
Friday.....	93½	17.45	1.90	22.20
Saturday.....	93½	17.45	1.90	23.00
Sunday.....	93½	17.40	1.90	22.90
Tuesday.....	93½	17.45	1.90	23.00
Wednesday.....	93½	17.45	1.90	23.25

The market closes as follows: Quicksilver is steady at from 60¢ to 63¢.

Borax is in fair demand from the manufacturers at fully the last figures.

Lake Ingot copper is dull. It is offered at 17½c for early 1889 delivery. The next three months' options may be quoted at about 17½c. The syndicate supplies consumers at about 16½c to 16¾c. Outside sellers offer small lots in casks at 17 to 17½c. Casting brands are slow in sale, but firm at 16c.

Pig lead is speculatively quoted for November at \$4 92½ to \$4 95. Closing weak.

Tin is very firm at an advance.

By Mail.

The following is the latest from the "New York Metal Exchange Market Report":

TIN—Cable quotations declined until yesterday, when the foreign market closed firmer; and we have followed the cue given from London and improved on it; futures losing 60 points in the first four days; and recovering 35 yesterday, from which 5 points were lost again to-day. Spot has ruled proportionately more steady, as a result of small stocks. Sales have run up to a total of 135 tons, and a more spirited tone has pervaded the trading. To-day was quiet and steady.

COPPER—Remains hopelessly stagnant, only 75,000 pounds changing hands on the floor; but

values have to a slight degree softened during the week.

LEAD—On a decline in prices of 30 points, transactions ran up to 1350 tons, and 250 tons more have been done on the quick recovery made of 20 points from the lowest figures reached. Closes firm but quiet.

SPELTER—Opened firm but dull on Monday, holding barely steady for several days, and weakening 5 or 10 points toward the close; but did not become active at any time.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, term of subscription, and give it their own patronage, and as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for, let him not fail to write us direct to stop it. A point card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

DELINQUENT SALE NOTICE.

Gray Eagle Mining Company.—Location of principal place of business, San Francisco, California. Location of works, Placer county, California. NOTICE—There are delinquent upon the following described stock, on account of Assessment (No. 1) levied on the 4th day of September, 1888, the several amounts set opposite the names of the respective Shareholders, as follows:

Names.	No. Certificate.	Shares.	Amount.
D. Bowers.....	73	600	\$26.00
Wm. Mc Coy.....	329	40	2.00
Theo. Wetzel, Trustee.....	364	8	.40

And in accordance with law, and an order of the Board of Directors, made on the fourth day of September, 1888, so many shares of each parcel of such stock as may be necessary, will be sold at public auction at the office of the Company, room 9, No. 327 Pine street, San Francisco, Cal., on Tuesday, the thirtieth (30) day of October, 1888, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

O. H. BOGART, Secretary.

OFFICE—Room 9, No. 327 Pine St., San Francisco, Cal.

Jewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY. presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

—FOR—

Working Refractory Gold and Silver Ores.

We are now prepared to receive Ore at our Testing and Mining Mill, Meriden, Conn., in sample lots of 500 pounds, to be worked by the Wheeler Process, where we have succeeded in saving 90 per cent of the metal contained in the ore.

We work sample lots free of charge and report results.
THE NEW CHEMICAL GOLD MINING CO., Box 939, Meriden, Conn.

**WINANS' ANTI-INCORUSTATION POWDER
Or Boiler Compound**

For Removing or Preventing Scale, Corrosion and Pitting in Steam Boilers. Send for references. Also PERLINS RUBBER M'g Co. Plumbago Sheet, and Piston and Valve Rod Packing, to be had only of J. C. WINANS, 220 Fremont St., S. F., Cal.

THE ROLLER ORE FEEDER

(Patented May 23, 1882.)

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required. In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

Golden State and Miners' Iron Works,
Sole Manufacturers,
527 First Street, San Francisco, Cal.

San Francisco Cordage Factory.

Established 1858

Constantly on hand a full assortment of Manila Rope, Sisal Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc.

Extra sizes and lengths made to order on short notice
TUBBS & CO.
611 and 613 Front St., San Francisco.

JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 FREMONT STREET, SAN FRANCISCO, CAL.

"HENDY" IMPROVED "CHALLENGE" ORE FEEDER.

The best form of Feeder ever devised, and pronounced by reputable mining men to be far superior to any form of "Roller" Feeder manufactured. We refer to the following gentlemen who have furnished us with testimonial letters to the above effect, which can be seen at our office, viz.:

N. W. CROCKER, Supt. Bunker Hill Gold Mining Co., Amador City, Cal.
D. C. WICKHAM, Taylor Mine, Greenwood, Cal.
W. G. ROBERTS, Greenwood, El Dorado Co., Cal.
J. R. TREGLOAN, Supt. South Spring Hill Gold Mining Co., Amador City, Cal.

WE ARE MANUFACTURERS OF THE

"CHALLENGE," "STANFORD," "TULLOCK," & "ROLLER" FEEDERS,

And will furnish descriptive Catalogues and quote prices upon application.

ORE CRUSHER

THE RAND DRILL COMPANY, 23 Park Place, New York.

We are now so situated with our new works as to offer to the miners of the Pacific Coast SMALL AIR-COMPRESSING PLANTS at such prices that almost any small mine can afford to put in power drills if they have none in use.

By our NEW AND PATENTED SYSTEMS (by which the duty or performance of drills is not reduced with use) it is no longer necessary

PLANTS IN THIS COUNTRY, and has patterns for all sizes up to 40-inch diameter of cylinder. In respect to capacity IN SPEED OF DRILLING, perhaps it is in order to say that in EVERY AUTHENTIC TEST for speed yet initiated, the RAND DRILLS have, without exception, BEEN VICTORIOUS. This fact, coupled with another important one, that the drills use much LESS AIR and cause LESS REPAIRS, has won for them nearly all of the Eastern mining trade, which has kept their works always busy.

Since the reasons which formerly restrained us from the California market no longer exist, we are now in the field for the business.

SPECIAL ATTENTION is called to the latest designed sectional Compressor just built for the Batopilas mine in Mexico, and to the Compound Engine Compressor built for the Anaconda mine in Montana.

An Improved Small Stamp-Mill.

About a year since we gave a description and illustration of the Double Economic Stamp-mill. In this the high drop of the old stamp is more than compensated by the great weight (1200 pounds each) and the rapidity (300 strokes a minute) with which the stamps in this mill run. There are four shoes on each stamp, so that there are 4800 strokes of the shoes on the dies per minute. The mortar has double discharge and the stamps adjust themselves as the shoes wear.

After considerable experience with this appliance, the manufacturers, Messrs. Tatum & Bowen, 34 and 36 Fremont street, this city, have finally perfected this mill, and an engraving of the improved mill is here given. The principal improvement consists in oscillating the stamps by means of sleeves with universal joint. This allows the stamp the utmost freedom of movement, without any tendency to bind or cramp in the working parts. An automatic ore-feeder goes with each mill, and is seen attached in the engraving. This appliance is designed for the use of miners who do not wish to go to the expense of the large stamp-mill of the ordinary type. It will also answer the requirements of large mines. Numbers of these machines are now in use and others have been ordered. The added improvements greatly increase the usefulness of the mill.

THE DEBRIS CONTROVERSY.—In the Supreme Court this week the George H. Sternes and William H. Lee habeas corpus cases were argued and submitted to be filed on briefs, to be submitted by the petitioner in 15 days and by the people in 10 days thereafter. The petitioner Sternes is a Deputy Sheriff of Yuba county, who arrested certain Chinamen, on warrants issued to him by one of the courts of that county, for violating the law with regard to hydraulic mining, and Lee was a citizen whom Sternes, as Deputy Sheriff, summoned as a part of the posse comitatus to assist him. They were afterward themselves arrested at the instance of the Chinamen and their legal adviser, on a charge of kidnaping, and were committed to jail by a justice of the peace of Nevada Township, Nevada county.

OREGON IRON.—On the 18th inst. the fire was lighted in the new furnace of the Oregon Iron & Steel Co. at Oswego, five miles from Portland. Work was also begun in the company's iron-pipe foundry, and the first joint of the 2000 tons contracted for by this city was

successfully cast. The furnace and works are of the most modern style, and are not surpassed by any in the country. The mine is putting out 15 tons of ore per day. The company contemplates the erection of additional furnaces in the near future, and the construc-

tion of works for making bar iron, and eventually to manufacture steel rails.

The asbestos found near Elsinore, San Diego county, is to be worked up in a factory which is to be built at that town.

Sulphuric Acid Manufacture.

In Mr. Adams' paper, which was mentioned last week, he traces the gradual progress of the manufacture of sulphuric acid for the past 20 years, recording the important changes and submitting only the marked types of apparatus which have come under his notice. It is not necessary to cite the differences in chamber construction, such changes, if any, having been made in the direction of increased length and width, and the coupling together of three or more chambers to form a system, the more perfectly to utilize auxiliary towers. A new era has, however, been inaugurated in the general working of complete acid plants by the introduction, during the period named, of the Gay-Lussac absorbing columns, and the Glover tower, inasmuch as the chemical knowledge to properly adjust and harmonize these adjuncts has brought about savings and improvements in all departments. Nevertheless, only about one-half of our American works have adopted the towers.

Figs. 1 and 2 show a type of furnace used throughout the world in 1867-8, being modified to suit local circumstances or individual ideas. The type illustrates in one of many forms of furnaces only the means of shielding the retorts from the direct blast of heat in coal firing, the methods employed to carry off hot acids

when glasses break, the position of the leaden pipe which receives the vapors resulting from boiling pan acids, etc. Fig. 3 is a modification of the others, also in use largely at the time mentioned. An iron pot is built into and made a part of the furnace proper, holding the glass retort on a sand bed intact from fire or draught. At the lowest part of this pot a small cast-iron pipe (not shown) extended through the furnace walls and carried off any waste acid from broken glasses into reservoirs of stone or lead which were conveniently placed for that service.

The market for commercial acids was limited up to the date mentioned, and was easily supplied by the apparatus shown in the cuts. About that time, however, the oil and fertilizer trades had grown to proportions sufficient to absorb all the surplus stock of acids, and in order to command a steady supply for

their needs they had become manufacturers.

As exemplifying experiments aiming to accomplish results which were being produced by our own works contained, the process illus-

CORRESPONDENCE.

We admit, unadvised, opinions of correspondents.—EDS.

Conditions in the Tulare Basin.

Artesian Flow.

[Written for the Press by STEPHEN BARTON.]

The developments in the Tulare artesian basin all tend to a refutation of the theory that artesian flows have their sources in the drainage of higher ground, and to cause us to inquire into the character of the formation before we undertake to declare as to whether artesian water may not be had on the summit of an island and hundred of miles at sea. I will therefore undertake to present to your readers some of the conditions made manifest by past observations here.

Without being too precise, I will say that high-water mark in Tulare lake is about 202 feet above the sea; that its present level is about 171, and that consequently the lake has lowered about 31 feet, and that at its present level it is somewhere about 22 feet above the San Joaquin, at the mouth of Fresno slough. In 1868, when the lake was somewhere from 26 to 34 feet above its present level, it was outletting an immense stream through the channels just named. For several miles on the line of this outlet there are deep pools of water which are from 5 to 20 feet above the present level of the lake. I instance these facts to show that there is no subterranean drainage of the lake down the valley. Still another fact is that the first successful development of an artesian flow in this valley was within this outlet of Tulare lake, and after the lake had subsided 10 or 15 feet below the point of discharge. But still it was possible that the lake might have a drainage directly toward the sea, beneath the Coast Range.

The next efforts in the way of developing an artesian flow in this basin was to the south and east of the lake, when many flowing wells were obtained at an altitude of 260 feet above the sea. Subsequently Cuthbert Burrell struck a second and very powerful flow in the outlet of the lake, which was something like 40 feet above the present level of that ever-fluctuating body of water.

Recently successful borings have been made near Huron, west of the lake, and near the base of the Coast Range. The altitude of these last borings is not determined, but they are believed to be pretty considerably higher than any flow obtained east of the lake, and leave the inference that artesian water may be had at any point on the shores of Tulare lake 40 feet above its level, and that the flow is not toward the sea.

Evaporation alone must account for the water lost in this inland sea, and we are left to look in some other direction than the drainage of higher ground for the source of artesian supply. We must look then to the chemistry of the water itself for an explanation of the enigma.

If we should find that all artesian water contained sulphureted hydrogen and hydrogen free, as well as in all its other combinations, we might infer that there had been a decomposition of water deep down in the earth, and that the superincumbent fluids were lifted by the expansive force of this disengaged hydrogen gas. We are almost forced to the conclusion that hydrogen escaping from the earth's interior was from the decomposition of water, because its great levity would prevent it from entering the earth as a gas and it has but few known combinations.

I believe a cubic foot of granite is conceded to contain much more oxygen than a cubic foot of water, notwithstanding the water is eight-ninths oxygen, i. e., a cubic foot of granite contains over 90 pounds of oxygen and a cubic foot of water 54. It is plain then that in the metamorphism which converts sedimentary rocks to granite, both heat and hydrogen must escape to make room for this lessening of bulk. May it not be then that the process of granite making is the parent of all artesian flows?

The question is one of interest to the miner as well as the scientist, and deserves a more careful examination than can be given to it by this epistolary correspondence.

The Australian coal miners have not as yet settled their differences with the mine-owners, and now there are rumors of labor troubles among the English and Scotch colliers. The Pacific Coast coal mines are shipping liberally, and are strenuously seeking to increase their output so as to avail themselves of the present market, which leaves them remunerative profit. The very heavy arrivals of last month from Australia are being discharged and yarded, and by the end of this month will all be cared for, and the outlook then is, jobbers will further advance their quotations, as the quantity of Australian and English now en route is becoming very light.

There is again talk among railroad officials of building a bridge across Carquinez straits. The exact location of the bridge is yet undetermined, but the latest idea of the railroad company is said to be to use the high bluff opposite each other at Vallejo Junction. The bluff on one side of the bay is right at North Vallejo, while the other is close to the edge of the bay at Vallejo Junction. They are considered to be high enough to give a bridge a sufficient height to allow any vessel to pass underneath.

Agricultural or Mineral.

Register Hetzel and Receiver Linthicum of the United States Land Office have each forwarded to Washington opinions in a case entitled "Central Pacific Railroad Company, applicant, vs. S. D. Valentine, mineral contestant, and any mineral claimants." The case is one of great importance, and the final decision of the General Land Office will be watched with interest. The two gentlemen arrive at opposite conclusions, as will be seen by the following finding of facts and conclusions of law as given by each, which we take from the *Record-Union*:

The Receiver's Opinion.

Mr. Linthicum's finding of facts is as follows: In 1865 or 1866 the Rising Sun mine was discovered and located in Section 33, and patent was obtained for the same in 1870 without protest from the Central Pacific Railroad Co. Said Rising Sun mine was operated until 1882, and gold of the value of \$2,000,000 was extracted therefrom. In 1882, said mine having ceased to be profitable, work thereon was discontinued and has not been resumed.

The Milford mining claim, now known as the Big Tree mine, was originally located in 1866, subsequently bought by the Rising Sun Co., and work was done on the location by the Rising Sun Co. up to 1880. The ledge was considered a parallel ledge to that of the Rising Sun. The quartz formation and country rock are the same in both mines. Said Milford claim was relocated by Werry and Nichols as the Big Oak Tree in 1883, and has been actively and continuously worked since then. About \$30,000 had been taken out of the mine prior to the destruction of the hoisting works by fire in August, 1887, and recent extensive improvements have been erected thereon.

Lying around and adjoining the Rising Sun mine are four mining claims, to wit: the Big Oak Tree, Little Pine Tree, Werry and Golden Eagle, to each of which quartz, in place-bearing gold, has been discovered of sufficient promise to justify the development of the same. These four locations lie within Lots 1, 2, 3, 4 and 5 of the southeast quarter of Section 33 aforesaid, and embrace a part thereof. The testimony does not show that any of those lots are mineral in character, except within the limits of said four mining claims.

The only land claimed to be non-mineral in character by reason of the exhaustion of the mineral and abandonment, is a portion of the southeast quarter of Section 33; lying between the Rising Sun mine and Bear river. The testimony shows that there was some surface mining in a ravine running down the Rising Sun mine to Bear river, and also in the bed of said river, between the years 1857 and 1862, both of which were abandoned in 1862, and have not been worked since.

His conclusions are as follows:

That the lands embraced in the mining claims known as the "Big Oak Tree," "Little Pine Tree," "Werry" and "Golden Eagle," are all mineral lands.

That all of lots of said section which are not embraced in the said mining claims, and the pretended ground of the Rising Sun mine, are agricultural in character.

That a survey should be ordered to segregate the mineral land embraced in said mining claims from agricultural land, of which the remainder of said lots is comprised.

The Register's Opinion.

Mr. Hetzel's finding of facts is as follows: That the Central Pacific Railroad Company of California actually constructed and had in operation as early as September, 1865, their railroad through the land, and no change in the route has been made since that date.

That by official survey, approved by the Surveyor-General of the United States for the District of California December 26, 1865, the whole of Section 33 of said township became identified as an odd-numbered section, within five miles of said road, as actually located and constructed.

The whole of said Section 33 was, after the said location and construction of said railroad, duly returned by the Surveyor-General as agricultural land, and no part of it was returned or denominated as mineral land.

That at the time of said return of said land by the Surveyor-General and the construction of said road there were no mines in operation upon said lands, nor upon any part of said Section 33, nor was any part of said Section 33 known to be valuable for mineral land.

That the railroad company's rights to the land in question acquired precision on the 26th day of December, 1865, and vested as of date July 1, 1862.

That the first discovery of mineral on said section was in March, 1866, when the tract known as Mineral Lot 37 was located by one Neff as the Rising Sun quartz claim; that the same subsequently went to patent from the Government, and that it was subsequently by its owners deemed exhausted, and has not been worked since 1882.

That after the location of the Rising Sun mine and about April, 1866, another mining claim was located upon Lot 3 of the southeast quarter of said Section 33, being a part of the land in controversy, and was called the Milford claim, but it was not operated as a mine, nor was it proved to be valuable for mineral purposes until after its relocation in 1883, under the name of the Big Oak Tree mine,

by the assignors of the present mineral contestant.

That said Big Oak Tree claim now contains a known mine, and is of more value for mineral than agricultural purposes; that it was not proved to have any value for mineral uses until subsequent to 1883.

That all the other mining locations on the southeast quarter of said Section 33 consist of quartz claims surrounding the Rising Sun mine, none of which have been worked as mines, or proved to contain mineral in quantities sufficient to pay the expense of extraction, and that all of them have been located since the relocation of the Big Oak Tree mine in 1883.

That there are no placer or gravel claims upon any of the tracts in question.

That the land in all of the said tracts is agricultural land, adapted for fruit trees and vines.

His conclusions of law are as follows:

That the title of the Central Pacific Railroad Company, under the Act of Congress, became vested as to all the lands in the southeast quarter of Section 33, as of date, July 1, 1862.

That at the time said title vested none of the lands in the section were within any exceptions from the grant by reason of any status as mining lands.

That the subsequent discovery of minerals in paying quantities on that part of Lot 3 of said southeast quarter occupied by the Big Oak Tree mine does not affect the right of said railroad company or its grantees.

That the Central Pacific Railroad Company is entitled to patent for all the tracts, the subject of this hearing.

Electric Power for Mines.

The managing director of the Consolidated Esmeralda Co. has returned from Aurora, Nev., and has made a report to the chairman and directors in London. Among other things in his report the following recommendation will be read with interest:

I have carefully considered the question of motive-power, and have obtained the necessary information respecting the transmission of power by electricity. As already advised, I secured the water rights of Walker river, and sufficient land for the erection of such machinery as may be required. The plant to secure a transmission of 200 h. p. mechanical would cost about 10,000. This is largely in excess of the power now used. The saving effected by the substitution of electricity would, in less than two years, repay the entire outlay. I would here mention that the use of water as a motive-power to be conveyed to the mill and mines by electricity is of the greatest importance, and the adoption of the same, with adequate milling capacity, will materially affect the future of the company, as tens of thousands of tons of low-grade ore now in sight will be worked at a profit, and the Consolidated Esmeralda will be one of the largest bullion-producing companies. Pending the erection of this plant, our present 20-stamp mill can be used for the reduction of ore of high grade, such as is now being obtained from the Durand mine. In conclusion, I am able to congratulate the shareholders on the improved prospects. The great problem of the Esmeralda district has been solved by the proof that the veins that yielded so many millions on the surface do continue in depth, and while gaining strength maintain their richness. The enormous yield from the surface caused great excitement—the yield in depth will probably be equally great, in which case Esmeralda will regain, and for many years hold, the high position lost in the years 1863 and 1864 through ignorance in mining and the gambling spirit affecting all holders of mining stocks at that time.

A communication from the secretary of the company states that "the use of electricity as a motive-power, and the erection of a larger mill, are questions now being considered by the board, and it is hoped that arrangements will be made for the erection of this machinery under conditions by which the company will be greatly benefited. The bullion returns from the Durand mine since January 1st amounted to \$36,540. The total expenditure during the same period, \$31,462. This amount includes the cost of erection of hoisting works, purchase of new boiler, alterations and additions to the mill, prospecting other mining claims, and a considerable increase of stores. It must also be borne in mind that the main shaft has been sunk over 100 feet additional, which (as per the superintendent's report) has been the means of developing a vein 7 feet wide, 'all milling ore.' At the beginning of the year the vein was 2 to 3 feet wide, with only 8 to 16 inches of milling ore."

IMPORTANT, IF TRUE.—Edward Atkinson's Boston economist, says a New England genius has recently discovered a cheap method of dissolving zinc by combining it with hydrogen and producing a solution called zinc water. This liquid, applied to certain woods—notably white wood—makes it absolutely fire-proof at a low cost. Atkinson regards this discovery as one of the most important of the age—one that will surely revolutionize fire insurance, as well as immensely decrease the loss by fire.

AMONG new life-saving stations to be established is one between the Ocean house and Point San Pedro, south of the entrance of San Francisco bay.

Casa Grande District.

A correspondent of the Phoenix (A. T.) Herald says: Casa Grande is destined in the near future to be a place of much importance, for there is every evidence that the many paying mines to the north and south will soon be in active operation, and it is already the shipping point for all the trade of Pinal and Gila counties, with Globe, Pinal, Silver King and Florence as valuable tributaries. Then, too, the southern country, clear to the Sonora line, is filled with promising mining camps that find their nearest base of supplies at this point.

The Jack Rabbit is a most valuable piece of property, having furnished shipping ore for several years, and showing no signs of giving out. On the contrary, as is the case with all the mineral deposits in this group, it increases in richness as a greater depth is obtained. The developments on this property are an incline on the ledge; a second incline further north on the same ledge, 120 feet in depth; and a 200 foot tunnel from the foot of the south incline. The formation is lime and porphyry, and the pay rock is a heavy spar carrying an average of \$15 gold and \$400 silver to the ton. There is a streak running through the ledge, on the footwall, that is almost pure chloride of silver, or, in miner's parlance, "horn silver," and this runs way up in the thousands; and the footwall itself, which is of porphyry, is flecked to the depth of six inches with large flakes of horn silver. For shipping purposes, however, the ore is sorted down to an average of \$400 per ton, and during the last 18 months over \$75,000 worth of ore has been shipped and worked at El Paso. Mr. John Moran has charge of the mine.

The Boomerang is a ledge of gold-bearing quartz, running through a formation of porphyritic and talcose slate; there are four or five claims on the ledge and among them the Boomerang is at present in the highest state of development. The ledge, which at the surface was less than one foot in diameter, is now, at a depth of 40 feet, three feet in width and pays by shipment \$60 per ton. There is also a shaft of 30 feet, and several other minor workings, all in pay ore.

As is natural, none of these properties have been offered for sale, as they have given their owners a satisfactory income from the grass-roots down. Some of the mine-owners in this district only work their properties when they need money. For instance, they will go to work and "knock out" a carload of ore and obtain return ranging from \$3000 to \$6000 and then quit work until the money is spent, when they go to work again.

Among the other paying mines in the district are the Southern Pacific and the Central Pacific, two claims on the same ledge that have been shipping ore at a large profit for years. They are about one mile south of the Jack Rabbit and are owned by John Reiss and Tomlinson. The Orizaba, one mile west of the same property, is owned by John Kron and has been worked at intervals since 1881, shipping in that time some \$75,000 worth of ore. The Wall Street, a parallel lead with the Jack Rabbit, has been shipping rich pay ore to the Vekol mill, 15 miles across the Santa Rosa valley, with most satisfactory results. A little to the southeast of the district, in another spur of the Slate range, is the Lake Shore copper mine, an immense deposit of high-grade copper ore; and there are nearly 40 other paying mines in the district.

A HAPPY CAMP.—All prospecting miners agree that Hawthorne is the "hoss camp" for men of small means. When a man strikes pay there, he begins taking out money at once, and without the aid of expensive machinery. Devil's Gate (Silver City) is another district that is much the same, and in Junho district the mines are still more like those in the vicinity of Hawthorne. In all parts of the country, outside of the Comstock silver belt, are small veins of gold-bearing quartz that are quite rich. In the early days, miners who found them, neither located nor worked such veins. They said of them contemptuously: "They are nothing but little feeders." They looked about to ascertain if they led to any large vein (mother vein), and if no such vein could be seen that was the end of the search in that spot. Now men are going for these so-called "feeders," and in very many cases they are found to lead to rich pockets and successions of pockets strung together like links of sausage. It is found that the "feeders" are feeders of pockets lying at no great distance below the surface.—*Virginia Enterprise*.

OAKLAND HARBOR.—Bids will be opened on November 13th for contracts on the Oakland harbor improvements, and work is expected to commence by December 1st. On five different pieces of work about 300 men will be employed. Some of this work will be completed in a few months and other parts will be unfinished after the appropriation of \$350,000 shall have been exhausted. It is proposed to complete the jetty, widen and deepen the channel, dig out the basin at Brooklyn and build half the canal to San Leandro bay.

THE Good Hope mining property in Pinacata mining district, San Diego county, has been sold to a company, and active operations will be commenced in properly developing the claims.

The Russell Process.

Its Practical Application and Economic Results.

(Continued from our last.)

d. At Sombierete, Zacatecas, Mexico.—Table XXXV gives the results of the full course of preliminary mill tests made at Sombierete to determine the applicability of the Russell process, the ore being roasted in reverberatory furnaces and leached in charges varying from 325 pounds to 4.5 tons. The first three leaching tests were made on very fine and pure pyrites alone. On account of its fineness, and not containing any gangue, it became matted during the roasting. Hence the mill results by the extra solution fell short of the extra in the assay office by 5.9 per cent. The fourth set of mill tests illustrates the injurious effect, on the results by extra solution, of wetting down the roasted ore while it is red-hot, the mill results by the extra solution falling 4 per cent below the results in the assay office by the extra solution.

TABLE XXXV.

COMPARISON OF THE RUSSELL PROCESS WITH THE OLD OR ORDINARY LEACHING PROCESS AT SOMBIERETE, ZACATECAS, MEXICO (ACID-ROASTED ORE).

Description of charges.	Weight of charge.	Value in ounces silver per ton.	Per cent extra ton by ordinary solution in assay office.	Per cent extra ton by extra solution in assay office.	Per cent extra ton by Russell process in mill.
Finest pyrites from the flint, crushed thro' an 8-screen—3 charges.....	325 lbs. 75.8 73.5 90.9 85.9				
Coarse and fine jig-products, mixed half and half, crushed through an 8-screen—1 charge.....	325 lbs. 65.4 67.4 91.8 90.8				
Coarse jig-products, crushed through an 8-screen—5 charges.....	325 lbs. 33.4 76.7 86.2 86.5				
Normal mixture of jig-products, crushed through an 8-screen—4 charges.....	325 lbs. 44.9 80.6 90.6 91.3				
Normal mixture of jig-products, wet down while red hot—3 charges.....	4½ tons. 35.4 77.5 84.6 80.6				
Normal mixture of jig-products, not wet down while red hot—5 charges.....	4½ tons. 36.5 74.0 89.3 88.0				

At the time of making all the above tests, the mill results by the ordinary solution were averaging very much below the results by the ordinary solution in the assay office, so that the actual differences in the mill results in favor of the Russell process, as compared with the ordinary process, averaged 22.6 per cent of the value of the ore. The difference in actual cleanup in silver was a little greater, as the cleanup from the ordinary process fell a little short, while the cleanup from the Russell process was slightly in excess of that called for by the apparent extraction. Since Mr. Watson has had charge of the Sombierete mill both the mill and the assay-office results have been very much higher.

e. At Cuahuirachic, Chihuahua, Mexico.—Table XXXVI gives the comparison of mill results at Cuahuirachic by the Russell process and the ordinary leaching process, during a period of 9 months. The "mixed" months, referred to in the table, are those in which the extra solution was used on a portion (about one-half) of the charges. During the other months either the extra solution alone or the ordinary process alone was used for the whole month. The comparison between the two processes is in favor of the Russell process, as follows:

By the use of the extra solution the time of leaching is reduced 34.8 per cent; the apparent extraction is increased 6.5 per cent; the expenses per ton are reduced \$1.29; the net mill profits per ton are nearly doubled; the gross mill product per month is more than doubled, and the net mill profits per month are more than trebled. It will be noticed that the ore during the months when the extra solution was used was 4 to 5 ounces higher in value than while the ordinary process was in use. Making corrections accordingly, i. e., reducing the value of the ore to 35.1 ounces, this comparison would be in favor of the Russell process by 50 per cent greater net profits per ton, 86.2 per cent additional gross product per month, and 149 per cent additional net profits per month.

During the nine months referred to a discrepancy nearly always existed between the apparent and its actual extraction, both while using the ordinary and the Russell process. Part of this (3.2 per cent) was due to volatilization and loss by dust in roasting the sulphides. This was remedied by substituting steam-drying for roasting. Another portion (2.8 per cent) was found to be due to incorrect assaying of the sulphides. Another portion was due to incorrect determination of the weight of ore leached. The only means of approximately determining the weight of ore treated was by the cubic-foot system, which consists in calculating the weight of the charge from the weight of one cubic foot of ore from each charge and the number of cubic feet in the charge. Careful experiments showed that this method gave 6 per cent more ore than was actually present in the charge. But this approximate method was better than none. At intervals, careful experiments were made to determine whether any dis-

crepancy really existed between the apparent (i. e., the extraction calculated from the value of the tailings as compared with the value of the ore) and the actual extraction (i. e., the product in silver). In all, six of these tests were made during a period of nine months, the weight of ore used each time, varying from 18 to 94 tons, being carefully determined.

The total amount of ore treated in these special tests was 279.1 tons. The average "actual" extraction (or cleanup) was 87.9 per cent, which is 1.7 per cent above the "apparent" extraction. No. 2 (of the six special tests) shows both an apparent and an actual extraction of over 79 per cent by the ordinary process. * * *

TABLE XXXVI.

THE RUSSELL PROCESS COMPARED WITH THE OLD OR ORDINARY LEACHING PROCESS AT THE CUI MILL, COMPARISON OF "ORDINARY," "MIXED" AND "RUSSELL" PROCESSES, MONTHS FOR NINE MONTHS (SEPT. 12, 1886, TO JUNE 1, 1887).

Process used.	Value of ore in ounces silver per ton.	Average total leaching time, hours.	Per cent apparent extraction in mill (by tailings).	Value of product in ounces per ton.	Total mill expenses per ton, leached.	Total mill product per month.	Net mill profit per ton.	Net mill profit per month.
Ordinary process.	35.1	66	78.3	8.681	\$13.37	\$19.00	7.31	7,336
Mixed process.	36.8	46	82.3	7.985	12.92	27.60	12.42	13,724
Russell process.	33.0	41	84.8	8.201	12.08	42.83	15.11	24,436

On San Antonio ore, or on a mixture of San Antonio and San Bartolo, the extraction by the ordinary process averaged much less than this, the difference in extraction between the ordinary and the Russell process being 15 to 34 per cent of the value of the ore, as shown in Table XXXVIII.

This set of special millruns was made to determine the exact difference caused by the use

TABLE XXXVIII.

SPECIAL MILL-RUNS BY RUSSELL PROCESS ON CHARGES ALREADY TREATED BY THE ORDINARY OR OLD LEACHING PROCESS, AND ON WHICH THE VALUE OF THE TAILINGS COULD NOT BE FURTHER REDUCED BY THAT PROCESS.

Number of charges treated.	51	11	11	19	92
Number of tons treated.	450	97	82	174	803
Value of ore in ounces per ton.	44.0	40.5	42.6	48.8	43.0
Per cent of salt used.	11.2	11.2	12.6	15.6	11.8
Per cent extracted by ordinary process in assay office.	78.3	78.3	82.3	84.8	78.3
Per cent extracted by extra solution in assay office.	89.0	89.0	89.0	89.0	89.0
Mill tailings after ordinary process and before Russell process.	13.4	13.0	15.6	17.4	17.1
Mill tailings after Russell process.	6.5	6.2	7.1	7.7	7.3
Mill per cent after ordinary process and before Russell process.	62.6	63.0	67.1	69.3	69.3
Mill per cent after Russell process.	89.0	89.0	89.0	89.0	89.0
Difference between ordinary and Russell process in mill in ounces per ton.	6.6	6.8	7.8	10.8	9.9
Difference in per cent of value of ore.	15.6	19.2	19.0	34.8	22.4
Amount of silver called for by difference in tailings, Total ounces.	"	"	"	"	"
Silver obtained in furnace-dried sulphides, ounces.	"	"	"	"	"
Silver obtained in roasted sulphides, ounces.	"	"	"	"	"
Per cent discrepancy based on dried sulphides.	"	"	"	"	"
Per cent discrepancy based on roasted sulphides.	"	"	"	"	"

of the Russell process as compared with the ordinary leaching process, both in regard to the value of tailings and in actual product in silver. The ore was mixed—San Antonio and San Bartolo. In order to get the best possible results by the ordinary process, the percentage of salt used in chloridizing was increased, and each charge of ore was leached continuously (some of them for five or six days) by the ordinary process, until for two consecutive days the tailings remained the same and it was evident that no further reduction in the value of the tailings could be accomplished by the use of the ordinary process. The extra solution was then used on the same charges, and reduced the value of the tailings to the extent of 9.8 ounces per ton. The increase in the per-

centage extracted, due to the use of the Russell process, was 22.4 per cent of the value of the ore. The increase in "actual" extraction (product in silver) due to the use of the extra solution exceeds the amount called for by differences in tailings to the extent of 2.2 per cent in dried sulphides and 0.8 per cent in roasted sulphides. The differences caused by the use of the extra solution was 22 to 24 per cent, both in apparent and actual extraction.

f. At Yedras, Sinaloa, Mexico.—Table XXXIX gives the comparison in mill results of the extra solution with the ordinary leaching process for a period of two months at Yedras. This was with an experimental run, the Russell process being used on charges of only one ton each.

TABLE XXXIX.

COMPARISON OF MILL-RESULTS BY RUSSELL PROCESS AND BY THE ORDINARY LEACHING PROCESS IN THE YEDRAS MILL FOR A PERIOD OF TWO MONTHS.

Value in oz. per ton.	By Russell Process.	By Ordinary Leaching Process.
Value in oz. per ton.	60.6	63.5
Per cent by ordinary in assay office.	68.9	70.6
Per cent by extra in assay office.	82.7	83.1
Mill per cent.	64.5	82.6

The difference in mill results is 18.1 per cent, or 11.2 ounces per ton in favor of the Russell process. Table XL gives the comparison between the extra solution and the ordinary leaching process as to mill results, expenses and net profits per ton.

Run No. 1 is the one referred to in Table XXXIX. As no exact record of additional expenses was kept for this run, the expenses are taken the same as in Run 2, in which the record of expense was carefully kept.

The second run gives the comparison of the ordinary process for five months previous to November 1, 1887, with the Russell process

TABLE XL.

COMPARISON OF THE RUSSELL PROCESS WITH THE ORDINARY LEACHING PROCESS OF THE YEDRAS MILL, COMPARATIVE MILL-RESULTS, EXPENSES AND NET PROFITS.

Value of ore, oz. silver per ton.	No. of Mill Run.	1st.	2d.
Ordinary in mill short of ordinary in assay office, oz. per ton.	50.03	55.64	
Ordinary in mill short of extra in assay office, oz. per ton.	2.7	3.7	
Extra in mill above ordinary in assay office, oz. per ton.	11.3	9.0	
Extra in mill short of extra in assay office, oz. per ton.	7.44	5.33	
Gross difference per ton in favor of the Russell process, oz.	0.13	0.17	
Additional cost per ton of Russell process, \$1.65	10.10	8.85	
Net difference per ton in favor of Russell process.	\$8.45	\$7.21	

for the three weeks between November 1st and 23d, the process not having been introduced in the mill until November 1, 1887. Yedras being so remote and inaccessible, the price of chemicals per pound is very high, the average price being 10 cents per pound as compared with 4.75 cents in the mining camps of the United States. The weight of chemicals used per ton is 13 pounds for the ordinary process and 6.1 pounds additional for the Russell process. The average of the run shows the superiority of the extra solution to the extent of \$9.48 gross profit, or \$7.83 net profit per ton.

The following statement shows comparison of the mill extraction by the ordinary process at Yedras for 7 months, June to December inclusive, with that of the Russell process for November and December:

MILL EXTRACTION AT YEDRAS.

Month (1887)	By Old Process.	By Russell Process.
June.....	71.1 per cent.	
July.....	66. " "	
August.....	66. " "	not in use till November.
September.....	73.1 " "	
October.....	63.1 " "	
November.....	63.7 " "	\$1.2 per cent
December.....	67.3 " "	\$2.2 " "

B.—Comparison with Amalgamation.

a. At Lake Valley, New Mexico.—Table XXXIV gives the mill extraction by the Russell process and by amalgamation on roasted ore at the Lake Valley mill, the difference in favor of the Russell process being 12.4 per cent of the value of the ore. The leaching charges are 18 to 20 tons, while the amalgamation charges are 1.5 to 2 tons. The amount of water for amalgamation was about eight times that used in the leaching. The difference in expenses could not be ascertained, as the amalgamation was at the rate of only 3 or 4 tons per day. Probably the difference in expenses would not have been less than \$5 per ton in favor of the Russell process.

b. At the Ontario in 1883 and 1884.—Table XLI illustrates the comparison in mill results between the Russell process and amalgamation on Ontario-roasted ore during Mr. Russell's experiments at that mill. The amalgamation tests were necessarily confined to ore crushed through a 30 mesh screen and roasted with 16 to 18 per cent of salt. But the leaching tests were made on ore crushed as coarse as a 16 mesh and with all percentages of salt, from 18 down to 0. The table shows that the results of leaching on ore roasted without any salt were only 4 per cent less than the results by amalgamation on ore roasted with 18 per cent of salt. Also, that ore crushed through a 20-mesh screen and roasted with 12.5 per cent of salt, the extraction by leaching was 4.5 per cent greater than by amalgamation with finer crushing and 3.5 per cent more salt. The average results by leaching on ore crushed through

a 16 mesh screen with 12 per cent of salt, were also higher than those by amalgamation on ore crushed through a 30-mesh screen and roasted with 17.5 per cent of salt. The amount of water required for amalgamation was 2.3 times as great as that used in leaching. The milling

TABLE XLI.

THE RUSSELL PROCESS COMPARED WITH AMALGAMATION. RESULTS ON THE LARGE SCALE AT THE ONTARIO MILL, PARK CITY, UTAH, 1883 AND 1884.

Process Used.	Per Cent. of Salt.	Size of Screen.	Weight of Charges, Tons.	Per Cent. Extract'd.
Russell Process.....	0	30	2	84.0
Amalgamation.....	18.2	30	1½	80.4
Russell Process.....	0	30	2	85.7
Amalgamation.....	18.2	30	1½	80.3
Russell Process.....	0	30	2	91.2
Amalgamation.....	15.9	30	1½	92.5
Russell Process.....	12.5	20	2	91.0
Amalgamation.....	15.9	30	1½	92.5
Russell Process.....	8	16	2	92.0
Amalgamation.....	17.9	30	1½	96.1
Russell Process.....	12	16	2	97.1
Amalgamation.....	17.3	30	1½	92.5
Russell Process.....	16	16	2	95.7
Amalgamation.....	17.5	30	1½	95.5
Russell Process.....	18	16	2	95.1
Amalgamation.....	17.5	30	1½	93.3

expenses by amalgamation for the year during which these experiments were made averaged about \$15 per ton. On the other hand, as shown by the expenses for a similar ore in the United States, deducted from the cost expenses, the corresponding cost in a mill using the Russell process would probably be at least \$5 per ton less.

(To be Continued.)

The Mines of Sparta.

The Bedrock (Oregon) Democrat says:

The town of Sparta, situated in the southeastern portion of Union county, Oregon, and about 30 miles northeast of Baker City, is the center of a mineral belt extending for miles in either direction, and mines, both quartz and placer, are being worked with most gratifying results. The first discovery of this camp was brought about in the year 1865, when rich deposits of gravel were found in numerous gulches, which afforded the lucky finders grand returns with the rooker and pan. Many thousands of dollars were taken out by this crude method of working, but it was not until the year 1871 that they attracted wide-spread attention. At this time the gigantic enterprise of building the Eagle creek canal was completed, and an abundance of water was brought into the camp from the head of Eagle creek and turned into the heads of the various gulches, affording the miners the opportunity to equip their claims with hydraulics, etc., which they were not slow in taking advantage of, and for years, and up to the present time, thousands upon thousands of dollars of the precious metal have been the annual output. Probably no camp in the Northwest proved richer than Sparta, and from present indications the camp will turn out a creditable production for years to come. Within the past few years the attention of mining men has been drawn toward the rich quartz deposits of this camp, and it goes without saying that there are few, if any, richer gold quartz districts in the Northwest.

The principal group of mines of Sparta are the Del Monte, and with proper facilities for hauling the immense quantities of ore this property is capable of producing, the profits would be surprisingly large. This property is developed by 800 feet of tunnels and 150 feet of shafts. The ledges are well defined, varying in thickness from six inches to six feet. One thousand tons of ore are on the dump and upward of 10,000 tons in sight. The average ore value in gold is \$22.73 per ton. The lowest assay ever made was \$5.12 and the highest \$94.13 in gold to the ton. The ore is classed as concentrating and is the iron sulphur.

The Mary Ainsworth group, consisting of the Mary Ainsworth, Hidden Treasure and Pacific Chief, situated two miles from Sparta, is attracting the attention of capital, and we are informed that work of a substantial nature will be again commenced under the supervision of Lewis & Co., the well-known mining engineers and contractors of Sparta.

The Free Thinker of Sparta is showing up some of the richest free gold quartz we ever saw.

An enterprise that will prove of great importance to the whole of this section is the organization of the Eagle Creek Mining Co. of Chicago, which will put into successful operation one of the richest bodies of placer mines on the coast.

Sparta, with its vast extent of mineral resources, is destined to create a furor in the mining world, and that, too, at no distant day.

A SMALL army of laborers, stone-cutters and carpenters are at work on the buildings of the Stanford University, and it is likely that a portion of the structures will be ready for occupancy in less than six months. The six buildings forming the rear half of the quadrangle are roofed in and the interior work is going on. The six on the front are making good progress. The buildings are all one story high, with walls of yellow sandstone and roofs of red tiles.

THE report from the United States Assay office at Boise City shows the gold, silver and lead production of Idaho for the year to have been \$8,905,136, of which gold was \$2,522,209, silver, \$3,422,657, and lead, \$2,960,270.

SAN FRANCISCO

Saturday Morning, Oct. 27, 1888.

TABLE OF CONTENTS.

EDITORIALS.—An Improved Small Stamp Mill; Sulphuric Acid Manufacture, 273. Passing Events; The Copper Trust; California's Mineral Products; San Francisco and Eastern Castings; The Mining Debris Commission; Discharger for Concentrator Belts, 276. The Duke Square Patent Engine, 277.

ILLUSTRATIONS.—The Perfection "Double Economic" Stamp Mill; Apparatus for the Manufacture of Sulphuric Acid, 273. The Duke Double Reciprocating Piston Engine; Continuous Sulphuric Acid Process of 1880; Continuous Process with Porcelain Dishes, 277.

CORRESPONDENCE.—Conditions in the Tulare Basin, 274.

MISCELLANEOUS.—Agricultural or Mineral; Electric Power for Mines; Casa Grande District, 274. The Russell Process; The Mines of Sparta, 275.

MECHANICAL PROGRESS.—Rolling Seamless Tubes or Pipes; A New Husking Machine; Uses and Preservative Qualities of Soapstone; The Weldless Rolled Chain; A Monster Locomotive; Motors vs. Compressed Air; An Electric Crane, 278.

SCIENTIFIC PROGRESS.—What Evolution is Not; The Aurora Borealis; Larger than the Lick Telescope; An Ancient Manuscript to be Reproduced; North Carolina's Underground River; Effects of Soap in Geysers; The Retrocession of Niagara Falls; Standard Time; Submarine Telephony, 278.

USEFUL INFORMATION.—Make Your Own Ice Cream; Artificial Silk; Paper Mache Covering for Pulleys; How Glass Lamps Chimneys were Invented; To Polish Tinware; Sharpening Tools; Hebrew Manufacturers; For Removing Old Varnish; A New Steam Street Car, 279.

GOOD HEALTH.—Yellow Fever; Tough Fruit Skins; Ears Injured by Sea Bathing; The Best Way to Obtain Rest; An Interesting Question; Another Alleged Cure for Whooping Cough; For the Feet, 279.

ENGINEERING NOTES.—The Rival Canals; The Hudson River Tunnel, 279.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 280-81.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 284.

Business Announcements.

Risdon Iron and Locomotive Works.
Assistant Superintendent Wanted—Pacific.
See Advertising Columns.

Passing Events.

The telegraph announces the appointment of the Commission of engineers to examine into the debris question in this State. In a very short time, probably, they will prepare to commence this important work.

A large force of men are at work at the soda works at Keeler. A large refinery is finished and machinery is being put in. The manufacture of soda from Owens lake water has now passed beyond the experimental stage and is a permanent industry. The soda can be made in unlimited quantity.

The action of the French copper syndicate, referred to in another column, is very important to the owners of copper properties. If the price of the metal is forced still higher, there will be a chance for profit in working the mines of California and Nevada.

Tin ore has been found in the Ioyo mountains, not far from Independence Station. The percentage of metal is low, but the ledge is large. The samples assayed are from the surface, and better ore may be found with depth.

Lead miners deplore the Chicago failure since lead broke in value as a consequence. Some of the Utah papers fear the price will not "rally" for some time.

The Copper Trust.

The French metal syndicate or trust, which now controls the copper supply of the world, has been so successful in advancing prices that it intends perpetuating itself for a longer period than was at first intended. Most of the original contracts with mining companies were for three years. The new contracts are to extend over a period of 10 to 12 years. In consequence of the great increase of stocks, negotiations have been for some time pending between the syndicate and the larger producers of copper for a reduction of their output to the extent of 25 per cent, the loss to the mining companies being compensated for by an increase in their contract price. The telegraph informs us preliminary negotiations to this effect have been concluded at Paris. Last month the Bank of England advanced their rate of discount from three to four per cent, and the Bank of France at once followed with an advance to 3½. A further advance in the Bank of England rate is expected. This will considerably increase the cost of holding the present large stocks of copper, now estimated to amount in public and private stores and at smelters' works in England and France to over 105,000 tons, and in the United States to about 10,000 tons.

This represents an outlay of fully \$40,000,000, which will give a pretty good idea in itself of the magnitude of the great French syndicate's operations. For its own protection it must now restrict production. But controlling all the world's copper and the producing mines, it can, of course, increase the price still further and greatly reduce the production. This proposed and necessary reduction of product and increase of prices will permit the mining companies to make as much profit, but it will not be to the advantage of the working miners. It means a reduction of force in mine and works.

Naturally since copper has advanced in price so largely, consumption has fallen off, as the substance is dispensed with as far as possible in the arts. There is a certain amount, however, that must be used, and the people who use it will have to pay well for the privilege.

As far as the mines of this country are concerned they have been benefited by the operations of the Frenchmen. They get a better price for their product and have no trouble in disposing of it. It is the consumer who is "out and injured." Many mines which have not been worked for years are now in operation and more are being opened. It will be seen that from all appearances the price of copper is more likely to advance than to recede.

California's Mineral Products.

California is best known, of course, for its product of gold, and for many years the only mining work done was in the direction of developing deposits of this metal. It still leads all other regions of the United States, or the world, in annual gold production, but many other mineral products are now worked. The borax mines are the largest in the United States, and there is still much ground undeveloped. The chrome mines of California are the only ones in the United States, and the quick-silver product of America is all from this State. We have copper ore in plenty, but few of the mines are being worked. There is plenty of building-stone, gypsum, infusorial earth, iron, cement, kaolin, ochre, lead, silver, sulphur and other mineral products.

The coal mines of the State yield about 12,000 tons a year. The salt production is very large. There is manganese also, but none is being worked at present. The same may be said of the sulphur.

Among those things to which great attention is now being paid are petroleum, coal and natural gas, and developments with these are increasing. Attention is again being paid also to tin. Asphaltum and bituminous rock are also being more utilized than ever before. Lime is made in nearly every county of the State, and there are numerous beds of clay for pottery and brick manufacture. Refineries for soda works are also being erected.

All these varied mineral products will in the future attract more attention than in the past. Many of them will necessitate the establishment of manufactories, and hitherto capital has hesitated to embark in such enterprises. A change is manifest, however, as the industrial development of the State advances.

No State in the Union has more varied min-

eral resources than California. But we have paid so much attention to gold that the other minerals and metals have been neglected. Within the past few years we have begun to realize this, and from this on all the miscellaneous mineral industries will be better developed.

San Francisco and Eastern Castings.

We had a conversation this week with Mr. A. B. Bowers, formerly of this city, but now of Washington, D. C., who is on a business visit to San Francisco. He will leave in a few days for San Diego, where one of the Bowers dredgers will commence work on a million-yard contract in the harbor. The work is to be done for the Coronado Beach Co. Glorieta bay—a high in the main bay—is to be dredged out so as to form a yacht harbor, and the material is to be deposited ashore. The little bay is now bare at low tide, but when the work is completed there will be 7 feet of water. It is on the south side of Coronado beach and close to the large hotel.

The iron-work for the new dredge was made in Chicago, as the principal stockholders in the dredging company are residents of that place. Mr. Bowers says, however, he cannot get any such castings in Chicago as are made in San Francisco. They are coarse and rough, and many have to be rejected. Those that were accepted would not have been taken from the foundrymen here.

The Chicago men do not use good sand for their castings. They take contracts at a lower figure than is done here, but their iron only costs them 1½ cents per pound. By not ramming the sand the casting weighs about one-third too much, and in the end the cost of the work comes up to about as much as it does here. The shop-work on the dredge was, however, done well. Mr. Pierce of San Francisco went on to superintend the work and would accept none that was not first class. They soon found out that if it was not perfect Mr. Pierce would not accept it, and grumbled somewhat as to his being so much more particular than others were. He told them, however, that what they were doing might be all right for usual customers, but it was not for San Francisco people who were used to getting good machine-shop work, and would not be put off with anything second class. The new dredge referred to cost about \$50,000 and is built under the Bowers patents.

A BELT RAILROAD AROUND THE CITY FRONT.

At a meeting of the Board of Harbor Commissioners, W. H. H. Hart spoke upon the proposition of building a belt railroad around the water front. He said he represented the Bay City and Harbor Navigation Company, which was willing to expend \$2,500,000 in the enterprise. The only return asked by the company was the privilege of charging a nominal rental to the railroads making use of the track, all companies to be allowed equal facilities.

THE LICK TRUSTEES are discussing a method of legally paying a portion of the surplus money on hand to the residuary legatees—the California Pioneers and Academy of Sciences. When authority can be had by order of court, some of the money will be paid over.

A GREAT DEAL of the Anaconda matte is now being stored at the smelting works in Montana, while Boston-Montana matte, Arizona and other slag or ingot copper is being stored in New York.

RICH placers are said to have been discovered 25 miles southwest of Nogales. Some of the nuggets found are large. One worth \$200 was brought to San Francisco this week.

THE average pay on Forty Mile creek, Alaska, this year, has been from \$8 to \$10 per day, although some claims paid higher. Wages paid to placer miners were \$8 per day.

THE Paris Temps says that the preliminaries of the new agreement between the copper syndicate and the mining companies have been signed.

CONTRACTS have been let at Tacoma for building new coal-hunkers, which will load nine ships at once. The work must be done in one year.

A COMPANY in London is now manufacturing the Huntington roller-mill. Some of these machines are now working ore in Africa.

The Mining-Debris Commission.

In accordance with the Act of Congress recently passed and approved, the Secretary of War has detailed Major Benyard, Major Heuer and Major Hanbury as a Commission to investigate the mining debris question in this State. The first two mentioned are now stationed at San Francisco, and the latter is at Portland, Oregon. All these gentlemen are officers of the engineer corps of the United States Army. Major Hanbury was formerly a resident of this State, but has been for some years stationed at West Point.

From the nature of their profession, these gentlemen are highly skilled engineers. Those graduates of West Point who show the highest efficiency are usually destined for the engineer corps. The Engineer Department of the army is, as a result, composed of officers of special attainments.

The appointment of this Commission is a most important step in the conclusive settlement of the much-discussed mining-debris controversy. We have now three disinterested experts in engineering matters, who will study up the whole matter and give the people an unbiased report. Their positions are not dependent on political favor of any kind, and they have nothing to lose or gain one way or another.

We may therefore confidently expect an intelligent report that will deal with the subject from an engineering—and therefore practical—point of view. Naturally the principal feature for the Commission to study will be the navigability of the rivers of the State, and how they are affected by debris. If the rivers can be saved, the land can. Then it will be their duty to point out the proper means to be taken to prevent further damage. If they think the mines can be worked without detriment to other interests, they must show how to dispose of the debris. If they can see no way to accomplish this, they must conclude that hydraulic mining must be stopped forever. But if a way out of the difficulty can be seen, the details of the plans will be given us. It is a matter for congratulation to the people of the districts affected that this Commission has been appointed.

Discharger for Concentrator Belts.

George W. Starr and R. M. Kinley of Grass Valley have just obtained a patent through the MINING AND SCIENTIFIC PRESS Patent Agency on an improvement on endless belt concentrators, like the Frue and Triumph. The object of the improvement is to discharge the sulphurets before the belt reaches the usual washing-tank. The objection to the usual method of letting them pass into the acid tank is, that owing to the agitation in the tank caused by the passage of the belt and its shaking supplementary movement, and by the use of the hoe employed in drawing the sulphurets out, a loss of fine sulphurets is sustained, the finer particles floating away, in spite of all efforts to save them. This is what these inventors claim to be the case, and they also claim that by the use of their discharger, all the sulphurets, both coarse and fine, are precipitated into the receiving-hox, where they will not be disturbed, and in which they can be handled without loss or conducted in distributing pipes to the dry-room, where a large reception-tank may be built, thus saving the labor of one man.

The discharger consists of a rubber strip secured along the top edge of a body piece, the upper end of which is provided with a curved seat on which the rubber strip is secured, so that it is given a curve or cross section to conform to the curve in the belt. The strip is so placed as to be adjustable laterally, and the contact may be accurately adjusted.

Instead of the sulphurets being washed off the belt in a tank of water, they are discharged from the belt by the contact of the rubber strip therewith, with the assistance of a stream of water, so that, instead of passing round with the belt into the underlying tank, they fall into a receiving-hox and may be handled readily. The inventors are aware that rotating scrapers or brushes have been used to scrape off sulphurets from a traveling belt, but claim this particular discharger, curved to conform to the direction of the belt, and made of rubber for rubber belts.

JAMES G. FAIR has been inspecting some mining properties at Colfax.

Sulphuric Acid Manufacture.

(Continued from page 275)

trated in Fig. 4 may be cited. Pan acid is run continuously into the upper glass, and thence through the series by means of siphons of annealed glass tubing bent to proper shape. The legs of the siphon are inserted in glass cups (not shown) or bent upward, the better to retain their charge of acid. Differences in gravity between the acid in the upper glass (62° B.) and the lower glass (66° B.), and diminution in bulk by distillation, are equalized by setting the glasses in steps; but so changeable are the conditions when firing with coal that ordinary sized retorts (15 to 20 gallons capacity) are found too uncertain in daily use; and this process was only maintained continuously when five-gallon pear-shaped retorts were employed. While never applicable for extensive service, yet the process can be made useful for several purposes if fired with gas.

Fig. 5 shows a continuous process, originating in Brooklyn, N. Y., which the writer (Mr. Adams) put into use to replace the one last spoken of. It was in very general use from the year 1869, and can yet be found in

through which lip the partially concentrated acid runs to retort No. 2, and thence to Nos. 3 and 4 of the series, a loosely attached glass tube forming the connection from spout to funnel, variable heats, the shocks of the boiling and the action of the sediments. Although this and several ingenious devices of more or less merit have been brought to notice, none of them have

THE DAKE DOUBLE RECIPROCATING SQUARE PISTON ENGINE.

The completed product (65° to 65.5° B.) is cooled in leaden pipes or troughs, set in running water, and from such coolers is taken to suitable storage tanks. The retorts are set in

been commercially successful or deserve particular notice.

THE NORWAY STEEL & IRON CO. OF BOSTON HAS

Fig. 6.

FIG. 6.—CONTINUOUS PROCESS WITH PORCELAIN DISHES.

several of the smaller works. By this process the pan acid (60° B.) runs continuously into the first glass or retort through a funnel which is inserted in an opening in the upper part of the glass. Opposite and below this opening for the weaker acid, a lip or spout is attached to and made, by blow-pipe work, a part of the retort,

cast-iron sangers on a bed of clean dry sand, free from all organic matters.

Fig. 6 shows a process aimed to accomplish like results with the previous examples, porcelain dishes and connection pipes taking the place of glass, and the porcelain, carefully annealed, being depended upon to withstand the

decided to go out of business. Fully 500 men will be thrown out of work. The concern is well known throughout the country, because of extensive dealing in Swedish iron.

ABOUT 50 miners are wintering on Forty-Mile creek, Alaska.

The Dake Square-Piston Engine.

The Dake reciprocating square-piston engine is not a mere novelty, but a reliable motor. It is a double engine with the two pistons in one case and acting as valves for each other. The outer piston moves horizontally backward and forward, and the inner piston reciprocates vertically within the outer one, and these, together with the crank and shaft, comprise all of the moving and wearing parts of the engine. The eccentric valve, valve-rod, piston-rod, cross-head slides and connecting rod, are entirely dispensed with. The engine is automatically lubricated through the steam, the oil getting to every part thoroughly. The engine has no dead centers, the steam acting on the piston at the periphery of the crank, where it has the greatest amount of power, and taking steam alternately on each piston after passing the center.

As will be seen by the accompanying engraving, all the working parts are inclosed. No skilled engineer is needed, the main attention required being to know that the oilers are provided with oil and to occasionally blow off the water of condensation. The engine weighs little and occupies small space. No link or eccentric is used for reversing. It can be reversed instantly at any point of stroke by simply reversing the lever attached to the throttle. It offers many advantages as regards compactness, positive action, speed and durability, and is well adapted for running dynamoes, pumps, blowers, hoists, capstans, steam yachts, and is especially adapted for use in saw and shingle mills, etc., where additional power is needed, without requiring any radical changes or large expense. The agents on this coast are the Stearns Manufacturing Co., 29 and 31 Spear St., San Francisco.

THE returned Yukon (Alaska) miners have all come to the conclusion that, taking into consideration the time consumed in getting in and out of the country, the high price of provisions, and the hardships endured, nothing less than \$15-diggings will pay them for the trip. However, they are free to say that as soon as a road has been built over the portage and steamboats put on the river, the Yukon will be a great country.

THE University of Southern California talks of a 42-inch telescope, but it is more probable that if Clark makes one of that size it will go to the Leland Stanford, Jr., University. A glass of that size could now be made much cheaper than that of the Lick telescope, which is 36 inches.

REPORTS from the Quijotas state that the Peerless mill is working steadily away on old ore which was in the bins, and is making good progress. There is about 150 tons of this ore, which is of a lower grade than that found in the recent development.

THE Paso Robles *Moon* says that the Slack's Canyon coal mines are likely to be abandoned, the developments not warranting the building of a railroad to the mines, and the working force having already been reduced from 30 men to nine.

THE President having approved the Act allowing vessels not carrying passengers to burn petroleum as fuel, the Treasury Department at once issued blank permits to Collectors of Customs for this purpose.

THE Lake Superior Copper mines—10 of the principal ones—for the first eight months of this year, have produced 27,324 tons of fine copper, as compared with 25,140 tons during the same period last year.

THE annual report of the Tamarack Mining Co. of Lake Superior states that the mine produced 5195 tons of fine copper during the past year, at a cost of 53 cents per pound laid down in New York.

THE Bonanza quicksilver mine, near Oakland, Oregon, is producing 15 flasks a month. A new 40-ton furnace is being put up.

SEVERAL prospectors have been killed by the Navajos while searching for the mythical, long-lost Adams mine, N. M.

MECHANICAL PROGRESS.

Rolling Seamless Tubes or Pipes.

Fresh attention has recently been called to the merits of Mannesman's Tube Rolling Process, by which tubes or pipes for water or gas are made directly from an ingot with a small hole through it longitudinally. Mr. Siemens is an enthusiastic champion of the process and has given what he regards as strong reasons for dispelling the incredulity and prejudice which has grown up in regard to the process. The English correspondent of the *American Manufacturer* writes as follows in regard to the matter:

Contrary to many of his contemporaries, Mr. Siemens believes that the process is based on true principles, and that in the Mannesman system manufacturers have to their hand "a method of rolling as new as it is capable of producing effects hitherto not contemplated." Mr. Siemens claims for it that in combining in itself many of the various systems of rolling previously invented, the system may be called the universal system of rolling, in which hitherto all known processes represent a part.

What a Mannesman Process Accomplishes.

Under the Mannesman system, from a rough ingot of steel, either Bessemer, Siemens or basic, with one or two operations, a perfect seam, and with a circular fiber, is produced. Tubes of great length and diameter, and almost of any desired thickness of metal, can be produced at a comparatively low cost, air-tight, and possessing treble or quadruple the resisting power of the best welded tubes of wrought iron.

The New Invention Described.

In describing the new invention, Mr. Siemens remarks that a bar or rod which is passed through the Mannesman rolls will, provided its substance is sufficiently homogeneous and plastic, undergo a violent twisting and stretching action, the fiber being spun as is the fiber with a rope, on account of which the process may appropriately be called a torsional process. The bar in its passage through the mills is twisted in a spinning machine. As, however, it cannot be fed from the outside, as is the thread, and as the diameter cannot be reduced on account of the action of the rolls, it is forced to draw on the interior for a supply of material.

How the Tube Is Manufactured.

The tube is made as follows: A bar is placed between the conoidal rolls at the part where the diameter being least, the speed at which they move to make the revolution is also least. The rolls seize the bar and draw it into contact with parts of the cones, which move more and more rapidly through, owing to the way in which the rolls are set, the space left between them for the passage of the bar decreasing slightly. Slight, however, as is this decrease in the space between the rolls, a certain amount of material has to be shifted. The action of the rolls prevents this material from being taken from the outside of the bar, and, consequently, it is drawn from the interior—hence the hollow, hence the tube.

The Peculiarity of the Mannesman Process.

Soon after entering the rolls a small central fracture is formed, which widens out to a hollow space as the increased stretch is made to take effect on an increased twist acted on from the surface. The increasing twist of the fiber of the bar while passing through the rolls, and the peculiar relation kept up between longitudinal and turning action, is the characteristic of the machine.

Employment of the Mandril in Tube Rolling.

The mandril is generally used to finish and smooth the interior of the top and to enlarge it, but Mr. Siemens explains that it is an erroneous idea that this mandril is necessary to form the hole in the bar. Such an operation is impossible. No machine could stand the strain if it were to attempt to force the mandril longitudinally through a solid bar of hot steel. Specimens of partially finished tubes were placed before the British Association in proof that the hole within the bar was formed without the intervention of the mandril, Mr. Siemens observing that such

Specimens Quite Disposed of the Allegation That the hole was made by the mandril. Tubes manufactured upon this process possess great toughness and resisting power, and their qualities, Mr. Siemens contends, upset the hitherto accepted ideas in shaping metals, inasmuch as it is proved that, instead of avoiding any great twist of the fibers, the imparting to the material of the greatest possible twist with a corresponding stretch by one operation may give it qualities which it would be otherwise impossible to supply. We are likely to hear more of this process in actual manufacture in the future.

A NEW HUSKING MACHINE.—A simple device by means of which the husk of corn can be easily and quickly torn from the ear has been patented by Theodore H. Mehning of Niohara, Neb. The device has jaws which open and close like shear blades, each of the jaws having concave sides, which, when closed, form a cup-like cavity, the meeting edges being cut away at the middle to form an aperture when the jaws are closed. Each jaw has a row of short inwardly projecting teeth around the edge, with a pointed prong on the outer end to guide the ears of corn into the space between the jaws.

The jaws are not in the same plane with the handles, but at a considerable angle thereto, and the large side of the handle has a sharp-edged tooth to be used to cut the silky threads on the ears. The operator holds the husker with his right hand, with his left taking an ear of corn by the outer end, when he opens the jaws and passes the pointed ends over the stem of the ear until the inner end of the husk is inclosed by the jaws, so that the stem of the ear projects through the aperture. The jaws are then closed so that the teeth penetrate the husk, when, with a slight twist, the ear is freed from the husk by breaking the stem.

USES AND PRESERVATIVE QUALITIES OF SOAPSTONE.—Frank C. Goo, all, surveyor of shipping to the Trinity house, Richmond, London, writes to *Iron* as follows: I have for some time experimented with a material called Chinese soapstone as a substitute for the ordinary metallic pigments used in paints, and I have found this soapstone to possess qualities highly calculated to prove an effectual remedy against the danger of rust. In China, soapstone is largely used for preserving structures built of sandstone and other stones which are liable to crumble under atmospheric influences, and the covering of powdered soapstone in the form of paint on some obelisks in China, which were hewn out of stone liable to suffer under atmospheric influences, has been known to preserve the same intact for hundreds of years. Soapstone may, therefore, be said to have extraordinary qualities in withstanding atmospheric influences which have a great deal to do with the corrosion of steel and iron, for it is well known that the inside of a steamer, which is not exposed to the incessant action of salt water, like the bottom, corrodes very much more quickly than the outside. Soapstone has, however, another quality which eminently adapts it as a protective paint on ships, and that is the extreme fineness of its grain. Ground soapstone is one of the finest materials which can be produced, and from the experiments which I have made, I have found nothing to take hold of the fiber of iron and steel so easily and firmly as soapstone. It is, moreover, lighter than metallic pigments, and if mixed as a paint, would cover a larger surface than zinc white, red lead or oxide of iron.

THE WELDLESS ROLLED CHAIN.—The idea of rolling or squeezing chains out of a solid bar of iron or steel is not altogether new. Various mechanisms to perform such work have been devised in the recent past, but it is claimed that the recent invention of Mr. M. J. Jacker of the Bullock Manufacturing Co. of Chicago is the only one thus far which has proven itself to be practical. The bar from which the chain is rolled, or rather squeezed, is so rolled that a cross-section assumes the shape of a four-rayed star, two opposite points of which are smaller than the other two points. The bar is forced through four converging dies. In producing a continuous chain in this way the dies are made continuous by placing them on the circumference of form rollers in equal divisions. The rollers are driven by gear-wheels, so arranged that the four parts of a link will meet accurately in place. Proper clearance is given to the dies to allow the links to leave the matrices free as the roller revolves. As the material is carried forward between the rollers the dies partially press or wedge out the links at right angles to each other, breaking the fine or feather edge that is left on the inside of the link, thus producing a finished chain. The machinery having been proven to be practical, the inventor is now engaged in forming a company to put up extensive works for this class of manufacture.

A MONSTER LOCOMOTIVE is now being constructed for the Atchison & Topeka railroad, which it is estimated will make 80 miles an hour. It was designed by G. S. Storey of New York and carries two cabs, one over the center of the boiler for the engineer and the other in the old style for the fireman. It is the largest passenger locomotive ever built. All the wheels are of paper, with steel tires, and the driving-wheels are the largest ever made. The Worthington steam pump works that a great part of the exhausted steam is pumped back and serves to heat the water in the tank. Another economy in fuel is the work of the large combustion chamber, which burns up all the gas. It is expected that the engine will make 80 miles an hour with ten passenger cars on an ordinary road.

MOTORS VS. COMPRESSED AIR.—Mr. George Cutter, the electrical engineer of Chicago who has recently been making a trip through the mining regions, was impressed with the fact that if the electric motor were used in the mines in place of the compressed air system, it would do away with many of the delays now caused by the use of the latter. Not only the great adaptability of the motor to such work, but its superior safety and economy, will hasten the change proposed.

AN ELECTRIC CRANE.—One of the traveling cranes at the Erith Iron Works, England, which was originally constructed to work by hand, has recently been operated by a dynamo with very satisfactory results. A single attendant now works the machine. Electric power has since been applied to several other cranes, which are giving good satisfaction. Provision is made for varying the power and speed to suit the requirements of the work in hand.

SCIENTIFIC PROGRESS.

What Evolution is Not.

Everybody nowadays talks about evolution. Like electricity, the cholera germ, woman's rights, the great mining boom and the Eastern question, it is "in the air." It pervades society everywhere with its subtle essence; it infects small talk with its familiar catchwords and its slang phrases; it even permeates that last stronghold of rampant Philistinism, the third leader in the penny papers. Everybody believes he knows all about it, and discusses it as glibly in his every-day conversation as he discusses the points of race-horses he has never seen, the charms of peeresses he has never spoken to, and the demerits of authors he has never read. Everybody is aware, in a dim and nebulous semi-conscious fashion, that it was all invented by the late Mr. Darwin, and reduced to a system by Mr. Herbert Spencer, don't you know, and a lot more of those scientific fellows. It is generally understood in the best informed circles that evolutionism consists for the most part in a belief about Nature at large, essentially similar to that applied by Topsy to her own origin and early history. It is conceived, in short, that most things "grew." Especially it is known that, in the opinion of the evolutionists as a body, we are all of us ultimately descended from men with tails, who were the final off-spring and improved edition of the common gorilla. That, very briefly put, is the popular conception of the various points in the great modern evolutionary program.

It is scarcely necessary to inform the intelligent reader, who, of course, differs fundamentally from that inferior class of human beings known to all of us in our own minds as "other people," that almost every point in the catalogue thus briefly enumerated is a popular fallacy of the wildest description. Mr. Darwin did not invent evolution any more than George Stephenson invented the steam engine or Mr. Edison the electric telegraph. We are not descended from men with tails any more than we are descended from Indian elephants. There is no evidence that we have anything in particular more than the remotest fiftieth cousinship with our poor relation the West African gorilla. Science is not in search of a "missing link;" few links are anywhere missing, and those are for the most part wholly unimportant ones. If we found the imaginary link in question, he would not be a monkey, nor yet in any way a tailed man. And so forth generally through the whole list of popular heliots and current fallacies as to the real meaning of evolutionary teaching. Whatever people think evolutionary is for the most part a pure parody of the evolutionist's opinion.—From "Evolution," in *Popular Science Monthly*.

The Aurora Borealis.

Still another German astronomer propounds an explanation of the aurora and zodiacal light. According to this theory, the sun's rays, falling on the earth, are variously reflected as they fall vertically or at an angle more or less obtuse, and the earth being conceived as a large mirror, many of the obliquely incident rays will be reflected to a part of the celestial vault on the right side of the earth. The zodiacal light he ascribes to the irregular reflection of the sunlight from water, and similarly the vast fields of ice in the polar regions, he considers, may be regarded as an imperfect mirror, irregularly reflecting the incident light. The rays which fall most obliquely are the most abundantly reflected, and, as the quantity of reflected light increases with the angle of incidence, it may be seen how the reflected sunlight illuminates in the highest degree the night skies of the region nearest the pole, and, further, the great similarity of the incipient light of the aurora is explained, thus, the latter being also sunlight reflected.

As to the idea that the point of origin of the aurora is indicated by the direction of the magnetic needle, it is claimed, rather, that a line drawn from the sun at right angles to the horizon and prolonged would be the middle line of the phenomenon.

A recent scientific writer refers to the many attempts which have been made to fix the height of the aurora borealis, the various calculations presenting a discouragingly wide range of estimates. At times the aurora seems to rest upon the earth; at other times it has been estimated at two or even three hundred miles high. Later and more careful experiments with improved instruments render it quite certain that 38 miles is probably the height at which the most brilliant auroras take place; that a pale and faint glow may possibly be produced as high even as 82 miles, but that no aurora discharge is possible at a height of 124 miles.

LARGER THAN THE LICK TELESCOPE.—It is reported that a Los Angeles gentleman has been corresponding with the Clark Brothers of Cambridgeport, Mass., in regard to constructing a large telescope for the University of Southern California—one that shall be furnished with an object-glass 50 inches in diameter—larger than that in the Lick instrument. The gentleman is reported to have received a letter from the Clarkes in which they say that they are now quite certain that discs of glass more than 40 inches in diameter can be obtained with a reasonable number of experiments

or trials, and that with their (the Clarkes') experience he would undertake to make and mount a telescope with a 40-inch objective, a photographic lens, spectroscopic apparatus and everything complete for the sum of \$80,000. This was not possible when the Lick instrument was ordered, but has been rendered possible within the last three years. With such an instrument mounted upon an isolated mountain such as Stanford, Whitney, San Antonio, San Jacinto or San Bernardino, 10,000 feet above the sea, much more marvelous results may be expected than the 36-inch objective of Mount Hamilton at 4300 feet elevation has or possibly can reveal.

AN ANCIENT MANUSCRIPT TO BE REPRODUCED. The trustees of the British Museum have given directions that the *Ani* papyrus, a remarkable recension of the "Book of the Dead," shall be reproduced in facsimile, with the illustrations in the colors of the original, and the work is now being executed by Mr. Griggs. This hieroglyphic papyrus was written for a royal scribe, Ani, about the commencement of the 19th dynasty—*circa* 1400 B.C. It is complete, the first and last vignettes being intact. The series of vignettes is a mine of archaeological information; their artistic excellence is equally great. The papyrus contains a chapter of the "Book of the Dead," the 175th, not found complete elsewhere. Also one of the illustrations, a group of lamenting women in violent action of grief, is unknown to any hitherto published copy of the book. It is expected that the reproduction will be completed in the course of the autumn.

NORTH CAROLINA'S UNDERGROUND RIVER.—Reports from Whiteville, the county-seat of Columbus county, North Carolina, state that the citizens are much wrought up over the supposed discovery of an underground river. It is stated that the roaring and rushing of water can be plainly heard in the vicinity of the supposed stream, and that upon placing the ear to the ground "the phenomenon becomes alarming." A press dispatch says: "The sound indicates that the water is not any great distance down, and that it is not a small stream, but a majestic river that is coursing unseen in the bowels of the earth on its way to the sea. Vehicles passing the ground where the phenomenon exists, create a hollow echo from below, and the earth in the vicinity for a great distance around seems to be cavernous, judging from the sounds that follow sharp blows."

EFFECTS OF SOAP IN GEYSERS.—Dr. R. W. Raymond read a paper before the late meeting of the Institute of Mechanical Engineers, at Buffalo, on "Soaping Geysers." It appears that his attention was called to the subject by the story of a party of returned tourists, who told him a story of a Chinese laundryman who set up a washing establishment at the National Park geysers directly over a hot spring, intending to utilize the hot water in his business. On one occasion, having thrown a lot of dirty linen, thoroughly "soaped," into the spring to soak over night, the celestial was very much surprised when the waters of the spring, having become stimulated by the soap, suddenly became a spouting geyser, and forced up with a rush a large quantity of hot water, completely wrecking his establishment and thoroughly demoralizing its owner.

THE RETROCESSION OF NIAGARA FALLS.—At a late meeting of the Institute of Mining Engineers, held at Buffalo, Dr. Julius Pohlman presented a sketch of his views on the "Life History of Niagara Falls," in which he took the ground, elaborating his evidence, that the falls have not cut their way back from Lewiston, but from a point about Whirlpool Rapids. He also condemned the opinion so generally held that the falls moved upward at a slow rate, by showing that between 1841 and 1886—45 years—the first and last surveys made, the Horseshoe Falls went back 455 feet, or at the rate of about nine feet a year. The doctor's address was received with much attention and favor, and he was urged to present his paper in fuller form to be embodied in the published transactions of the association.

STANDARD TIME has been so thoroughly introduced in this country and the benefits of uniformity in this respect are so much appreciated now that it seems strange that other countries delay to adopt a similar system. In France, Paris time is supposed to be kept on all the railways, but as a matter of fact, it is said that each company sets its clocks according to its own standard, while different localities still keep up the absurd idea of "local time," which in fact still prevails in some conservative places in this country. An effort is being made in France to bring about the adoption of uniform standard time, which would not seem difficult to accomplish in a country so small compared with our vast continent.

SUBMARINE TELEPHONY.—The French have made experiments in submarine telephony at Brest. The instrument used is the invention of M. Barrat, who has called it the hydrophone, which, roughly speaking, is simply an ordinary microphone, arranged so as to equalize the water-pressure in both sides of the diaphragm. The experiments have, to a certain extent, been successful, as under the most favorable conditions the sounds produced by such instruments as bells, whistles and trumpets, were heard at a distance of 5700 yards.

USEFUL INFORMATION.

MAKE YOUR OWN ICE-CREAM.—Ice-cream is a luxury which is greatly appreciated during the warm months. An ice-cream freezer costs about two dollars and a half, and once that is bought, cream can be made at home at very little expense. The trouble of preparation is not nearly so great as is often supposed, and the result is so satisfactory that those who are fond of ice-cream are advised to try it. Besides the freezer a wooden mallet for pounding ice and a stout canvas bag to pound the ice in are indispensable. To make the cream, use one pint, good measure, of rich milk. Let this boil, then mix together two tablespoonfuls flour, one capital sugar and four or five eggs. Beat these very lightly and stir into the boiling milk. Cook 20 minutes and set away to cool. When ready to freeze, add one quart of cream, if you have it, or one pint of cream and one pint or quart of milk. Put this in the freezer. Pack the tub full of pounded ice and salt, using about 2½ pints of salt evenly distributed through the ice. Turn the handle of the freezer slowly at first, and very rapidly for the last few minutes. In about 20 minutes you will have a nice ice-cream. Take out the heater, put on the cover, being careful to put a cork in the place where the heater goes through. Put a blanket or piece of old carpet over it, and by putting the freezer in a cool, dark place it will keep several hours without any more ice. A great many persons spoil ice-cream by fussing with it. If it is let alone it will keep all right if the above directions are carried out.—*Ex.*

ARTIFICIAL SILK.—There seems to be a possibility that an artificial substitute may be found for the product of the silkworm. A. Paterson, N. J., silk manufacturer recently said: "It is by no means impossible that artificial silk may some time replace the product of the silkworm's labor. That, of course, is only a possibility and not a probability, but it is very probable that artificial methods will replace the tedious and expensive means now employed to utilize the worms. It has for some time been known that worn-out silken fabrics can be utilized by putting them in a chemical bath which separates foreign substances from the silk itself, and saves the latter in a solution. This solution can be respun or need to plate other thread. Now, as I learn from France, Dr. Chardome of that country has succeeded in making a purely artificial silk. He makes a solution of nitro-cellulose, alcohol, ether, ferrous chloride and tannic acid, in nicely calculated proportions, and runs it from a reservoir through an exceedingly minute hole into a bath of water, acidulated with one-half of one per cent of mono-hydrated nitric acid. The fluid hardens in the water, and is dried in hot air. It is said that the thread can be readily dried, but I do not know what other valuable qualities it has."

AN ELECTRIC CARRIAGE for common roads has been patented in England. A pictorial representation of the device, which is given in the English papers, shows a common wagon or carriage body on springs. In appearance the vehicle does not differ much from an ordinary four-wheeled vehicle with the shafts removed. The motor is placed in the center of the body of the vehicle. Motion is communicated to one of the hind wheels by means of a small pinion on the main shaft of the motor working into a pitch chain, which passes over a series of L-shaped plates attached at intervals to the inner face of the wheel, so as to constitute in effect a driving pulley for the pitched chain to act upon. The motor can be reversed so as to back the vehicle. The power is stored in 24 small accumulators of special type, occupying the space under the seats, and said to be sufficient to propel the vehicle at a speed of about ten miles per hour for five hours. The steering is effected by a shaft projecting through the foot-board and operated with a hand-wheel. A brake is also attached, worked with a lever.

PAPIER MACHE COVERING FOR PULLEYS.—An ingenious method has been patented in Nottinghamshire, England, which consists of a papier-mache covering applied to pulleys in any ordinary driving by means of a chemically prepared cement. So firmly does this covering adhere to the face of the pulley, that after being in use a few hours it becomes an inseparable part of the pulley. An advantage is that this covering can be fixed on pulleys in use, without disturbing any part of the fittings or causing any loss of time by the machine being idle. It only requires 10 hours to set, and no riveting is needed. What is claimed for the covering is that a machine will produce more work, the belts will last longer, as they are not subjected to so much strain caused through enacting, dust, oil and steam having no effect on its gripping power, and it saves loss of power, as it prevents all helts from slipping.

HOW GLASS LAMP CHIMNEYS WERE INVENTED.—Why is it that the glass chimney makes such a difference to the light given by a lamp? Because it increases the supply of oxygen to the flame by producing a draught, and concentrates and reflects the heat of the flame, in consequence of which the combustion of the carbon is more perfect and very little escapes unconsumed. Lamp glasses were invented by Aime Argand, the inventor of the famous lamp which bears his name. He had

been experimenting for some time to increase the light, but to no purpose. On the table before him lay this broken neck of an oil flask. This he took up carelessly, and placed it almost without thought over the wick. A brilliant flame rewarded this act, and the hint was not lost upon the experimentalist, who proceeded to put his discovery into practical operation at once.

TO POLISH TINWARE.—For general use an old cloth will do, or rub the article over oil, then sprinkle on whiting, and then polish with a cloth. If the article to be polished is round, and it is desired to have it look like lead, then rub up and down; if it is wanted to look like silver, then rub around the article. Fancy spots can be put on tin by covering the thumb with the polishing cloth, and then give the thumb a circular motion on the tin. The result is difficult to describe, but it is very effective. The manufacturers of brass (musical) instruments use Venetian lime for polishing, but for the requirements of the tinner, whiting, when properly applied, should answer all reasonable purposes.

SHARPENING TOOLS.—It has often been said, of late, that glycerine is much better than oil for sharpening tools; but the fact that it should be mixed with a small quantity of oil is not as often heard of. The proportions of the composition should be made according to the class of tools to be sharpened. One with a relatively large surface is best sharpened with a clear fluid, three parts of glycerine being mixed with one part of spirits. A graver, having a small cutting surface, only requires a small pressure on the stone; in such cases, mix the glycerine with only two or three drops of spirits.—*Ex.*

HEBREW MANUFACTURERS.—The *Jewish Gazette* of New York says: In the clothing trade there are 241 manufacturers in this city, of whom 231 are Hebrew firms. Over 600,000,000 cigars per annum are manufactured in New York by Hebrew firms, employing over 8000 hands, and whose yearly transactions reach \$15,000,000.

FOR REMOVING OLD VARNISH.—A mixture for the removal of old varnish has been patented in Germany by a Mr. Meyer. It is obtained by mixing five parts of 36 per cent silicate of potash, one of 40 per cent soda lye, and one of sal-ammoniac (hydro-chlorate of ammonia).

A NEW STEAM STREET CAR.—In the trial of a new steam street-car in Sweden, the cost of fuel is said to have been only about two cents per mile. The car will seat 24 passengers, the engine being in one end of the car.

GOOD HEALTH.

YELLOW FEVER.—GETTING CONTROL OVER IT. All scientific medical men agree that no reasonably sure cure for yellow fever has yet been discovered. This fact is what causes the scourge to be regarded with such popular terror. Still, the record of the ravages of the plague in Jacksonville, Florida, this season shows that medical science has done much to lessen the mortality among patients. The deaths in nearly 4000 cases are only about nine per cent of the whole number, showing that with reasonable care and skilled medical treatment, the average patient has nine chances in ten of recovering. In former years, the mortality was proportionately much larger, in some visitations of the disease the deaths being fully 25 per cent of the number of those taken down. Considerable comfort may be derived from these facts, for they go to prove that in a measure yellow fever is succumbing to enlightened scientific treatment. Some idea may be derived from a comparative study of the death-roll among the smallpox patients during the prevalence of that disease in this city last winter, and the deaths in Jacksonville. The smallpox patients in San Francisco numbered just about one-tenth of the yellow-fever patients in Jacksonville, Florida, and the death rate was about nine per cent, showing that the smallpox here was proportionately as fatal as is the yellow fever in Florida.

TOUGH FRUIT SKINS.—The skin of plums is wonderfully strong compared with its thickness, and resists the action of water and many solvents in a remarkable manner. If not thoroughly masticated before taking into the stomach, this skin is rarely, if ever, dissolved by the gastric juice. In some cases pieces of it adhere to the coats of the stomach as wet paper clings to bodies causing more or less disturbance or inconvenience. Raisins and dried currants are particularly troublesome in this way, and if not chopped up before cooking, should be thoroughly chewed before swallowing. If a dried currant passes into the stomach whole, it is never digested at all.—*Popular Science Monthly.*

EARS INJURED BY SEA-BATHING.—The past week my office has been filled with seaside victims, many of them being children (said an aurist yesterday). People who have the "nummering away from home" on the brain take their little ones with them, and if the sea coast is sought the poor child victims, especially girls, are forced against their will into the water to fight the breakers for the benefits accruing from the fashionable sea-baths. Little girls have a natural aversion to entering the

sea. They are fearful of the waves, and it is highly injurious to their nervous system to force them to it. But the reason they are brought to me now for treatment is the injury done to their ears and hearing from not only the shock of the roaring noise affecting the acoustic parts, but the salt water having entered and filled the ears, and seriously injured the drums, in many cases producing inflammatory symptoms. Of course, often we can cure them in a short time, but again permanent ill is accomplished. In any event the sufferers, either temporarily or permanently injured, must endure a great deal, not only pain, but the incessant roar in the ears, which resembles in effect a too great quantity of quinine taken into the system. If parents will bring their children with them to the seaside, they must either watch them very closely while sea-bathing or prepare themselves for the dangers to the health that must follow.—*St. Louis Globe-Democrat.*

THE BEST WAY TO OBTAIN REST.—"In the progressive tendencies of the American people," said a physician to a reporter, "the subject of proper rest plays a very small part. The idea seems to prevail among them that this matter is subservient to all else—that it may be taken at any time and in almost any manner, provided there is nothing more important to do. Only this morning a lady consulted me in regard to her health, complaining of a tired feeling, being scarcely able to attend to her duties, and all that. I diagnosed the case, but could discover no symptom of disease. She was simply suffering from want of proper rest. I told her what troubled her, and no doubt she went away convinced that I did not understand her case. A man or woman, particularly the latter, will become tired, and being firmly convinced that everything will go wrong if she stops work, busies herself with some other occupation, or, if exhausted, will throw herself in a chair or upon a lounge with a book or paper and try to restore strength in that way. This is not rest. It only creates a longing for it. The true way is to lie at full length upon a mattress, or any equally hard surface, using no pillow, with arms extended and eyes closed. Dismiss for the time all care and seek only rest. This will bring to an exhausted body the refreshment and contentment which no amount of medical advice or skill can predetermine."—*N. Y. Mail and Express.*

AN INTERESTING QUESTION.—William McNamee, in an article which lately appeared in the *St. Louis Globe-Democrat*, says: I have noticed that there is a difference in the hearing of people in general in the different seasons of the year. There are men who walk erectly and who hold their heads high in the winter. Take these same men in the summer, and there is a very perceptible droop to their shoulders and an inclination of the head forward. In the winter this defect in their carriage will have been remedied and they will walk as straight as ever. I have studied the matter with much interest, but whether it is due to a general loss of stamina from the system by reason of the heat, or whether it is a natural instinct of the man to protect himself, his face and eyes, by leaning forward, I have not determined. It may be due to both causes, or may not be caused at all. At the least it is an interesting question.

ANOTHER ALLEGED CURE FOR WHOOPING COUGH.—Dr. Mohn, according to the *Revue Mensuelle des Maladies de l'Enfance*, May, 1888, claims that he has in a number of cases produced instant and permanent cure of whooping cough by fumigations with sulphur. His method of procedure is as follows: In the morning the children are clothed and removed from their sleeping-room, in which are hung all the clothing, toys, and, in fact, everything with which the children are brought in contact. In this room about four ounces of sulphur for every cubic yard of space is ignited, and the sulphurous acid allowed to remain in the room for about five hours. The room is then well aired, and the next evening the child sleeps in a room and bed which has been completely disinfected, and it is said that cure is at once produced. As to whether this will be attained in all cases, we do not presume to state.

FOR THE FEET.—From Germany comes information for policemen, carriers, collectors and others who are on their feet a great deal. Chafed, sore, or blistered feet may be cured by the use of a powder which is a necessary part of a German army equipment. It is known there as "Feustrenpulver," and consists of three parts salicylic acid, ten parts starch, and 87 parts pulverized soapstone. It keeps the feet dry, quickly heals sore spots, and prevents chafing. A powder of pulverized soapstone is also good.

WALKING UP STAIRS.—An Albany physician once gave a lady patient the prescription: "Stop walking up and down stairs." The only way the prescription could be taken was to vacate the three-story and basement house in which she lived. Her husband owned a roomy cottage of two stories, and within a year the invalid's health was almost completely restored.

MOST PEOPLE regard an elevator as more liable to cause accidents than a flight of stairs; yet during the year, 18 Boston people died from falling downstairs, while but ten were killed from elevator accidents.

ENGINEERING NOTES.

The Rival Isthmus Canals.

Our frequent references to the Panama canal afford very good evidence that the scheme is one of exceedingly doubtful consummation. However competent and honest M. De Lesseps may be, and we think no one questions him in either respect, it is a matter most apparent that the whole working portion of the enterprise has been an engineering blunder from the start, and that it has been conducted in a manner totally regardless of economy. It is perhaps quite safe to say that one-half of the \$150,000,000 expended has been fairly thrown away. It is this feature of the enterprise that is now keeping capitalists away from it. Even those who have already largely invested and have abundant means to continue such investments are holding back, preferring to lose what they have paid in rather than take the risk of further investment in such a badly managed scheme. The *Economiste Francaise*, the leading financial journal of France, says the enterprise is on its "last legs."

The *Engineering and Mining Journal* of New York says of the several recent manifestoes of M. De Lesseps: "It is lamentable to read such bombast uttered by a man who has so justly and gloriously distinguished himself as an engineer, and although it may be only a French method of reassuring frightened shareholders, it seems to us like a deliberate perversion of the truth. There is not the least probability nor even possibility of the Panama canal being completed by De Lesseps or by any one else at a cost, including past expenditures, that could possibly make a remunerative investment. It is becoming evident to every one, except De Lesseps, that every franc expended up to this time will be absolutely lost to the investors."

Meanwhile the work of the Nicaragua canal goes on in a quiet and more business-like fashion, and on the 9th inst. the contract negotiated at Washington, between the Special Envoy of Costa Rica and the President of the Nicaragua Canal Association, was ratified by the Congress of Costa Rica, and signed by the President of that republic. This scheme is not nearly so pretentious as that of Panama, and if executed in an economical and business-like manner will possibly pay a moderate return on the investment, which will be but a small part of that at Panama, while it would 'divide the business' with that canal were it ever completed, and thus halve the receipts, which, taken altogether, even the exuberant imagination of De Lesseps is unable to show, would pay interest on the Panama investment."

The *London Financial Times*, in comparing the two enterprises, says: "If the (Nicaragua) canal is completed at anything like the estimated expenditure, there appears no manner of doubt that it will prove a gigantic financial success. Overloaded with the burden of an enormous capital, the Panama canal is likely to prove but a poor rival."

The same paper expresses the opinion that "32,000,000 tons of English shipping would find its way yearly through the Nicaragua in preference to the Panama canal in addition to the huge commerce of the United States." It further says: "But incalculable as the advantages would be to England, it is probable that the United States would benefit to a still greater extent. * * * It is very probable that the British public will have an opportunity of investing in the canal, as we hear an English syndicate has already agreed to purchase a part of the stock."

THE HUDSON RIVER TUNNEL.—This tunnel under the Hudson river, which was started several years ago by several California capitalists, seems to have recently passed largely under English control, and its new projectors are working hard to get their bonds on the home market, and are paying for column advertisements in the London papers calling attention to the desirability of the investment. Just now the issue on sale is termed a first mortgage, five per cent gold security, and amounts to but \$1,500,000. Payment is to be made in installments up to January 1st next, at the rate of £180 for \$1000. Interest is guaranteed up to January 1, 1893. It is incidentally mentioned that \$8,500,000 more of the first mortgage bonds are to be issued upon the tunnel before its completion. The advertisements state that the charge for passenger traffic through the tunnel will be five cents per head, and estimating on a basis of 30 per cent of the passengers and five per cent of the freight now crossing the North river as the business of the tunnel, its projectors figure out a net profit of more than three times the amount required to pay the interest on the whole \$10,000,000 of bonds proposed to be issued. The permanent terminus of the tunnel, it is stated, will be at Broadway, 16 feet below the surface, on the New York side, and at Fifteenth street, Jersey City. It is proposed, however, to begin carrying passengers as soon as the part of the tunnel under the river is completed, using temporary terminals until the permanent ones are ready.

THE EADS TEHUANTEPEC SHIP RAILWAY contract has been given to the Atlantic & Pacific Railway Company, the work to be completed in five years. The Mexican Government has made liberal concessions, and this road is thought likely to be in operation before the De Lesseps or Nicaragua canal can be completed.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

AMADOR GOLD MINE.—*Ledger*, Oct. 20: At the Amador mill the retaining wall is finished. All the battery blocks are in position and well tamped. The battery blocks are of fine sugar-pine, selected with care. J. B. White & Co. are ready to commence erecting the framework of the mill, and will start at it to-day. They have the work well in hand and will make good progress from now on. They say they will make it one of the best mills in the State. At the mine considerable work is going on. The mine is fast getting into shape to supply ore to the mill. A new blacksmith shop is going up. It will be fitted with conveniences for making cars, skips, and doing other mine work. The automatic shut-off, made by Knight & Co., attached to the compressor pipe, does good work and is an excellent arrangement for saving water-power. Two machine drills are kept steadily at work. Another drill will be started Monday. Last pay-day this company paid out \$11,000 besides payment on mill.

SUTTER CREEK.—S. D. R. Stewart is having a six-stamp mill built—two batteries of three stamps each—to place on the Leggett & Manditch claim that he has recently purchased, about five miles east of here. He intends to get the mill running as soon as possible.

Fresno.

A RICH PLACER CLAIM.—*Fresno Republican*, Oct. 20: About the 8th of September William A. Bell located a placer claim on King's river, about three miles below Trimmer's Springs, in the Sacramento district, some 40 miles east of this city. He has since that time prospected the claim thoroughly, taking out of the prospect holes \$20 worth of very beautiful coarse gold. The claim is on the north side of the river and comprises a small flat of about 30 acres. Water can be brought upon it from the river, and as there is a good deposit of yellow clay on top of the bedrock, the whole claim can be ground-sluiced successfully. One chunk of pure gold shown weighed about \$5, and everything goes to show that the claim will prove one of the richest ever worked in Fresno county. Mr. Bell has sold a half-interest in the claim to E. S. R. Mainwaring, and they started yesterday from this city, fully equipped to commence active operations on their property. The flat was located years ago by Chinese, but as there was a bitter antipathy against letting those people get a foothold on Kings river, they were not permitted to work the claim. Upper Kings river has been only meagerly prospected up to the present time, although considerable placer mining has been carried on at different points along the stream for 20 years past. We believe that this new location will have the effect of stimulating other prospectors to seek good finds, and if they look for them persistently there is every reason to believe that their efforts will be crowned with success.

ASBESTOS.—A. L. Bartlett of Pine Flat has discovered on the north side of King's river, about 35 miles from the City of Fresno, a ledge of asbestos, about 18 inches in thickness. The find is pronounced by experts to be of the best quality and worth about \$35 a ton.

Inyo.

PANAMINT.—*Inyo Independent*, Oct. 23: At Panamint 20 men are at work. Nearly all are prospecting claims on their own account. It is said that everybody is getting out ore and making fair wages. A run has been finished at the mill, but the result has not been reported. It is believed, however, that the returns will be very satisfactory.

AT LOOKOUT Frank Fitzgerald is doing very well. He is getting out a good deal of ore, nearly all of which is rich enough to ship. He is also concentrating tailings and flue dust at the rate of ten tons per day; this is concentrated to four tons and shipped. It pays well.

DARWIN.—The Defiance mine, at Darwin, continues to look very well. A ledge is now opened that runs about four feet wide, and more than half of this is pure galena ore. For the first time in the history of the mine native silver is now found in the ledge. Ore shipments are now made regularly.

CERRO GORDO.—More silver ore is being shipped from Cerro Gordo than from all the other camps in the county combined.

FINDS.—Some very promising ore finds have been made during the past ten days in the Inyo mountains, east from Independence. A wood-chopper discovered a ledge, the outlook of which is very favorable. Some days later J. W. P. Laird, Register of the Land Office, made a trip to the same locality accompanied by Sam Gruber, an old prospector. They brought in some very rich looking silver ore. Mr. A. Davidson has found some still richer specimens in the same region. In all of these cases there are good indications of the ore bodies being of considerable extent. It has always been held by mining men that the Inyo range to that locality only needed prospecting to develop a very rich mineral region.

CERRO GORDO.—*Register*, Oct. 16: The outlook for a revival in mining at this camp, says a correspondent, is better than it has been for nine years, or since the Union Con. shut down. Negotiations are pending whereby an Eastern and London Co. will mine some of the best properties on an extensive scale.

A NEW STRIKE.—*Inyo Index*, Oct. 20: W. H. Russell, superintendent of the Lone Pine Mining Co., was in town on Monday last. He informs us that a two-foot vein of fine-looking ore has just been found in the San Carlos mine near Independence depot. The value of the ore has not been ascertained, but its appearance is quite promising.

Los Angeles.

CORA BELLE.—*Newhall Times*, Oct. 20: Surveyor Gavin is at the Cora Belle working on the new hydraulic system. A mammoth reservoir is to be constructed and water piped on to the mineral ground, and the claim will be sluiced out. Great returns are expected, for the mine is wonderfully rich. The El Dorado mine in the San Francisco canyon now assays \$44 in silver, with good tracing of copper. A shaft will be sunk into the ledge and

better ore is expected. This is owned by McDuffee, Smith & Kichline. The American Eagle, about four miles above the El Dorado, goes \$23 in silver on the outcroppings. The Shkel mine is a little farther up and assays \$7 to \$77 in gold and about \$2 in silver. The ledge is about 40 feet thick, of white quartz, and is alongside the main road to Elizabeth lake. The gold is very fine, minting from \$19.50 to \$20 per ton. The Central Confidence and Conclusion are in the vicinity and are of about the same grade as the Shkel. They are all owned by Richard Kichline. Rudd & Heilig expect to get their dry-washers up and working to-day. They will mine on the Smith claim in Placeritas canyon first, and then will work on a royalty or lease all the land they can get. The firm put great confidence in their washer.

FINE GRAPHITE.—*Los Angeles Herald*, Oct. 20: There is on the writer's desk in the *Herald* office a piece of as fine graphite as there ever was taken from the ground perhaps so near the surface as this comes from. An assayer of this city finds that it contains 82½ per cent of pure graphite, and the rest is "grit," probably lime. This mineral comes from the mountains near Newhall in the San Francisco canyon, Los Angeles county. It lies 18 miles distant from the Southern Pacific track. The ledge is owned by Messrs. Liddell, Hoy and Lane, who have a prospective fortune in their find.

Mariposa.

BONDED.—*Mariposa News*, Oct. 20: Judge Walker has bonded the Grove & Ellingham mine, at Whitlocks, and will commence to develop it at once; he will also commence cleaning out the tunnel of the Whitlocks mine.

BEAR VALLEY.—Work on the Pine Tree still continues. On Monday the tunnel had been run 94 feet on the vein. The ledge will average 6 feet of milling ore that will go \$3 to the ton. The ore in the face of the drift at last accounts was good for \$20 to the ton.

AT WHITLOCK.—*Mariposa Gazette*, Oct. 20: Good news reached us that Judge Walker is preparing to commence work opening the Whitlock mine as soon as conveniences can be provided for his employees upon the surface. The mine is an old one which was worked from 30 to 40 years ago. The old shaft tunnels and drifts are all more or less caved in and filled up, which will, no doubt, cause considerable deadwork before the main body of ore can be reached. The last work done upon the mine of any importance, as well as we can recollect, was by the Marshalls about 20 years ago. Capt. Diltz, who still lives, knows the character of the Whitlock mine and the Spencer vein, which is a part of the same property, better than any man living. The captain frequently alludes to his early workings and that in one run of 100 tons they took out \$10,000. He still holds to the opinion that it is one of the best mines in the county. The only trouble and drawback to this as well as other mines in the same vicinity is the need of fuel and want of water. Still other mines in the same vicinity are opening up and developing good ore, which the parties at this time are grinding on a small steam-mill. Mr. Ellingham and Johnnie Grove are the owners of the mill. Another mining company, the Helm Bros., are close by extracting rock from a vein of quartz rock which they have clung to for several years.

Monterey.

LOS BURROS DISTRICT.—*Cor. Monterey Democrat*, Oct. 16: In the Cruikshank tunnel it is reported that they have struck some small stringers of rich quartz, but the main vein is supposed to lie quite a distance farther ahead yet, but as the ground is softer and driving ahead is easier, they will know now in a week or two whether we have a fall boom or not. The King tunnel is in very favorable ground for ore. They have struck blue slate with quite a stream of water flowing from the face—a sign that the vein is not far off. The Ajax mine is idle just at present. To-day one of the owners took several samples of ore from the vein in the northeast crosscut, which, out of six samples mortared up, five prospected fine, showing quite a lot of gold. The crosscut is about 150 feet from the mouth of the tunnel and 50 feet from the face of the tunnel. The annual assessment work is being done on several of the most prominent locations—the Aina, Mammoth, Manzanita and others. Jones & Flood have found good prospects on the Plum Knight. On the Manzanita they have sunk an incline down about 15 feet and have a well-defined ledge of over 2 feet of fine quartz which prospects high.

Naba.

SILVER.—*Calistogan*, Oct. 17: R. F. Grigsby of the Palisade Mining Co., near Calistoga, received a diploma at the Napa fair for an exhibit of mineral ores and a silver bar. The specimens were rich and attracted a great deal of attention. The silver bar, or brick, was the most striking proof of what is being done in the mines near Calistoga. The bar was of the size of those now shipped from the Palisade mines to San Francisco, and its value was nearly \$2000 in silver and gold. It occupied a prominent point in the pavilion. It represented the beginning of an industry here that before long will be of great value to the county.

Nevada.

DEVELOPING WELL.—*Nevada Herald*, Oct. 20: The Washington mine situated on the Bloomfield grade above Edwards' bridge, which was located about a year ago by J. R. Tilton and his son George, is said to be developing well. When the locators first went to work there everybody thought they were on a wild-goose project and the matter was referred to in a jocular manner. They have stuck to it, though, through many discouragements, and it looks now as if they might be rewarded for their perseverance. They have interested outside capital in their project, and some rock has been taken out which is reported as having yielded good returns from milling. R. F. Pixley is here representing the capitalists and has several men at work. Henry Richards was engaged to-day to go out and act as foreman. From a blast that was set off yesterday some good-looking rock was obtained. A tunnel is to be run into the mountain-side at a level considerably lower than where work has hitherto been done to determine the extent of the prospect.

SPENCEVILLE COPPER MINE.—*Herald*, Oct. 16: Last spring Messrs. Chas. Pietzsch and O. Wochler purchased the property of the San Francisco Copper Mining Co. at Spenceville, paying therefor the sum of \$9500. Since the purchase they have been

engaged in leaching over the old ore-piles and are extracting about 10 tons of copper per month, which is 80 per cent fine, and which brings, in that state, \$225 per ton, or, if smelted and made pure, it sells for \$320 per ton. Of pure bar copper the yield is about eight tons per month. There are immense piles of this old ore which was extracted by the San Francisco Co., and which will take quite a long time to work over.

THE OMAHA AND LONE JACK.—*Tidings*, Oct. 22: To-morrow the new eight stamps at the mill of the Omaha and Lone Jack Consolidated will begin to drop and to pound out gold from quartz. A Pelton wheel replaces the bulky wooden overshot which formerly drove the original ten stamps, and other improvements have been made. Supt. Mainhart reports the outlook at the mine to be very favorable. He expects to keep busy night and day, the mill's full complement of 18 stamps on ore of good quality. All underground operations are conducted through the Omaha shaft. This property is also one that yielded largely in bygone days and was subsequently abandoned as worked out. It is quite likely that dividends are yet in store.

MILL COMPLETED.—*Transcript*, Oct. 23: The Bryan roller-mill at the Erie mine has been completed and everything is in readiness to commence crushing. The mill contains three rollers, each of which weighs 3600 pounds, and is shod with a steel tire six inches wide. The crushing is done by the attrition of these rollers in passing over the quartz, and it is claimed that this mill will reduce to powder 40 tons of quartz each 24 hours, and that it will crush 18,000 tons before any repairs are needed.

Placer.

FOREST HILL.—*Placer Argus*, Oct. 20: The gravel mines in the vicinity of Forest Hill are showing up well and those who are in a position to know claim that the palmy days of the past will be re-enacted, and that the mining industry will be revived. There is unquestionably good territory in that section, and all that is required is capital to develop it. The Valentine Bros., who recently purchased the Hathaway mining property will soon erect a mill and commence work in earnest. This property is well developed, and under good management will become a heavy bullion-producer.

IOWA HILL.—*Cor. Placer Republican*, Oct. 19: At the Pioneer quartz ledge the tramway is completed to the mill-site, and the machinery for the mill is on the ground ready to be put in position. The indications in the Blue Wing drift are good. A four-ounce specimen was found there last week. The Watts Bros. took out 75 ounces in their mine at Monona Flat during the last six days.

San Diego.

TEST OF ORE.—*National City Register*, Oct. 16: Superintendent Chick of the reduction works has been very busy during the past week making mill tests of ores sent from Arizona and the country immediately surrounding us. A surprising result was obtained from a piece of rock about a foot square, taken from a ledge not 30 miles from National. A trifle over \$100 in gold was taken from it. Three tests were made from Arizona ore the other day that caused Supt. Chick to open his eyes in great surprise. The first lot milled \$80, the second, \$180, and the third brought forth the astounding lump of \$9500 to the ton. This ore will be sent here as soon as the works are ready for business. Mr. Chick shows the bullion, but refuses to state to whom it belongs.

Siskiyou.

RIVER MINING.—*Yreka Journal*, Oct. 20: The Centennial Co. has pulled out its machinery from the Klamath river, having worked out their last cut, as it is too late in the season to remove to a new cut before the winter rains commence. All the other companies in the Honolulu district of the Klamath river are still working their claims constantly, day and night, with expectation of continuing operations energetically until the winter freshets force them to pull out.

Tuolumne.

ALONG THE EUREKA LODGE.—*Tuolumne Independent*, Oct. 13: The Eureka Consolidated at Summerville is giving a boom to the camp, with every indication of being a permanent thing. The mine is one of the largest gold-bearing lodes in the county. It is at present the only one being worked of the several mines that stand on a celebrated line of gold-producing rock, which was the pride of Tuolumne in the days of a bright and happy past. Below are given a few notes on the string of extensions, some of which set the public pulse throbbing with excitement 25 or 30 years ago: Commencing on the south end and running north, the first on the list is the Consuelo, the property of D. B. Warfield of Oakdale. The mine stands 1000 feet up the steep hillside above the Tuolumne river. In the early '60s this was classed as the mine of mines, in what was known as the McCarthy shaft the miners taking out a six-foot ledge that milled \$800 per ton. Work was suspended on the property in '66. The Bonita, the next on the line, was never worked to such a great extent as some of the others, but was considered a fine claim in its day. The mine is now in the possession of Williams & Guion, the steamship firm of New York. In 1859, Messrs. Soulsby, Bradbury, Johnson and "Big" Benjamin opened up a prospect, afterward famous as the Grizzly. Miners of experience claim that the mine was never half worked and that plenty of first-class rock is to be found in it now. It is now the property of Wm. Sharwood of Soulsbyville. The next is a mine owned by the Richards Bros. of Sonora, and which has been the property of the family for the past 25 years. It might be termed merely a prospect, as comparatively little work has been done. Rock that paid well has been taken out, but the vein was broken up and cut by a lime reef. The claim adjoining the Richards is the Lady Washington, located in 1858, and now controlled by Mrs. E. Dorsey of this place. It was called a good one in its day, and a good chute is said to have been left. The Eureka Con. is a consolidation of the Dead Horse and Eureka, discovered in '59 or '58 by Messrs. Inch, Edwards and the Blakeleys. The mine has been a famous one, and, from present indications, is likely to out-hine its former glory. Improvements are constantly going on, a large force of men is employed and the 20 stamps of the new mill hammer merrily away on paying quartz, of which it has enough in sight to keep them busy day and night for the next 10 years. The mine is owned by Hayward, Hobart & Co. With the exception of the property mentioned, all these

mines have been lying idle a number of years. Nearly all these mines have had in connection valuable plants, including mills, hoisting works, boarding-houses, etc., but the late fire in that district swept everything away. Now nothing is left but the developed ledges; these vary from 3 to 25 feet in width, average about five feet, and will mill \$6 per ton for every ounce of rock between the Consuelo and the Eureka.

NEVADA.

Washoe District.

CON. CAL. AND VIRGINIA.—*Enterprise*, Oct. 20: From the stopes on the 1400 and 1435 levels the usual quantity and quality of ore has been extracted. On the 1500 level are stoping ore from the parallel north drift, 60 feet north from the upraise above that drift. Continue to stop ore from the southeast drift run from that upraise, 58 feet above the track floor of this level. On the 1600 level are stoping ore from two points. On the 1650 level are stoping ore of good quality from the east drift, run from the upraise carried up above the south drift from the east drift from the Con. Va. shaft, 86 feet above the track floor of this level. The winze going down from the end of the south drift is sunk 36 feet below this level. It is still in quartz showing some value. The usual amount of ore is being shipped to the mills on the river and in this city. The battery samples will be about the same as last week.

SAVAGE.—Since last report the southeast drift, 400 level, has been advanced 42 feet. Have resumed the extraction of ore from the north and south drifts on this level. On the 500 level west crosscut No. 1 has been advanced 51 feet. The joint east crosscut on the south boundary on this level has been advanced 53 feet. The last 8 feet of the drift is in good ore, car samples averaging \$50 a ton. Have started another crosscut at a point 70 feet north of the joint crosscut to intersect the northward continuation of the ore body found on the line. On the 950 level No. 1 east crosscut has been extended 38 feet. From the several levels are extracting about 50 tons a day, which is being shipped to the Rock Point mill.

POTOSH.—The south drift on the 650 level has been advanced 26 feet; total length, 486 feet. The face is in quartz and porphyry. East drift No. 2, 300 feet south of the north line, 650 level, has been advanced 13 feet; total length, 27 feet. The face is in low-grade quartz. The west drift from the 750 station of the Chollar and Potosi shaft has been advanced 24 feet; total length, 133 feet.

CHOLLAR.—East drift No. 2, 300 feet north of the south line on the 650 level, has been advanced 27 feet; total length, 51 feet. This drift is passing through quartz and bunches of ore. West drift No. 3, 300 feet north of the south line, 650-foot level, has been advanced 14 feet; total length 32 feet. The face is in clay.

CROWN POINT.—The main drift on the 700 level is out 90 feet beyond the west crosscut. A distance of 26 feet has been made during the week. The face is in a mixture of quartz, clay and porphyry. The connection with the Sutro tunnel is on the point of being made.

HALE AND NORCROSS.—Since last report the west drift on the 500 level has been advanced 52 feet. The joint east crosscut on the north boundary has been advanced 53 feet. The last 8 feet of the drift is in good ore. Car samples average \$50 a ton.

BELCHER.—On the 200 level the north drift from the shaft is out 46 feet. It is in a promising formation of soft porphyry. The 850 station is being repaired and repairs are being made to chutes. This work is about completed.

EXCHAMBER.—The northeast crosscut on the 382 level is out 172 feet. The face is in porphyry. The north central drift on the same level is in north from the Alpha shaft 434 feet. This drift is skirting along a heavy clay.
